NEW schools were opened at Eastwood, Yorks, on the 2nd inst., in connection with the handsome Wesleyan church which they adjoin, and with which they communicate by means of a covered way. The scheme includes a capacious assembly hall 65 feet long by 50 feet, with end gallery; infants' room, 22 feet by 18 feet; church parlour, 26 feet by 18 feet; classrooms, lavatories, &c.; providing accommodation for 650 scholars. The front is in rock-faced York stone with ashlar dressings, the sides and rear being of brick. The front gable has a semi-circular inset containing a triple window, and is flanked by buttresses carried up and finished with octagonal pinnacles. Under the centre window there are six round-headed windows lighting the lobbies and classrooms. The two main entrances are placed right and left of the front, each having spacious porches and lobbies, and that on the left being connected with the covered way above referred to. Light cast-iron columns support the roof on the clerestory principle, and between these and the outer walls additional classrooms can be provided if required. The roof is partially open, the main timbers being visible and ornamented with arched work, the ceiling being of pitch pine. All the glazing is in cathedral glass in suitable tints, and the front windows are in leadwork with squares and diamonds and borders. The internal joinery is of pitch pine. Efficient ventilation is provided by air inlets and an exhaust ventilator in the roof. The heating is by a low-pressure hot-water system, distributing heat to all parts of the building. The cost of the work, exclusive of land and architect's fees, is 2,800*l.* The architect is Mr. John Wills, F.S.Sc., of Derby and London; the builder, Mr. Richard Snell, of Rotherham.

## TENDERS.

### ALNWICK.

For quarrying, breaking, leading and laying-on of 450 cubic yards of 2½-inch hand-broken or 2¼-inch machine-broken whinstone. Mr. JAMES SHORT, district surveyor, Alnwick.

**ELECTRIC NOTES.**

THE Halifax Corporation tramways and electricity committees recommend that application be made to the Local Government Board for leave to borrow 28,000*l.* for the extension of the electricity undertaking, owing to the overloaded state of the present plant.

A CONTRACT to the value of half a million sterling has been placed with the Westinghouse Brake Company, London, by the Clyde Valley Electrical Company, Glasgow, for the equipment of their two generating stations which are to supply electrical power for industrial purposes over an area of 751 square miles. The stations will be ready in about eighteen months time.

THE new electricity generating station erected by the Colne Corporation at a cost, including plant and street cables, of 25,000*l.*, was opened on the 26th ult. The installation will provide current for 5,260 8 c.-p. lamps, and provision is made for current for a projected light railway from Trawden to Nelson through Colne. It is not expected that the scheme will be a financial success for a few years. Councillor Hewitt, chairman of the electricity committee, performed the opening ceremony, and subsequently entertained the Corporation at dinner.

AN electrical exhibition, under the auspices of the Brighton Corporation, was opened at Brighton Aquarium on the 4th inst. One of its objects is to arouse interest in electricity by affording practical illustration of the many ways in which it has been brought by modern science to minister to the comfort and convenience of mankind. A striking transformation has been effected in the building; the corridors of which are filled with stalls at which are illustrated all the latest uses to which electricity can be put, while the whole place is ablaze with electric lights, giving the Aquarium the appearance of an Aladdin's cave. Among the principal novelties are an electric piano and a model electric tramway in full working order. All the most up-to-date electrical appliances are seen in actual operation, and the cooking is also done by electricity.

THE offices in connection with the municipal electric-lighting works and dust destructor at Hackney have been formally opened. The whole of the works are erected on five acres of land on the corner of the Millfields, with a frontage on Millfields Road, Clapton Park. The cost has been 44,741*l.*, this including 6,000*l.* for the offices now opened. There is yet to be added a mechanical coal-feeding apparatus.

which will hoist the coal from barges on the river Lea by electrical power and deliver it in the boiler-house. The total cost of the electric-lighting plant and apparatus, dust destructor and offices is 384,867. Although the electric-lighting works were only opened on October 31 of last year, already 118 miles of mains have been put down, while there are 670 consumers and some 700 applications for the power.

### TRADE NOTES.

MESSRS. JOHN OAKEY & SONS, LTD., will pay the dividend on Six per Cent. Preference shares for the six months ending October 31 on November 1.

MESSRS. ANDREW HANDYSIDE & CO., LTD, steel bridge, roof and structure makers, of Derby, have secured the contract for the extension of Messrs. Leys's Malleable Casting Works, Derby.

THE committee of the Sanitary Institute at the Health Exhibition (recently held in Manchester) have awarded to Messrs. Ewart & Son, Ltd., of 346-350 Euston Road, a medal for the combined efficiency and safety of their well-known "lightning" geyser.

OWING to their extensive premises in Drury Lane having been acquired by the London County Council for the purposes of the new street, Messrs. Hart, Son & Peard have removed to 138-140 Charing Cross Road, Oxford Street, where they are now fully prepared to receive their customers.

WE have received a price list of the various useful appliances of which Messrs. Heathman & Co., of Rectory Road, Parson's Green, S.W., and branches, are the manufacturers. These comprise fire-extinguishing apparatus, ladders, steps, barrows, window-cleaning appliances, &c., of which the dimensions and very moderate prices are fully given.

THE Rev. Jas. Harrison, M.A., vicar, churchwardens and inhabitants of Barbon, have given instructions to Messrs. W. Potts & Sons, clock manufacturers, Guildford Street, Leeds, to fix a new 8-day hour-striking clock in the tower of Barbon parish church from the plans of Lord Grimthorpe. The dial is from the designs of the architects, Messrs. Paley & Austen, Lancaster.

FOR the convenience of their customers in the north of London, Messrs. J. H. Sankey & Son, contractors to

H.M. Government, have opened a dépôt at the Midland Railway Goods Yard, Kentish Town (Gillies Street entrance), where they are stocking best Portland cement, grey lime, plaster, pipes, slates, sands, glazed bricks, blue bricks, fire bricks, sanitary specialties, &c., and all other goods in their line for which there is a demand. It is worthy of notice that from their various wharves and dépôts they are in a position to deliver anywhere in the metropolitan area by van. They point out that they can also deliver direct from the various works with which they are connected.

MESSRS. M. GLOVER & CO., saw-mill engineers of Leeds, had a very interesting exhibit at the recent great Yorkshire Agricultural Show, which received the constant attention of visitors. Representative appliances were exhibited illustrating their patent machinery for sawing, arranging, splitting, screening and bundling firewood, which are admittedly valuable in connection with the firewood industry, and the saving of labour, &c., should represent a high rate of profit for users. A portion of the exhibit consisted of a glass case containing valuable working models to scale. There were also exhibited some of Messrs. Glover's high-class saw-benches and several of their new patent "ideal" saw-guards. One of their well-known improved saw-sharpening machines and a machine for compressing and bundling up box and case boards was likewise shown. Users may be advised to ask the patentees for lists, &c., their address being M. Glover & Co, engineers, Holbeck Lane, Leeds.

A VERY satisfactory demonstration of the value of the May-Oatway fire alarm apparatus was given on Saturday afternoon last at Messrs. Hunter, Barr & Co.'s new premises in Queen Street, Glasgow. This efficient system, with which many of our readers are by this time familiar, and which consists of the expansion of an exposed wire or wires in the building by a sudden rise in temperature, which causes the action of a metallic connection to complete an electric circuit and ring a gong both in the building and at the Central Fire Station, was minutely examined by a large company and lucidly explained by Mr. G. H. Oatway, and at 3.17, in the presence of Bailie Cleland, the convener of the Fire Brigade committee; Firemaster Paterson, Central; and Firemaster Inkster, Aberdeen, and others, a quantity of wool waste, soaked in spirits of wine, was lit on the ground floor of the building. Twenty seconds from the moment of lighting the gong was ringing loudly, and the alarm thus efficiently given.

## VARIETIES.

THE Bishop of Stepney, on the 4th inst., consecrated St. Faith's Church, Shandy Street. The chancel, with two bay naves, was opened for divine service in November, 1891. The completed building has cost 5,000*l*.

ST. MARY'S, Eastry, near Dover, has been reopened after undergoing extensive restoration. This church was erected in 1285, and was the third built on the same site. A thousand years ago Eastry was the capital of the kings of Kent, and Thomas à Becket lay in hiding at Eastry Court on his celebrated journey to France in 1164.

THE opening of the Barry Road, Northampton, Board school took place on Friday afternoon. The school, which gives accommodation for 1,370 children—420 boys, 420 girls and 530 infants—has, with the swimming bath and the caretaker's house, cost 24,396*l*. The rooms are lofty and well-lighted, while the arrangements for heating and ventilation are of the best. The architects were Messrs. Law & Harris.

A NEW Primitive Methodist church in Lady Pit Lane, Leeds, was opened on Saturday. Formerly the congregation worshipped in a small iron structure on the same site. Now they have got a commodious building, with a school, that has cost some 3,657*l*. The chapel contains seating accommodation for 650, and the school, which is underneath, will accommodate from 400 to 500. The building is of brick and in a modified Classic style, well adapted to the situation by the architect, Mr. W. G. Smithson, of Leeds.

THE new parish hall in connection with St. Mary's Church, Liscard, was formally opened on the 25th ult. in the presence of a large gathering of parishioners. The spacious hall, which has been erected and furnished at a cost of 2,300*l*., stands at the east end of the church, facing the old Manor Lane. It consists of an assembly-room and gallery which together allow

accommodation for 550 persons. There are two large classrooms at the west end, each giving teaching accommodation for forty-two children. These rooms are arranged in connection with the platform and serve as retiring-rooms. There is also a kitchen which can be used as a classroom. There are two principal entrances at the west end, and two minor entrances which would serve as ample exits in case of need. The ground floors are laid with blocks and tiles. The large room is fitted with heating apparatus, and the whole building is lighted by electricity. The roof timbers of the hall are specially designed so that the room may be used as a gymnasium. The architect for the building was Mr. E. Nobbs, and the building contract was carried out by Mr. T. F. Cooke.

THE formal opening of the Ellerbeck infectious hospital at Workington, built by the Workington Corporation, took place on the 25th ult. The hospital, which was at one time a poorhouse, was acquired by the old Local Board in 1888 for a sum of 800*l*., and a further sum of 300*l*. was spent by the Board to make it fit for the purposes of an infectious hospital. After some years the accommodation was found to be inadequate, and the Corporation in 1897 borrowed a sum of 5,505*l*. from the Local Government Board to convert the building into a thoroughly up-to-date hospital. The old building was gutted, only the walls and roof being left, and the hospital is a two-storeyed structure. The ground-floor consists of two large wards, one of which is 33 feet by 34½ feet, and has six beds, while the other is 27 feet by 34½ feet, and has provision for four beds. On the upper floor there are two similar wards, one with six beds and the other with four, making the total number of beds twenty. On each floor there is a nurses' room, and there is a hand-lift for the purpose of removing patients to the upper floor. The building is ventilated on the most modern system, and is heated by hot water. The outbuildings comprise washhouse, drying-room, ironing-room, laundry-room, mortuary and a disinfecting-chamber fitted up with a steam disinfecter. The administration block is a separate building, and every convenience has there been furnished. A bacteria bed plant has been laid down for the disposal of the sewage on plans prepared by Mr. Jos. Graham, C.E., of Carlisle. It consists of a grit-chamber, a septic-tank and three filters or contact-beds. The plans of the building were prepared by Mr. W. L. Eaglesfield, the surveyor, and Mr. H. B. Williams, the assistant surveyor, under whose superintendence the work has been carried out.

**SAFE DEPOSITS.**

NOT the least interesting of the sights of town are the premises of the Chancery Lane Safe Deposit Company, which consist

of two vast subterranean storeys underneath the block of lofty stone buildings near the Holborn end of that gloomy region of law. In the very entrance there is something Miltonic in the look of the stalwart janitors,

Whose charge it is to keep  
This place inviolable;

and in wandering through the acre of space which the floors comprise we are impressed by the long rows of steel strong-rooms and steel safes. Here are stored away in safety countless documents of the greatest importance, and jewellery, precious stones, money, shares and other valuables, the worth of which must amount to a large sum. Chests, trunks and other secured packages may be deposited in common strong-holds under the control of the company for a few shillings a year. For safes the rent varies between one guinea and eight; for strong-rooms between five guineas and a hundred. The tenants have the only keys to them, the company having no duplicates, and they have access to them at all hours of the day. The building is entirely of iron and concrete, and it is patrolled by trustworthy men by day and night; it is therefore quite proof against thieves or fire. Pleasant and comfortable reading and writing-rooms, with a telephone, are provided for the accommodation of the tenants, and ladies have rooms reserved for them. The company have certainly satisfied a great want, as is proved by the constant increase in the number of their tenants.

**BUILDING AND BUILDERS.**

A NEW Independent Methodist chapel is to be erected at High Park Road, Southport, at a cost of 1,500*l*, and a site has been secured for 270*l*.

AT a meeting of the local Society for the Prevention of Consumption at Newcastle it was decided to build a sanatorium for consumptive patients in Northumberland and Newcastle. The proposed building is to accommodate 50 patients, and will cost 50,000*l*.

ANOTHER large theatre is about to be erected at the corner of St Martin's Lane and Chandos Street, and is to be called the Coliseum. The site consists of considerable freehold property, including three public-houses—the Chandos being the largest. A continuous entertainment is to be provided, starting at midday and lasting until midnight. Mr. Frank Matcham will be the architect.

THE Midland and Great Northern Railways joint committee have in contemplation a scheme which practically involves the rebuilding of the Beach station, Yarmouth. The plans will be carried out by degrees. The first step will be the construction of new platforms and offices, and a subway under Kitchener Road for foot traffic. The contract for the work has been given to Messrs Chapman & Sons, of Rupert Street, Norwich.

MEMORIAL-STONES have been laid of a new Wesleyan chapel and Sunday-school at Kenilworth. The chapel, which will be a handsome building in Late Gothic style, in red brick with stone dressings, will take the place of the old incommensurable structure which has long ceased to be adequate for the local needs of the Connexion. The total cost of the scheme, including land, is 2,300*l*.

CHELTEMHAM wore an unwonted air of gaiety on the 1st inst, the occasion being the laying of the foundation-stone of the new town hall which is being erected on ground adjoining the winter garden. The main entrance of the new building (with carriage porch outside) is on the north-east side of Imperial Square, and leads into the entrance hall (40 feet by 20 feet). At each end of this entrance hall is an octagonal inner hall, from which access is obtained to the ladies' cloak-rooms, &c., on the north-west side; this latter also contains a large staircase leading to the galleries above. From each of these inner halls a corridor 12 feet wide runs the whole length on either side of the main hall, and these corridors give access at several points to the main hall and to various other rooms which will be used in connection therewith. Thus opening out of the corridor on the south-east side of main hall are the drawing-rooms (57 feet by 27 feet and 26 feet by 16 feet 6 inches), card-room (26 feet by 16 feet 6 inches), and smoking-room (21 feet by 16 feet), and on the north-west side the supper-room (55 feet 6 inches by 55 feet 6 inches), refreshment-room (37 feet by 37 feet), with service-room (37 feet by 18 feet) adjoining, and kitchen, &c., beneath. The north-west corridor connects the new town hall with the winter garden. The main hall, which will be used for balls, concerts, &c., is 112 feet long, 52 feet wide and 43 feet high, with coved ceiling. Galleries are placed at one end over the entrance hall and along each side over the corridors, and open into the hall by a series of arched openings, these being reached by staircases at the opposite end of the building. At the other end of the main hall is the platform and orchestra, with organ chamber behind same, access to which is obtained by a

separate staircase. Large storage accommodation for various purposes is provided under the floor of the main hall. Great care has been bestowed upon the planning of the buildings to make the arrangements as simple and workable as possible and to provide ample approaches and exits. The structure is already far advanced, part being nearly roofed in. The design of the building was entrusted to Messrs. Waller & Son, architects, of Gloucester, and the estimated outlay is about 35,000*l*.

### INDUSTRIAL LOCOMOTIVES.

FOR the extended use of the locomotive much of the credit should be given to Messrs. Peckett & Sons, of Bristol. Recognising the fact that for passenger and goods traffic each railway company has its own special engines, they have produced types of engines which not only can supplement those on railways, but can be adopted for a multiplicity of operations, one of the most important being for contractors' haulage. An illustrated description of their works has appeared, and a glance at the plates is sufficient to suggest the system which prevails throughout the establishments. In similar works much is commonly left to chance, but at Bristol we see "shops" which are specially arranged for the operations which are performed in them, and it is apparent that the works and machinery have not assumed a holiday appearance or have been prepared for photographing. All the views seem to have been taken immediately after the men had ceased to work. The premises are very extensive, the "shops" alone covering an area of about five acres. All parts of the engines are made by the firm. The majority of the men employed were trained in the shops, and all co-operate as if they were parts of a colossal machine. As we mentioned at the time, Messrs. Peckett supplied the engines for the Chichester and Selsey Light Railway, which was the first of its kind in this country, and their engines are known for their utility in most parts of the world. There are many types of them. In one illustration we see a saddle-tank locomotive drawing trucks on the Metropolitan Railway; but the firm turn out locomotives which are adapted to such small gauges as 1 foot 9 inches; some are for a gauge of 3 feet and upwards. There is always in stock engines for the 4 feet 8½ inches gauge, but any gauge can be suited. An important quality is that the parts are standardised, and in consequence there is no delay in repairing a locomotive which

breaks down from any cause. The Atlas Works have been in existence for about forty years. In 1880 they were taken over by the late Mr. Thomas Peckett, and ten years afterwards the business came into possession of Messrs. G. T. Peckett, J. F. Peckett, T. Peckett and L. Peckett, each of whom looks after one or more departments. The views of the works and the history of the firm are a refutation of the pessimists who imagine that English engineers are not equal to the demands of the age.

### THE DEVELOPMENT OF ROLLED BEAMS.

THERE have been so many engineering triumphs during the nineteenth century and there are so many champions to uphold the supremacy of particular examples, it is not surprising that their relative value has not been established. But as regards statical construction nothing arose during the century to surpass the determination of the forms of beams and columns. Previous to 1820, when Tredgold by means of experiments on a small scale was able to ascertain the most efficient section of a cast-iron beam, the forms which were in use would now be considered as absurd. The limitation of the resistance to extension offered by cast-iron was, however, an obstacle to its general employment for beams. The elaborate and costly experiments of Eaton Hodgkinson and Fairbairn, which were confirmed by those ordered by Robert Stephenson to discover the most suitable form for a wrought-iron beam which would serve as a substitute for cast-iron, were crowned with success. It was established beyond doubt that with two horizontal flanges united by a web a beam was produced of which the strength could be calculated beforehand, and which was not liable to the uncertainties or accidents which diminished the confidence in the use of cast-iron. The flanges might take the form of a series of cells or chambers and the web might become a framing of struts and ties, but the principle of a great structure like the Britannia Bridge was identical with that of a small girder made up of angle-irons and plates and which could be utilised for a factory floor or for a bridge over a lane. From that apparently simple conclusion structures have become possible which have not only revolutionised the practice of bridge building, but have enabled civil engineering to accomplish its main purpose of facilitating communication between men.

The simplicity of the normal wrought-iron beam was an inducement to inventors to devise arrangements for its pro-

duction by rolling. If angles, tees and channels could be turned out in unlimited quantities, why should not a form which might be described as a double tee or a quadruple angle iron with a web be also feasible? Various sections of rails could be rolled, and why not I beams or joists? A strike of carpenters in Paris had extended the use of iron, and, moreover, English architects began to realise the advantage of having floors which resembled the French, and in which rolled iron was an element. The production of joists was therefore quickened, but for a long time the sections were limited in their dimensions. An increase of size was effected with difficulty. Twenty years ago the great Cockerill Company in Belgium rolled no larger sections than 12½ inches by 6¼ inches for iron, and 8½ inches by 4 inches for steel. The biggest steel joist which has been available up to the present measures 20 inches by 7½ inches, although the Americans have a 24 inches by 7½ inches. The difficulty is as much with the width of the flanges as with the depth. As a rule the flanges were supposed to measure one-half the length, and thus such proportions as 12 inches by 6 inches, 10 inches by 5 inches, 8 inches by 4 inches, 6 inches by 3 inches, have become familiar among builders. After a certain limit the proportion is diminished—16 by 6, 14 by 6 and 17½ by 6¼ are recognised market sections.

The inefficiency arising from the inadequacy of small-size sections was overcome. Plates have been added to increase the width of joists, and two or more have been rivetted together in order to obtain the desired height. At one time it was generally accepted that for all girders which exceed 12 inches in depth it was economical to construct them of plates and angle-irons, but in a great many cases there is not sufficient time for the building-up of beams. The old leisurely methods are not adapted to our time. A man who purchases a building site and expends money on building is eager to secure returns for his outlay as soon as possible, and any course by which time can be saved is gladly utilised. One of the reasons for the adoption of steel structures in America is the expedition with which the work advances. It is possible to have several storeys of offices occupied while the remainder of the building is in the hands of the contractors.

What we have said is of course familiar to our readers, but it will help to explain the satisfaction in which every growth in size of rolled joists is received. The whole history of the world, it has been stated, would have been altered if Cleopatra's nose had been an inch longer or shorter. The possibility of

being able to obtain a 24-inch instead of a 20-inch girder may have an important influence in fixing the character of a building. What, then, is to be said of an improvement in rolling mills by which 30-inch girders can be as easily procured as 7-inch joists were at one time? The advantages would be difficult to estimate on account of their vastness.

But increased length is only one of the improvements which architects and engineers have long desired in rolled joists. The new Differdange beams can also have no less a breadth than 12 inches, or nearly 5 inches in excess of what has been available. The old ratio no longer rules in them, for it is possible to obtain sections in which the height and width correspond. The following are some of the sections which can now be ordered:— $9\frac{1}{2}$  inches by  $9\frac{1}{2}$  inches, 10 inches by 10 inches,  $10\frac{1}{4}$  inches by  $10\frac{1}{4}$  inches,  $10\frac{3}{8}$  inches by  $10\frac{3}{8}$  inches, 11 inches by 11 inches,  $11\frac{1}{2}$  inches by  $11\frac{1}{2}$  inches, 12 inches by 12 inches. Then we can obtain a whole series of sections between  $12\frac{1}{2}$  inches and  $29\frac{1}{2}$  inches in height which have flanges with a width of 12 inches.

It is needless to point out the power of resistance which is derived from the increase in the width of the flanges. In calculating the strength of a girder we have to consider not only the area of material but the breadth and depth. In many cases the depth or height has to be reduced to a minimum, and the loss of advantages must be made up by greater width. For instance, a 16-inch by 6-inch joist is supposed to carry a safe load of 20 tons on a 20 feet span. But a 12-inch by 12-inch joist would perform the same work and allow a saving of 4 inches in the depth of a floor. Girders should be always sufficiently deep, but when space has to be measured in fractions of an inch compensation must be found in width. There are also numerous other cases where width is essential to steadiness. When steel joists are used for columns or stanchions the width of flanges aids stability to an extraordinary extent.

We have confined our remarks to qualities which must be self-evident when they are mentioned. Nothing has been said about the sections of the flanges in which a uniform taper of 9 per cent. has been adopted. In the majority of rolled joists the tapering is at least 14 per cent. Care has also been taken in forming the contour of the curves between the web and the flanges and in the curves of the flanges. In fact, the whole section shows a combination of lines which will make the Differdange beams easy of recognition. The steel generally employed is equal to a strain of from 24 to 29 tons

per square inch. But higher qualities of steel can be used by special agreement.

The Differdange beams have been introduced to the English market by Messrs. H. J. Skelton & Co., 71 Finsbury Pavement, E.C., who have prepared tables and diagrams which are convincing from their scientific accuracy. The beams themselves stand in no need of eulogy. They will meet necessities of construction which formerly required not only labour, but anxiety on the part of architects. To be able to secure a beam which on a span of 15 feet will sustain a distributed load of 102 tons with a working stress of only 5 tons a square inch is a gain which every architect can appreciate, especially when he remembers the beam can be purchased and delivered immediately, thus avoiding delays which often cause inconvenience to clients as well as to contractors.

### SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening October 6, Mr. Percy Griffith, president, in the chair, a paper was read on "The Hennebique System of Ferro-Concrete Construction," by Mr. Augustus de Rohan Galbraith.

The author commenced by observing that ferro-concrete construction appeared not to be very widely known in the profession. He then sketched the early history of the system, pointing out that the first authenticated adoption of the principle was by Napoleon the Great in the erection of fortifications near Strasburg in Alsace-Lorraine towards the close of the eighteenth century, and in which works hoop-iron bonding in concrete was employed.

He then referred to the various systems of ferro-concrete construction, stating that the originator of the principle was M. Joseph Monier, a Frenchman, and that it was first applied to the manufacture of slabs and pipes in ferro-cement. He then described the ferro-concrete system invented by M. Hennebique, a French engineer, which system has been widely introduced in practice in France, including the construction of a bridge of three arches at Chatellerault, 26 feet 3 inches wide, and having a centre span of 172 feet and two side spans of 135 feet each. This system is also being adopted in this country in various engineering works, notably in connection with the Old Quay widening and new dock works of the London and South-Western Railway Company at Southampton.

Excelsior and Rawdon Potteries,

The Hennebique principle consists in embedding in concrete straight and cranked iron or steel tension bars and stirrups, to take the shearing stresses, together with distance pieces, the system being applicable to, and employed in, entire buildings from foundation to roof, inclusive. The piles used at Southampton are built up in vertical moulds, in which are placed long steel rods, which give the required strength. These are laced together with wire stirrups, and Portland cement concrete of the best quality is filled into the moulds and rammed round the steel. After a month the pile is taken out of its mould and driven in position, much in the same way as timber piles are. The ram is exceptionally heavy, generally 30 cwt. The head of the pile is protected from injury by covering it with a helmet or iron case filled with sawdust; a timber dolly is always used.

The author then pointed out the care required in the selection and preparation of the materials, explaining that the usual proportions of the concrete were 5 to 1, and giving the preference of Siemens-Martin steel to Bessemer steel owing to the purer and more uniformly good quality of the former. He then dealt with the application of the system in general construction, giving the results of some tests of Hennebique beams with and without stirrups, which proved the superior strength of the former. He then stated that the results of experiments by Professors Baushinger and Ritter showed that the adherence of iron to concrete was about 570 lbs. per square inch. The coefficient of expansion and contraction of steel and concrete was found by M. Durand Claye to be identical up to the fifth decimal, giving the breaking strain of concrete as between 3,000 and 4,000 lbs. per square inch.

The advantages of the system as regards fire resistance were then illustrated by the light of some severe fire tests carried out at Ghent, together with the results of a fire which occurred at a spinning mill at St. Etienne, Belgium, which proved that ferro-concrete structures were perfectly fireproof.

The author then gave the following examples of the cost of the Hennebique system as carried out in different structures. The Chatellerault bridge 18*l.* 12*s.* per lineal foot; a grain warehouse at Plymouth 43*d.* per cube foot of space; a flour mill at Swansea 44*d.* per cube foot; grain silos at Swansea 64*d.* per cube foot, and some coal hoppers at Portsmouth 74*d.* per cube foot.

In conclusion the author referred to the development of the ferro-concrete system on the Continent, owing to which the French Government recently created a special department at

the Ministry of Public Works to take into consideration all matters relating to that principle of construction. He observed that although the system had not hitherto made very great headway in England, its advantages were becoming recognised and its adoption was increasing.

### METROPOLITAN IMPROVEMENTS.

In the course of the address delivered by the Chairman of the London County Council on the 7th inst., it was stated that the net cost of the four schemes which were proceeded with was estimated at 462,552*l.* Deducting from this amount the contributions to be received from the local authorities concerned, the estimated net cost to the Council became 355,348*l.*; adding to this the amount of 117,426*l.*, which during the year the Council agreed to contribute towards the cost of local improvements, the total net capital expenditure sanctioned by the Council during the year in respect of street improvements was 472,774*l.* The four improvements for which Parliamentary powers were being sought included the widening of Hampstead Road at the southern end, which would cost 225,500*l.*, of which the St. Pancras Borough Council would contribute one-eighth, and the widening of certain long lines of thoroughfare in Fulham, Deptford, Camberwell and Lambeth, in connection with proposals to construct tramways, the local authorities concerned contributing part of the cost of the street widenings. During the year one important improvement was completed, viz. the construction of Tower Bridge Road, which formed the principal southern approach to the Tower Bridge from Old Kent Road. Considerable progress had been made with the thirty-three schemes in course of execution. Of these the two most important were the new street from Holborn to the Strand and what was known as the "Westminster improvement scheme." In the case of the Holborn to the Strand improvement, where it was necessary to acquire property involving an expenditure approaching 5,000,000*l.* within a comparatively short period, Parliament had sanctioned the postponement for seven years of the beginning of the provision for the sinking fund in order to prevent an unduly heavy charge falling on the ratepayers during the seven years or so occupied in the carrying out of the improvement. After that period rents from surplus lands were expected to produce an income sufficient to pay practically the whole of the interest on the

capital outlay. The Council also endeavoured to obtain permission to charge interest in the first few years as part of the capital cost of the improvement, but the Lords Commissioners of His Majesty's Treasury, after taking all the circumstances into consideration, came to the conclusion that they would not be justified in supporting a provision of this nature if inserted in a Bill promoted by the Council. It was anticipated that the net cost of this scheme, after obtaining recoupment by disposal of the surplus land, would ultimately not exceed 774,000*l.*, but in the meantime, during the construction of the street, interest would have to be paid on probably four or five times that amount. The total gross expenditure of the Council in respect of the county improvements already sanctioned and now in hand, or about to be undertaken, was estimated at 11,127,344*l.*, and the net expenditure, after deducting recoupment, at 5,415,444*l.*

The parks committee devoted itself unceasingly to the question of providing additional open spaces for the county, a question becoming year by year more difficult as building operations progressed and open land became less in area and more costly in price. The total area of the parks and open spaces under the control of the Council was 3,832 acres, the total cost of acquisition, including the cost of permanent works, having been about 1,475,000*l.* For the money paid the Council had obtained a most valuable asset in the form of land used for the enjoyment of the people. The committee might be congratulated on the high state of efficiency at which it had maintained the county parks and playgrounds, and upon the arrangements made to secure for the public the use and enjoyment of the places to their utmost capacity, including the provision of music, accommodation for the various games, and facilities for the study of botany, for which the Council sanctioned in May 1898 the planting of beds in Battersea, Ravenscourt and Victoria parks.

During the year undertakings were entered into which would involve a total expenditure of about 65,000*l.* in respect of land and about 600,000*l.* in respect of buildings and other works. There had been considerable difficulty in past years in providing accommodation for persons of the working classes without incurring to a slight extent a charge upon the rates. The committee now found itself in the position, after paying interest and capital charges, of having a small balance remaining to the credit of the Council. This result had been achieved by the strict economy of its staff and by the fact of having a housing manager to watch the outgoings with the greatest care.

Good progress had been made with the development of the Totterdown Fields estate, Tooting, where cottages might be expected to be ready for letting in the late autumn. A new estate at Old Oak Common Lane, Hammersmith, had also been purchased. This estate was within the county, and its 50 acres would afford accommodation for some 9,200 persons. The Council had now about 348 acres of land acquired for "housing" purposes, at a cost of 217,000*l.*, and upon this land dwellings, chiefly cottages, for about 68,000 persons had been were being, or would be built at a cost of nearly 3,000,000*l.*

### BANGOUR ASYLUM WATER SUPPLY.

A SPECIAL meeting of the Edinburgh District Lunacy Board was held on Friday last for the purpose of considering the report of Messrs. W. A. Tait and George H. Hill, the engineers, on the Bangour Asylum water supply, and to receive the recommendation of the asylums committee on the matter. Mr. Richard Clark presided, and said that as they had the presence of Mr. Hill the asylums committee thought it would be a good opportunity for him to meet the whole Board. Questions having been invited, Captain Morrison said the sooner they proceeded with the Broxburn scheme the better, for they would then be able to get on with the work. They had wasted too much time already. Mr. Nisbet said he would like to know if there was not a possibility of getting the water from an artesian well. Mr. Williamson put a similar question, and in reply Mr. Hill said that his experience for obtaining water for a district was that where water could be obtained without pumping that was the proper course to follow. Pumping carried a perpetual charge, while in the other case in the course of thirty years the waterworks became their own property. He advised them to take the drainage area in preference to an artesian well. Mr. Welsh asked if they would require to purchase a drainage area close by, and the Chairman replied that it was unnecessary. Mr. Nisbet asked what means they would have for preventing pollution if they did not acquire the right of property in the drainage area, and the Chairman replied that they had had the opinion of Mr. Hill that it was not necessary to acquire the drainage area. He intended to make a motion on the recommendation of the committee.

The Clerk then read the recommendation of the committee, which was to the effect that the Chairman had moved and

Mr. Stalker seconded:—"That the committee, having heard Mr. Hill and Mr. Tait as to their report on the supply of water to the asylum, agree to recommend the board to adopt the scheme to supply 72,000 gallons per day from Broxburn, the initial cost of which is 16,000*l.*, and an annual cost of 900*l.*, embracing redemption and interest, and that the powers to acquire the drainage area to protect the purity of the supply being, in the opinion of the engineers, not absolutely necessary be not exercised, but that the board's powers under the Act for the purchase of a site for their works both at Linenfaulds and Broxburn, in view of possible extension, be exercised within the limit of time allowed by the Act."

The Chairman moved and Mr Stalker seconded the adoption of the recommendation. The Rev. John Baird, in supporting it, said he was very pleased at the issue of their deliberations. The committee had very carefully gone into the matter, and every possible point had been well considered. He thought they found themselves now in a very satisfactory position, and he was glad that the result of their various discussions had had the issue indicated in the motion. Mr James Thomson moved an addition to the motion, to the effect that the engineers be given power to construct cesspools or other sewage works, and have them cleaned out by the board so as to intercept pollution. The Chairman suggesting that the asylums committee would consider the matter, Mr Thomson's addition was not pressed. The Chairman said that two acres of ground had been acquired for their purpose. Mr. Welsh asked if 72,000 gallons a day would be ample for the institution, and the Chairman replied in the affirmative. The motion was unanimously agreed to, and the matter was remitted to the asylums committee to see it carried out. A vote of thanks to Mr. Hill concluded the meeting.

#### CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

At the Caxton Hall, Caxton Street, Westminster, on the 2nd inst., Mr. Ebenezer Howard, the author of the Garden City project, delivered an address before the members of the Civil and Mechanical Engineers' Society on "Some Engineering Features of the Garden City Scheme." Under the scheme it is proposed to lay out towns or settlements in concentric rings or belts, consisting of alternate blocks of buildings and open spaces arranged in circular formation, with an ornamental park in the centre. Discussing the engineering

aspect of such a project, Mr. Howard devoted much attention to the arrangements for water and sewage distribution. The whole city, he said, would be planned out before the engineer laid a pipe, and consequently his system of reticulation could be arranged with unexampled precision; while the sewage engineer would be, for once in his life, happy. Equally, from the electrical supply point of view, Garden City would present no difficulty. Its first use would be to supply energy and light for the construction of the town itself, because it would be necessary before the building of the town commenced to have a supply of power ready provided. If the city were to be built to-morrow steam-engines would be employed to generate the current, and the power-house would be outside the town; but a few years hence gas-engines would probably be requisitioned, with a power-house of handsome appearance in the centre of the city. Lighting in the streets would probably be by gas of poor quality with incandescent mantles, but in houses the electric light would be more popular. Traffic on the roads would be utterly different from that of an ordinary town, and the engineer would have it in his power to exercise a unique advantage by placing streets for rapid transit over or under the slow-traffic thoroughfares. The advantages to an industrial community when all the fundamentals of industry—light, heat and power "on tap" at practically wholesale charges—were provided were so obvious that the supply was sure to produce a demand, and he was sanguine that the Garden City was the city of the future.

#### SANITARY INSPECTORS' ASSOCIATION.

THE nineteenth annual general meeting of this Association was held on Saturday evening at the Holborn Restaurant. Mr. W. Wilkinson, the retiring chairman of the Council, presided during the first part of the proceedings, and moved the adoption of the report, which stated that marked progress had characterised the affairs of the Association during the past year, and it was believed that the position, status, responsibility and value of the sanitary inspector would soon receive that recognition from the public which had so long been merited. Reference was made to the appointment of a Royal Commission on Tuberculosis, and it was stated that many of the country inspectors could render incalculable service in connection with that subject. An offer had been received from the Chadwick Trustees of a gold medal and 50*l.* for presentation to that member of the Association whose

report to his authorities for the year was considered most worthy. A sub-committee had been appointed with a view to altering certain of the conditions in order to make it practicable for every member of the Association to compete for the gift. During the year ninety-three members had been elected, and a new branch had been opened at Belfast. Mr. Alexander seconded the motion, and the report was adopted. Mr. I. Young, the new chairman of the Council, afterwards took the chair, and was invested by the outgoing chairman with the badge of office. Mr. Young, after assuring the meeting that he would do all in his power to further the interests of the Association, read a letter which the Council proposed to address to the Sanitary Institute, calling attention to the case of the Borough of Southwark v. the Metropolitan Dwellings Company, Ltd., in which Dr. Wynter Blyth was reported to have stated in his evidence for the defendants that he was chairman of the Council of the Sanitary Institute, and that the water-test was an unreasonable test to apply to old drains, with the result that the magistrate dismissed the summons. The prominent position of the witness gave weight to his opinion. The decision was, in the opinion of the Council, most prejudicial to the public health, and the expressed opinion of the witness was so strongly opposed to the experience of members of the Sanitary Inspectors' Association, and to the teachings of the Sanitary Institute, that they respectfully asked the Council of the Sanitary Institute to take steps to dissociate the Institute from implied concurrence in Dr. Wynter Blyth's opinion. He said that sanitary inspectors must safeguard their interests, and when principles were taught which they knew from practical experience to be wrong they must combat them. It was resolved to send the letter, and to forward copies to the Local Government Board and the London County Council.

#### PREPARATION OF CONCRETE.

A BRIDGE with two arches, each 50 feet in span, has been constructed of concrete on the Peoria and Eastern Railway, U.S. The concrete for the arch and spandrel walls is a mixture of one part of Portland cement, two of sand and five of stone broken to pass a 1½-inch ring, while the mixture for piers, abutments and wing walls is one part cement, three of sand and six of stone broken to pass a 2-inch ring. The following directions for preparation of the concrete were given by the engineer:—

Hand-mixed concrete shall not be made in batches of more than 1 yard in each batch. The proper amount of the several kinds of material shall be measured in some way which is entirely satisfactory to the engineer or inspector in charge of the work, so that they may be satisfied that the requisite proportions of each kind of material are delivered for each batch of concrete. Satisfactory methods of measurement will be the use of headless or bottomless barrels for measuring sand and broken stone; the use of boxes into which the sand and stone may be cast and levelled off (the boxes then being removed) or the use of square and uniform-size wheelbarrows, expressly designed for the purpose. The measurement of sand and broken stone in the ordinary shallow, round-bottom wheelbarrow will not be considered satisfactory, and shall not be permitted.

The detail of mixing concrete by hand shall be generally as follows:—The proper amount of sand shall be measured and spread upon the concrete platform, and the proper amount of cement shall be delivered and spread upon the same; the sand and cement shall be turned over dry, either by means of shovels or hoes until they are evenly mixed. They shall then be wet and mixed into a rather thin mortar, and shall then again be spread into a uniform and thin layer upon the concrete platform. The proper amount of concrete stone (the same having been previously drenched with water) shall be spread upon the mortar, and the whole shall be turned over at least twice, either by shovels or hoes before it is loaded into the wheelbarrows, or in any other way taken to be placed in the work. In wetting the mixture of sand and cement to make the mortar, and in wetting the subsequent mixture of stone and sand and cement (if necessary), a spray or sprinkler shall be used. The water must not be dashed upon the mass in buckets or large quantities, or by means of a jet. The inspector shall insist that the resultant mixture of sand, cement and stone be as nearly as possible, uniform in character, the mortar being equally distributed through the mass of stone. The inspector shall also see that the mixture is neither too wet nor too dry. It should be of such a consistency that when thoroughly rammed it will quake slightly, but it should not be thin enough to quake in the barrow or before ramming.

Machine mixed concrete shall be made of the same general consistency as the hand mixed concrete above specified. Proper precautions shall be taken to see that the requisite proportions of the different ingredients are used. If machines are used which are not provided with devices to deliver each

tem, the process of making the concrete shall generally be as follows:—The proper amount of sand, cement and stone for a batch not to exceed 1 yard of concrete shall be delivered on the platform and roughly mixed together so that when the dry mass is cut down and delivered to the mixer by means of shovels, proper amounts of each of the ingredients are handled each shovelful. It will not be regarded as a satisfactory process to deliver crushed stone, sand and cement at random to the mixer, without taking some special means as above described to insure the delivery of the proper quantity of each ingredient as nearly as may be simultaneously.

Concrete facing shall be composed of 1 part Portland cement and 2½ parts sand, and shall have a thickness of at least 1 inch on all arch soffits, arch faces, abutments, piers, spandrels or other exposed surfaces. There must be no definite planes or surface of demarkation between the facing and concrete backing. The facing and backing must be deposited in the same layer, and be well rammed in place at the same time. No plastering will be allowed on the exposed faces of the work, but the inside faces of spandrel walls covered by the fill may be plastered with mortar having the same composition as specified for facing.

The concrete for arches shall be started simultaneously from both ends of the arch, and be built in longitudinal sections deep enough to constitute a day's work. The concrete shall be deposited in layers not more than 6 inches thick, each layer being well rammed in place before the previously deposited layer has had time to set partially. The work shall proceed day and night, if necessary, to complete each longitudinal section. These sections, while being built, shall be held in place by substantial timber forms, normal to the centreing and parallel to each other, and these forms shall be removed when the section has set sufficiently to admit of it. The sections shall be connected as specified above, and also, if in the opinion of the engineer it is deemed necessary, steel clamps or tie-rods shall be built into the concrete.

MINISTERIAL BUILDING IN AUSTRALIA.

ALTHOUGH the Minister for Works of New South Wales has from time to time given information to the public for the purpose of comparing favourably the day-labour system against the contract system, attempting to show how much has been saved here and how much has been gained there through

having works carried out by day-labour, says the *Building and Engineering Journal*, the Minister has not yet shown any inclination to point out how much has been lost in both time and money on any of the day-labour jobs which have far exceeded the cost for which they could have been done by contract. Perhaps one of the most glaring cases of the extravagance of the day-labour system, both in regard to waste of time and money, is furnished by the half-finished post and telegraph office at Newcastle, N.S.W., which has now been in hand so long, and which at the present rate of progress will take another two years to complete. Tenders were in the first instance called for this work by the State Government, being opened on September 11, 1899. The lowest tenderer was Mr. W. P. Graham at 17,711£, the next being Messrs. John C. Harrison & Son at 19,385£. Mr. Graham, evidently having quoted too low, withdrew from the job, and, being the second lowest tenderers, Messrs. Harrison & Son naturally expected that they would get the work, which they had undertaken to finish in eighteen months. Mr. Harrison interviewed the Minister for Works with a view to securing the contract, pointing out that there were numerous precedents upon which to grant his firm's request to be entrusted with the work, inasmuch as contracts had been let to the second lowest tenderers in previous cases. The Minister for Works, however, said it was impossible to give Messrs. Harrison & Son the work, owing to the fact that the departmental estimate was 16,000£ for the new building, which amount only had been voted by Parliament for it. The Minister decided to call for fresh tenders for the work, which were received in February 1900, and the result of this second tendering was that Messrs. Howie Bros were lowest at 19,229£. Messrs. Harrison & Son, no doubt in consequence of the way they had been treated in connection with the first tendering, refrained from sending in any offer at all. For some reason or other Messrs. Howie Bros. also withdrew from the contract, after which the Minister for Works proceeded to show how much the new post and telegraph office at Newcastle would cost if carried out by day-labour instead of by contract. As previously stated, the building is now only half finished, and has already cost over 20,000£, through being erected by day-labour, or 4,000£ more than the original departmental estimate for the whole work. According to the Federal estimates, the work will now cost 34,000£ odd to finish it, whereas it could have been completed months ago by Messrs. Harrison & Son, who were anxious to get the job in 1899, for

the sum of 19,385<sup>7</sup>. In the face of these facts, it is very difficult to accept Ministerial representations as to the existence of any advantages of the day-labour system over the contract system. In the case of the Newcastle post and telegraph office, it is quite plainly to be seen that the employment of day-labour means that the work is to cost the taxpayers nearly twice as much as it would have done if carried out by contract. Any contractor could have finished this job comfortably in eighteen months' time; so the facts show that not only is there to be a great waste of public money in connection with the work, but also of valuable time. There is another point in this matter which paints the case all the worse for the day-labour policy of the Government. We believe that freestone has been substituted in the staircases in the building in lieu of trachyte, provided for in the tendering in connection with the work. This would have considerably reduced the estimates of contractors who tendered for the job had they been asked to use freestone for the staircases instead of trachyte. Attempts appear to have been made recently to put the increased cost of this building on to the Federal Tariff. This, however, cannot be swallowed at all by people who understand anything about the matter. It is sheer nonsense to argue that the Federal Tariff had anything whatever to do with the excessive cost of the bricks used in the building, being made locally, and the freestone being supplied from Sydney. Whatever imported ironwork there is in the building must have been on the ground or in position before the Federal Tariff came in. Had the work been done by contract, all ironwork required would certainly have been purchased long before the Federal Tariff came into operation, and the Government also had any amount of time and opportunity to purchase the ironwork needed before the tariff came in.

### HOUSE DRAINAGE AND PLUMBING.

A PAPER on "House Drainage and Sanitary Plumbing from an Inspector's Point of View" was read by Mr. J. J. Elliott at the Sanitary Congress, Manchester.

House drainage and sanitary plumbing in recent years, he said, have become prominent and important factors in the science of sanitation, and as these two are inseparably connected with our present mode of living, and the health of the masses influenced by them, it is essential that those in authority should study to have these factors as perfect as possible, and also have absolute control of them.

The control of drainage and sanitary plumber's work is of the utmost importance, and nothing should be spared by way of legislation to enforce good and thorough work. The local authority should have absolute control of both and have competent inspectors to see that these works are properly executed.

Authorised lists of drainers, as kept by many towns, are far from being satisfactory, and in innumerable instances the drains inside premises are broken into for cleansing, are altered or reconstructed, without any responsible official being acquainted with the fact, the result being that the drains are probably left in a very imperfect condition, and what may previously have been a drain as defined by the Public Health Acts may have been converted into a sewer by the juncture of some branch drain from an adjoining premises belonging to the same owner, thus increasing the responsibility of the authority. It should be imperative that no drain or sewer be laid, reconstructed, opened or uncovered without the consent in writing of the authority or their representative, penalties being imposed for non-observance; the same should also apply to all sanitary plumber's work. All such works should be tested and passed by the authority's inspectors.

Medical officers and surveyors have a variety of work and cannot devote the time necessary to the effectual carrying out of this work. In towns it would be a distinct advantage to have a properly organised drainage department, with a thoroughly practical man at its head, who could devote all his time and energy to this class of work. The practical advantage of this, with regard to thoroughly good work and uniformity of system, cannot be overestimated.

The testing of such work is of the greatest importance. In general practice the testing of drains by hydraulic and other tests is well known. But after a satisfactory application of this test it is not to be inferred that they will remain watertight—a side pressure of earth against the pipes, a settling of the ground under the pipes, the careless filling of the trench or the vibration caused by machinery in motion, would each be sufficient to make the drain leak. This being so, all drains, wherever practicable, should be provided with easy means of access and be provided with a valve or other arrangement, so that at any time the drains may be stopped and tested with water.

The testing of drains and sanitary plumber's work should be repeated at stated times, say once in three years, preferably by an inspector acting under the direction of the sanitary authority. Records of such testing could be kept by the authority, and if certificates were granted to owners of property,

iving date of testing with general remarks, much good would undoubtedly accrue. The authority would also be kept informed as to the condition of all drains within its jurisdiction. This would also tend to lessen diseases which are attributable to soils saturated with organic matter and to defective drainage and plumber's work.

Attention was also drawn to the desirability and usefulness of automatic flushing-tanks in connection with drainage systems, and also to the necessity of having all the soil which has been excavated from trenches around and in the vicinity of defective drains thoroughly disinfected by freely sprinkling calcium chloride or some other equally effective agent.

A uniform system of drainage and sanitary plumber's work is a thing very much to be desired, and many advantages would accrue if such a system existed. It would be hailed with delight not only by property owners, but by contractors, manufacturers and inspectors alike.

The registration of plumbers is truly a step in the right direction and should be heartily supported, but registration will not debar a plumber from scamping his work.

The fittings and pipes in connection with a water-supply are tested and approved with a view to the saving of water, and if at any time these go wrong the most that is likely to occur is an inconvenience to the occupants, and the leak is easily detected; how much more essential it is that the more important branch of the plumber's art—sanitary plumbing, which affects the health of the community—be subjected to a thorough and systematic inspection.

To formulate a model specification for a uniform system would take up more time than that allowed for this paper, but as a step toward something tangible, it is suggested that a council of experts in drainage and plumber's work be organised, preferably by the Sanitary Institute or other similarly influential organisation, to devise a suitable system and to recommend the same to the consideration of the various corporations and councils with a view to its ultimate adoption.

christ, to the solution of the utilisation of its phosphoric ores, while we in this country were only beginning to think about it; it employed the invention of Martin, another Englishman, combined with that of a naturalised Englishman, Siemens, to the production of ingot iron, an article that is now rapidly superseding puddle iron, despite every statement to the contrary; it applied the invention of Watt and the discoveries of other Englishmen with regard to the thermal conditions for obtaining the best economy in steam-engines. All this has been done with the result given above, and is very materially presented to anyone who has visited the excellent exhibition at Düsseldorf. We have recently heard a good deal about financial crises in Germany. These have no doubt considerable foundation in fact. But let us ramble about the "Black" counties of Westphalia and Rhineland. Let us judge by what we see, and not by what we are told. The people are not ruined. Let us compare Düsseldorf with Birmingham, as being the respective metropolis of the "Black counties" of Germany and our own Midlands. Perhaps it is misleading to apply the term "Black county" to the German Midlands, because we do not see there the thousand and one chimneys belching forth black fumes and other noxious vapours with their concomitant waste. Modern automatic stokers are largely employed. The fuel is washed of a considerable amount of its sulphur compounds and ash before use. The dust and small coal is not thrown away, but compressed into briquettes. Fuel is, whenever possible, gasified and so burned.

We are in our own district (thanks to private enterprise) attempting to go one step further. That is to supply a purer product such as the Mond gas to the works. But how are we receiving this new fuel? Unless we are very much mistaken, by all kinds of obstructions. We visit the alleys of Düsseldorf, the equivalents of our back slums, and what do we see? None of the degrading poverty rampant in many parts of this district and no counterpart of the "Hooligan" or "Peaky Blinder." We walk through streets well paved and almost invariably lined with trees. We see no equivalent of the street loafer. Even the flower girls are respectably dressed, bright and cheerful. On the other hand, we see no signs of excessive luxury. The directors and proprietors of some of the large works do not depress one with an exhibition of extravagant wealth. We do not meet the drunkard at midday and we certainly do not see anything of those debased specimens of humanity—men and women—who promenade the streets at night. The men are strong and on the average stouter than

GERMANY'S "BLACK COUNTRY."

Now is it that the "Black country" of Germany has been made to make such great strides within the last two decades? As the *Birmingham Daily Post*. The answer given was, It applied the inventions of two Englishmen, Thomas and Gil-

TAYLOR'S PATENT JUNCTION "

No. 12662.

FOR WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

This junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the many angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are dangerous and not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be made to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this joint as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. In fixing this Joint, it is necessary to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back the Pipe 2 inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together and screw up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all is required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left in position. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property and causing other inconvenience.

- Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.
- Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.
- Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in. x 1 1/2 in. Invert Junction for Anti-syphon Pipes, &c.
- Shows how to arrange for a small sized branch.

Made in Three Strengths—Ordinary Rain Water,  $\frac{3}{8}$  and  $\frac{1}{4}$  Metal.

our men. The women are always clean, neatly dressed and cheerful. There appears to be more order in the affairs of life from the highest to the lowest member of society. If this be the result of a compulsory military system, then let us have a form of compulsory military system. If this be the result of a better organised educational system, then let us reform our educational system on parallel lines, and that at once.

The economic conditions existing in the "Black country" of Germany have rendered it imperative in the case of mining that their collieries should be equipped with large plants, because the mines vary from 500 to 1,000 yards deep. Every modern device for the transport of material is to be found in these large undertakings. There are no small collieries as we understand them. All the mines are on a scale equivalent to the Sandwell Park or Hamstead collieries, and even larger. Most of these collieries are equipped with coal-sorting and washing plants. Small coal and dust is collected and made into briquettes. By automatic devices and gravity the coal is carried into the coking ovens, in which most of the by-products are recovered. Some of these are converted into manures and others sent away for the production of aniline dyes, drugs, scents, &c.

Then, again, we were impressed by the number of overhead ropeways carrying ore, coal and coke from the mines, wharfs or collieries to the top of the blast furnaces, as it were, in a continuous stream. Electricity is largely called into requisition for actuating these various subsidiary operations. It is a common sight to see five miles or more of overhead ropeways carrying coke from the ovens at the collieries to a neighbouring blast furnace. As at the works, so at the collieries the miners can purchase their beer at a restaurant controlled by proprietors of the mine, and excellent changing-rooms, baths and wash-rooms are provided for the miners. We pass on to the steel-works, which we find, as a rule, fully equipped with all the modern appliances for the movement of material such as overhead travelling and jib cranes worked by electricity, and whenever it was possible to prevent brute force or brute labour on the part of the men mechanical appliances were at once installed. The workmen are regarded as directors of various processes carried out by machinery rather than beasts of burden. Ingot iron is one of the chief products of the district. Structural work of all kinds and dimensions is undertaken. Cranes of colossal proportions for lifting 1,000 tons are constructed of the ingot iron or mild steel. Bridges and girders of all kinds and shapes are made. In one works we visited we saw a crank shaft being

made for the electric-light station or tramway of the Corporation of Manchester. The exhibition of Düsseldorf is unique in its representative character, and remarkable for the artistic display of such articles as coke, sewage pipes, fire-bricks, rails, bolts and nuts, tubes, ropes and wire, and unparalleled in size and finish of its prime movers. Steam dynamos are at work developing thousands of horse-power and compound colliery winding-engines of colossal proportions working like clockwork. One of the largest gas-engines ever built is at work at the Exhibition, proving the possibilities of using waste blast-furnace gases for blowing purposes and for other necessary operations in the metallurgy of iron.

It is not invidious to compare the excellent electrical tram service in Düsseldorf with the monstrous steam tram rampant in Birmingham and the disconnected condition of the tramways. One can travel from one end of Düsseldorf to another by means of the former. Transfer tickets are in vogue which enable one to step from one system to another at certain crossings. For the equivalent of one penny one can travel nearly five miles in beautifully-appointed electrical tramcars through streets which eclipse in beauty the Hagley Road. These cars are provided with open trailers so that smokers may enjoy their cigars to and from business. The tramway service has practically superseded all vehicular traffic. In other words the requirements of the districts are made paramount, and not subservient to the wishes of a few individuals. The streets of Düsseldorf are laid out on a scale equal to that of Hagley Road, even larger. Down its main thoroughfares, the Hofgarten and Allee Strasse, tramcars run without defacing the beauties of these streets. No thoroughfare in Birmingham can be compared to them. The streets are beautifully lit with arc lamps and the general use of electricity by the ratepayers is shown in the number of houses wired for and using electric light. Düsseldorf is not only the centre of industrial enterprise, but also a city of artistic excellence. As far as we can judge, there is one spirit underlying the whole of the industry of the "Black country" of Germany. It is the spirit on the part of workmen and employers to excel in all they do, and determination to prove to the world that the individual units of the Fatherland are no longer content to take a second position in the commercial enterprises of the age. It would be well if a considerable amount of petty rivalry that exists in our district was sunk, in order that a higher ideal, with its concomitant advantages, shall take root and blossom in our course.

## THE WEEK.

IN the competition for the Municipal Buildings, Deptford, forty-five designs were submitted. Mr. J. BELCHER, A.R.A., the assessor appointed by the Council to adjudicate upon the designs, placed the following in their respective order of merit:—First, Design No. 3—Messrs. LANCHESTER, STEWART & RICKARDS, 1 Vernon Place, Bloomsbury Square, W.C. Second, Design No. 32—Messrs. S. B. RUSSELL & C. E. MALLOWS, 11 Gray's Inn Square, W.C. Third, Design No. 27—Mr. ARTHUR J. GALE, 4 Serjeants' Inn, Fleet Street, E.C. The Council think that the authors of the designs submitted would like to see the same, and have made arrangements for their exhibition at the Sayes Court Hall, Evelyn Street, Deptford, to-day (Friday) from 10 A.M. to 5 P.M. Sayes Court Hall is within the Sayes Court gardens and grounds.

ALTHOUGH there is a prejudice against cast-iron beams, which can, however, be utilised in many cases, yet casting in a broad sense still remains among the most important varieties of human industry. Great tensile strength is not always requisite, and an immense quantity of most useful articles as well as machines can be produced in which the tensile limits of the material need not be exceeded. The first part of a book on "Iron Foundry Practice," by Mr. G. R. BALE (the Technical Publishing Company, Ltd.), has appeared, and it gives information in its 400 pages about moulding and casting in a wide sense. It is one of the cheapest technical manuals which has lately been put on the market. The chemical aspects of cast-iron have not been hitherto sufficiently considered. The success of chill castings and malleable castings are suggestive of the improvements which can be attained. About the latter the author writes:—"The malleable cast-iron industry, although, comparatively speaking, still in its infancy, is undoubtedly of great importance. Never before has any metal known to the iron-casting industry attained the position already occupied in the commercial world by the malleable casting, while perhaps the most gratifying feature connected with its manufacture arises from the fact that wherever it has been introduced it has invariably developed, to the exclusion of other metals." It may be granted that some specimens of malleable casting are imperfect, but that arises mainly from defective knowledge of what is sought. Chemistry is particularly necessary in dealing with all the operations, and where reliance is placed on chance rather than science the products cannot be always satisfactory.

CONTRACTORS who employ steam-rollers or road locomotives are sometimes indifferent to the provisions of the Locomotive Act. A man, for instance, may not always be in front of the engine and steam is occasionally blown off in the road, although the Act prohibits both negligencies. A case which was heard a few days ago in the Portsmouth County Court suggests how easily accidents may arise from both causes. Three men were driving in a trap between Gosport and Fareham when they observed a traction-engine with trucks. The horse became frightened, but the driver, according to his own account, took care that he went steadily towards the locomotive. Just as the trap came near steam was blown off, the horse was alarmed and bolted, the trap toppled over throwing the occupants. The driver, who brought the action, said he was for several weeks under medical care and was unable to do any work. The engine-man stated it was impossible to let off steam as the engine was working at a pressure of 100, while the safety-valve was gauged to 120. He ascribed the accident to the plaintiff's taking his right hand off the reins in order to return a salute. The horse swerved and it was in the effort to restrain him the mishap occurred. A witness said he heard the plaintiff give a similar account of what occurred. Judgment was given for the defendant with costs. Fortunately the accident was not serious, and the result was not inequitable, but not much was required for the accident to have more serious consequences, and then the County Court judge could hardly fail to give a decision in favour of the plaintiff, or we might even suppose that in

the higher Court there would be not one, but three actions against the builder.

EUGÈNE FROMENTIN died in 1870, in his fiftieth year, and he is still without a memorial. A committee has been formed in Paris, with M. BOUGUEREAU as president, for the purpose of atoning for the neglect of thirty-two years. It is proposed to solicit 400*l.* from the municipal council of La Rochelle, the birthplace of the artist, and then to appeal to all Frenchmen for the remainder of the money which will be required. FROMENTIN was a remarkable man; he had gained some reputation as a landscapist when, like some other French painters, he was attracted to Algiers. But instead of a hurried visit he resolved to settle for some time in the country and live as an Arab. He wrote two books which were attractive, as they were the first to suggest the peculiar character of the desert as seen by a painter. Many books about Algeria have since been issued, but not one of them gives so deep an impression of North African life, and the two will be found delightful reading, especially by those who are confined in cities. FROMENTIN's paintings of Arab life bear the stamp of truth, although perhaps it might be said of them, paradoxical as it may seem, that they are not suggestive of the conventional notions of Arab life which have been founded on pictures that were not entirely completed in Africa. Some of his paintings are now in the Louvre.

ON July 18 last the Villa Borghese was to be sold by auction. The announcement was not credited in Rome, for so little restriction has been placed upon visitors, the people ultimately came to look on it as if it were one of their own possessions; in fact, they were less at home in some of the national buildings and public places. The villa was designed by GIOVANNI VANSANZIO, better known as "Il Fiammingo," but several of the princes enlarged and otherwise altered it. The museum was of universal renown, and it was purchased by NAPOLEON for 13,000,000 francs in order to enrich the Louvre. A great many of the works are still found at Paris, but those removed have been succeeded by others which were also remarkable. In recent times pains and penalties were incurred for sales of works of art by the Borghese family to foreigners, regardless of the terms of Cardinal PACCI's law. The mortgages and other claims on the property amount to 5,247,676 lire. It would be risky for any stranger to buy the villa, and the Italian Government, therefore, resolved to contribute 3,000,000 lire towards the payment of the debt, part of the sum being fines which had been imposed for breaches of the Pacci law. The King of ITALY has now arranged to supply the balance, and the villa will thus become the property of the city of Rome. In the grounds it is likely that a memorial of King HUMBERT will be erected.

AMONG the uses which honey subserved in antiquity was the preservation of dead bodies from decay. In Greece or Rome it does not appear to have been systematically employed for that purpose, and in consequence some doubts have been cast upon the practice. An inscription has been brought to light in Telmessos, in Pisidia, which was a part of the province of Pamphylia, and was the scene of a portion of FELLOW's explorations. The words of the tablet are:—"Here sleeps the sleep of eternity a man to whom the muses confided the gift of eloquence. BOETHOS lies in sweet honey." This is sufficient to confirm what was stated about the use of honey, or, it may be, of wax, as an aid in the process of embalming. It is presumed that the practice was more common among Babylonians and Persians than among Europeans. The kings of Sparta were distinguished by its use, and, in fact, the use of wax, it is believed, was restricted to princes and nobles. We cannot now realise what form was assumed by the honey or wax, but it is reasonable to conclude that the appearance of an encasement of wax would suggest waxen portraits which at one time were used not merely for public purposes, but as a means to preserve the portraits of people in their families. PLINY speaks of VARRO as rendering great service not only by the publication of the lives of about 700 personages, but by joining thereto their portraits. WINCKELMANN thinks he means portraits in plaster, but by others the passage is interpreted as referring to portraits in wax. Wax is still employed for portraiture.

PAINTERS' ARCHITECTURE: DOMENICHINO.

## CANADIAN ARCHÆOLOGY.

THERE was a time when archæology was generally restricted to remains which were suggestive of ancient life in Græce and Rome. By degrees the limits of the science were widened. The greater part of Europe was considered to be worthy of attention. The final stage was the recognition of the vast continent of America as a field of archæological research.

The problems which are offered there are manifold. At present a voyage across the Atlantic occupies a few days, but before steam navigation was perfected it was a tedious undertaking. As it was assumed that the cradle of the human race was in Asia, the first effort was to discover how the emigrants were able to reach so remote a region by means of boats which had to be impelled by oars. In endeavouring to answer the question, controversies have arisen not only between archæologists, ethnologists and historians, but geologists also, for they have interfered as if they alone were capable of solving the puzzle. In other words, the difficulty is so great, the easiest solution is to suppose that at one period there was continuity between east and west, if only by a narrow isthmus, which facilitated emigration. The possibility of an independent origin for the American race is so revolutionary of accepted beliefs that few of those who have taken a share in the contest have ventured to suggest it.

Often it has been said that one of the drawbacks of the United States is the absence of antiquity. Not even family ghosts are to be found in any of the new and popular cities. But the Government were wise enough to take measures for the demonstration of the existence of states, governments and civilised life on the Western Continent long before COLUMBUS made his daring voyage. The various ways in which archæological knowledge has been consequently extended are startling. The colossal architecture of parts of South America had been made familiar by the books of CATHERWOOD, STEPHENS and other travellers. There was, however, much else discovered afterwards which seemed strange to European builders. The cliff dwellings of Arizona and Colorado were unlike any examples with which European archæologists were acquainted. The globular adobe bricks were another novelty in building materials. The aboriginal communal dwellings suggested that some modern theories had been known and acted on long ago among tribes of Western Indians. Remains of buildings by the Maya show that they were competent to employ the ancient Mycænean method of forming arches by means of advancing courses or corbelling until they met at the summit. It was supposed that the utilising of earthenware drain-pipes for chimneys showed ingenuity, but the American Indians could improvise chimneys out of their earthenware cooking vessels. The great mounds known as the "Huacas" have sometimes an area of 10 acres, and were proofs that the effect of mass was no less appreciated across the Atlantic than in Egypt.

The success of the United States archæologists incited similar attempts in Canada. But it could not be expected in so poor a country to have the study of archæology carried out on as suitable a scale. There are no immense examples of masonry to convince the inhabitants of the existence of earlier and mysterious races who possessed skill in architecture. Wherever the inquirer turns in Canada, he finds nothing which is not in some way related to the Indian tribes with whom he is acquainted, or at least can have occasional glimpses of them. He does not admire or trust them. The former denizens of the country, however humble in the scale of civilisation, merit at least attention, and, moreover, as archæology is widely related, it would not be extraordinary if some of the evidence obtainable in Canada afforded aid towards the solution of prehistoric problems in Europe.

At any rate, England and Canada are in co-operation in conducting an ethnological survey. In this country the prime movers are a special committee of the British Association. The provincial governments, as well as the Dominion Government, have afforded aid, and it is hoped that in time the survey will be organised on a permanent basis, and that museums of local antiquities will be established throughout the country.

The last report is interesting, for it contains an account of the investigations of Mr. CHARLES HILL-TOUT among the Lower Frazer Indians. It is believed there are fourteen or fifteen separate tribes. They occupy the extreme west of Canada, in British Columbia, and are found on Vancouver Island. It might be imagined that as a result of that "moving on" which is like a command of destiny, they had been driven to the extreme limit of North America and had no course before them but to die or trust themselves to the ocean. These Salish tribes use dialects which are to some extent intelligible to Indians of the same race, however divided, with the exception of Halkomelem, men to whom Mr. HILL-TOUT's attention was mainly directed. They sometimes form very small village communities having from one to twelve adult males. They have no traditions of an ancestral home. They believe their ancestors always lived in the same region, looking on the same sky and the same mountains. The few traditions which have survived are not credible to the younger members, for, like polished Europeans, they are sceptical about whatever suggests the greater glory of former ages. A community seems to have been divided into chief, notables and common folk, slaves being also known. The chieftaincy was in most cases hereditary, although the chief could be deposed at the will of the people. He was a director rather than a ruler, and, in fact, the office was more sacerdotal than imperial. At the present time if a white minister or instructor should be absent the chief takes his place in church. To depose a chief was a rare act, and he was succeeded in his position by some member of his family. There was a war chief but no warrior class, and any fighting that arose was commonly caused by the invasion of hunting-grounds. Their per-

manent habitation was in a communal "long-house," a kind of dwelling which arose out of the desire for mutual safety and protection, and which was also common in parts of the States. The influence of the building has not been without its effect on the character of the people. The communism is concluded to be the result of the long-house, and the dances which serve instead of dramas are still performed in the buildings during winter days and evenings. Mr. HILL-TOUT gives the following description of one:—

The permanent habitation of the Tcil'qē'uk was the communal "long-house." The adoption of this style of dwelling, I learnt, was primarily for purposes of mutual protection and defence in cases of attack. It can readily be seen that such houses would be imperatively needful where the community was small, the number of males limited, and the tribe surrounded by hostile and predatory bands. Later, when this need was no longer felt, custom and a recognition of the social advantages of such a structure would operate to perpetuate this mode of building. I think there can be but little doubt that these dwellings, first erected for mutual safety and protection, have profoundly affected the social life and customs of the Indians using them. The communism of the Halkōmē'lem and coast Salish tribes doubtless grew out of it; likewise their character dances, which are invariably performed during the winter days and evenings in these long common houses. The long-house of the Tcil'qē'uk was of the half-gable or single-slope pattern, the front or higher side rising to 25 or 30 feet. The interior was equally divided between the different families of the tribe. Each family was entitled to a space eight talcs\* square. When the tribe was populous these houses would extend in an unbroken line for several hundred feet. The chief always occupied the centre. In this custom we have plain evidence of the truth of the statement made to me by the Indians, that they adopted this style of house primarily for protective purposes. The chief—the father and head of the tribe—whose loss would be most severely felt, is always lodged in the securest portion of the structure. On either side of him dwell his brothers, the elder ones coming first. After them come the lesser chiefs and notables, and beyond these again the common folk. There were commonly but two doors to these dwellings—one at each end. In the interior the spaces allotted to family use were separated by hanging mats or screens of grass or reeds. On festive occasions these were taken down and the divisions thrown into one. The beds were formed by reed mats laid one upon another, the head-rests or pillows being rolls of the same. The coverings of the meaner class were of the same material; the wealthier supplemented these by dressed skins and blankets made from the wool of the mountain goat. The "keekwilee," or underground winter-house, was also occasionally used by some of the Tcil'qē'uk, and known to them by the term *skem'el*. *Lā'lem* is the name by which the long-house was known, which, to judge by the *lam* of the Sk'qō'mic and other tribes, is the collective form of the term.

At the last meeting of the British Association Dr. HADDON made "Totemism" the subject of his presidential address in the anthropological section. Various definitions have been given of this word. Dr. HADDON followed Dr. FRAZER in believing that totemism, when fully developed, implies the division of a people into several totem kins, or totem clans, each of which has one, or frequently more than one, totem, "the totem being usually a species of animal, sometimes a species of plant, occasionally a natural object or phenomenon, rarely a manufactured object." Mr. HILL-TOUT explains the extent to which totemism prevails among the Indians who are the objects of his study. Like Dr. HADDON, he is of opinion that the totem was evolved from a fetish or talisman, for he says:—"That the peculiar clan totem of our northern tribes is the further evolution and natural extension of the personal totem becomes equally clear under the study of the origin and spread of personal and family crests and emblems; these standing in the same relation to the clan totem as the fetish does to the personal totem. These crests and emblems, formerly so highly esteemed and jealously guarded by those entitled to them, which entered so largely and affected so profoundly the social life and organisation of our coast Indians, are seen to have originated in two different ways. One springs from pictographic or plastic representation of the *su'lia*, as among the interior Salish and the northern Alaskan tribes; the other is an emblematic record of some event or adventure,

more or less mythical, in the life of the owner or his ancestors."

The *su'lia*, which represents a protecting influence, is not only found on weapons, utensils, clothes, but among the Halkomelem tribes it is painted or carved on the posts of the house and on the family corpse-box. It is to some extent a recognition of individuality in the midst of a communistic society. The subject is particularly interesting, for the efforts of the Indians are suggestive of the true foundation of heraldry as well as of the badges which have been of so much importance in uniting Scotsmen and in the mutual desire to assist one another which is known as clannishness.

Mr. HILL-TOUT has been occupied with the archæology of the territories of the Halkomelem tribes during the past ten years. He divides the remains into middens, burial-mounds or tumuli. One remarkable example is described by him which he met with on the north arm of the river Frazer. Since the midden mass was formed, a forest with trees from 4 to 8 feet in diameter has grown upon it. From sections of the trees it is evident that they are at least 500 years old. Nature has therefore taken possession of the place where prehistoric men had collected. The midden was composed of the decaying remains of marine shells with enormous quantities of ashes, calcined and fractured stones. The skulls found are unlike those of the modern Indians. No pottery was discovered, and Mr. HILL-TOUT concludes that the ceramic art appears to have been wholly unknown to the ancient as well as to the modern Indians of British Columbia. Instead of moulding and baking clay, they hollowed their bowls or basins from stone. They looked to nature for typical forms, and some of their utensils resemble animals and fish, the bear, frog and salmon being the favourite models. Occasionally, the bowl was shaped into a human head with a face on the exterior. As in Europe, they made spear and arrow points from bones, and axes, knives, chisels and scrapers from stone. Stone swords were a favourite weapon; some were like the short double-edged Roman sword, while others in cross section were similar to a belaying pin.

The middens are puzzling. Mr. HILL-TOUT holds that they must have been formed at least 1,000 years ago. But as the changes in the language spoken might be accomplished in half that time, he cannot believe that the middens could have belonged to ancestors of the Halkomelem tribes. The later middens are of a different character, and are thought to be old camp sites of existing tribes. The shells in them were so abundant and so well preserved, the early settlers were able to profitably convert them into lime. The relics are mainly in stone, and there is no such quantity of bone specimens as in the older middens. But the relic-hunters have been at work, and many interesting specimens are to be seen in the New York Museum.

The burial mounds have not yielded many relics. Separate interment was practised. From the presence of charcoal it is assumed that cremation was a custom especially in Vancouver Island, but whether the body was subjected to it or only the food, clothes and belongings of the deceased person remains uncertain. One class of sepulchral mounds were enclosed with boulders, and as they weighed from 25 to 200 lbs. each the total weight in some cases must have been from 25 to 30 tons. Sometimes the stones or boulders were piled in a conical form, as in Scottish cairns.

The most remarkable peculiarity in the tumuli is found in layers of sand that are at times disposed in a variety of colours, dark reddish or brown alternating with layers of clay and dark grey sand. In every case the sand appears to have been brought from a distance. What purpose the sand was intended to serve is not to be ascertained, and why it should be necessary to undergo the trouble of bringing it from a distance instead of using the sand in the neighbourhood will perhaps be always a mystery. A practice of this kind, which is entirely unknown even by tradition to the modern Indians of British Columbia, adds new interest to the difficulties of the subject. All that is evident is that in the district through which the Lower Frazer River runs in British Columbia there was once a people who had established customs about burials, as we can see from the character of their graves, but where they came from and how they vanished are questions to which no answer is

\* A *talcs* was the length of the interval or space between the outstretched arms of a man, measured across his chest from the tip of the middle finger on one hand to the corresponding point on the other.

forthcoming. There is no link by which they can be connected with the present Salish tribes that are among the KING's subjects, and who are supposed to be comparatively new arrivals, although they have no clue to the place of their origin. Future explorations may reveal evidence to enlighten us, but the rewards which such work offers in Canada, however interesting, cannot vie with those that are anticipated when digging in any part of Greece or of the Roman empire.

#### CHIMNEYS IN PARIS HOUSES.

THE sacrifice of a celebrity is sometimes necessary in order to have a reform introduced. It will not be the fault of some French journalists if the sudden death of the late EMILE ZOLA does not lead to an improvement in the chimneys of Paris. That one is needed is demonstrated by the remarkable variety of chimney-pots which can be observed in the city. There is so much to be admired on the line of sight in the streets of Paris, both natives and visitors avoid raising their eyes to the roofs. They are wise in controlling their vision. The spectacle of an assemblage of contorted tubes at variance with the fine masonry of the façade beneath as to appear like the work of another class of beings who are inimical to architectural effect, does not gratify the spectator. Parisians who possess the power of ignoring the forms which crown their homes are, however, sarcastic on those seen in foreign cities. THÉOPHILE GAUTIER, for whom the grotesque offered attractions, considered the chimney-pots to be the only things in Geneva which were suggestive of a little imagination among the people. He compared them to the English acrobats or acropedestrians, but with the stipulation that all of the profession in the world had collected in the most serious of capitals. With habitual honesty he admitted that Geneva was only a place of rehearsal for Paris. It was in the latter the "fumistes" were able to triumph.

The French stoves, or "calorifères," are as a rule of graceful form, and, it may be allowed, are never over-ornamented. The principles, as explained by inventors, are scientific, and on that account the honours obtained by the stoves from exhibitions are deserved. But no science or art can overcome the danger of the stuff which has to serve in many cases for fuel. A stove is supposed to "burn anything," and the tests of its efficiency are of the most diversified kinds. In that way the danger generally arises, instead of from the construction. But in the construction of chimneys there is also carelessness, and on that subject M. GEORGES BOURDON has been enabled to contribute to the *Figaro* the opinions of M. BOUVARD, the director of the architecture of the city of Paris, as well as of M. CATTI, who is, we suppose, a Piedmontese, like the majority of the chimney doctors of France, and who fills the office of "Président de la Chambre syndicale des entrepreneurs de fumisterie."

M. BOUVARD admits the prevalence of danger of which the death of EMILE ZOLA afforded sinister evidence, but he refuses to acknowledge that his department is in any way responsible for the consequences, however fatal, as their power can be called hardly nominal. It is true that in the by-laws and regulations of Paris much is said on the subject of chimneys. As recently as September 1901 an amended code was issued. The length of chimneys, the inclination of flues, the thickness of the material employed are three points on which there are formal regulations. But what effect have they? All the plans for new buildings have to be passed by M. BOUVARD's department. Care is taken to see that they correspond with the enactments. When the building is completed an "architecte-voyer" must undertake an examination. But he has to judge by what is visible, and has no authority to make openings in the walls in order to ascertain the character of the flues. Should complaints be raised by occupiers, then the "Commission des logements insalubres" will proceed to the place indicated, verify if possible the cause of the complaint and send a formal notice or summons to the proprietor. The latter can treat the document as waste-paper, for he knows that while in a case of urgency relating to defective construction the department of architecture can take down a balcony which threatens to become a danger to passers-by,

it possesses no actual powers to insure salubrity. The power begins and ends with the promotion of security. According to M. BOUVARD there is some hope that a remedy will shortly be found. A measure has been passed which has only to be put into working order in order to be exercised. The Commission of insalubrious lodgings can then do something more than remonstrate, for it will be empowered to inflict penalties for any transgression of the regulations. It is not to be supposed that carbonic acid or oxide of carbon will no longer be present in Parisian apartments, but tenants can have the satisfaction of knowing that municipal officers exist who can endeavour to pursue proprietors for neglecting to take measures against insanitary defects.

M. CATTI looks at causes and effects more closely. A chimney, he says, may be closed (*bouchée*) by an accumulation of soot, spiders' webs or birds' nests. It can be cleaned by the sweeps. It does not follow, however, that because the sweep's brush is forced along the flue at the beginning of every winter that a room is free from danger. There may be breaches in neighbouring flues through which the gas from one passes into the other and into the "appartement." Warm air charged with gases may find an entrance by many other ways. The arrangement of the flues may be imperfect. There was, it is stated, an elbow of which one side was almost horizontal in the room occupied by EMILE ZOLA, and that was one of the causes of his death. At the outlet a chimney may also be dominated by adjoining buildings, and the smoke cannot escape. M. CATTI also maintains that tapestries, hangings, cushions, &c., diminish the power of a chimney, and that a part of the gas is attracted within a room by them instead of travelling to the external air.

M. CATTI is in favour of wood as a fuel; for of all means of heating it is, he says, the healthiest and the least perilous. But the movable slow combustion stoves which the French demand he regards as menaces to life. The thin column of warm air which is emitted from them, and which should be accompanied by all the oxides and the carburets of hydrogen produced by combustion, is not always strong enough to struggle against the column of cold air which fills the flue, and must succumb to it. M. CATTI also believes a kind of verdigris is formed by the agency of French stoves, which not even pottery can resist. The tubes suffer in consequence, and irregular outlets for the escape of gases are thus provided. M. CATTI says he has had lately to reconstruct the chimneys of two adjoining houses which were deteriorated by that cause alone.

It is believed that EMILE ZOLA might have escaped death like his wife if he had not fallen while endeavouring to reach the window, and thus was enveloped in a stratum of air in which carbonic acid prevailed. M. CATTI was able to give particulars of another case which supported that theory. Two children of a professor of chemistry became seriously ill while the man and his wife remained in their customary state of health. The physicians were powerless. The chemist, who may have heard of Dr. CARNELLY's experiments, resolved to test the air derived from the room at the level at which it was inhaled by his wife and himself and at the level in which the children breathed. It was proved that while the latter was infected, the former was comparatively pure. The perilous stuff which came from the stove, being of greater specific gravity than ordinary air, could not rise, and was the poison through which the children suffered.

The modern builder's work in France does not satisfy M. CATTI. He described the houses as "châteaux de carton," mere structures of cards. Beautiful mansions are sought, but people will not pay the price required for good work. Everything has to be of the cheapest. The architects reduce the estimates of the contractors, the proprietors cut down the estimates of the architects. Then what happens? Inferior materials are utilised, and the workmanship is indifferent. For flues earthenware pipes are employed of the requisite thickness, but the jointing is neglected. The French architects no more meet with the approval of M. CATTI than the French stoves. They have, he asserts, the strangest theories about air. A hole is made in a façade, a grille is inserted in it, and the architect believes he has secured ventilation, but there is no conduit behind and the hole is valueless. M. CATTI mentions

that a few days before he had to demolish a chimney which did not work, and he was surprised to find that the flue after a certain height was confounded with another in a neighbouring house. The arrangement was prohibited by the municipal regulations, but the architect said it was perfection. There was death in each of the rooms with which the flues were connected, and, of course, the chairman of the fumistes has drawn a conclusion about the responsibility for them. On hearing the story M. GEORGES BOURDON recalls the legend, which is as popular in France as in England, of the architect who did not provide for chimneys until after the fireplaces had been constructed. M. BOURDON suggests that the architect in question was wiser than his modern successors in Paris. But how is the blame to be divided in such cases as EMILE ZOLA'S, where the stove in the appartement was as ineffective as the chimney?

### THE ROMAN FORT AT GELLYGAER.

THE following report of the exploration of the Roman Fort at Gellygaer has been prepared by Mr. John Ward, F.S.A., of the Cardiff Naturalists' Society:—

The village of Gellygaer lies between the Rhymney and the Bargoed Taff valleys, near the north-east border of Glamorgan, and at a distance of thirteen and a half miles N.N.W. of Cardiff. It occupies a high position (780 feet above the sea), and commands an extensive sweep of characteristic coal-measure country, for this village is in the heart of the eastern part of the South Wales coal-field.

The site of the fort is in a field to the north-west of the church, which has time beyond memory borne the name of Gaer Fawr (great camp). Here a number of low mounds bore witness to the significance of the name, for to an experienced eye they marked the outline and chief buildings of a typical Roman fort. The position is not naturally strong, yet it is well chosen. It occupies a commanding position on the brow of Nant Cylla, but is overlooked by rising ground on the north-west.

The exploration, for which permission was given by the owner of the property, Mr. Capel Hanbury Leigh, J.P., began in October 1899, and was continued during the warmer months each year until the end of autumn, 1901. During its progress the whole of the site was sufficiently excavated to admit of a survey being made of all the buildings, some of the more important being wholly uncovered. It shares with Housesteads on the Roman wall in Northumberland the distinction of being the most completely explored Roman fort in this country.

The survey of the remains, made by Mr. J. W. Rodger, of Cardiff, presents a typical Roman fort, singularly complete and characterised by great simplicity. The outer line of defence, it will be observed, is the usual ditch, which, in the case of Gellygaer, was crossed at the gates by bridges; the inner, an earthen rampart, faced on both sides by retaining walls. This rampart is pierced by four gates, one about the middle of each side. Besides the chambers which flank these gates there are twelve others, probably the basements of towers, at approximately equal distances along the rampart, one being at each corner. Connecting the lateral gates is the wide transverse street, the Via Principalis, and midway on its south-west side is the forum-like structure invariably found in these forts and usually denominated the Prætorium. This structure, as usual, breaks the continuity of the longitudinal street. The rest of the site is occupied by buildings of several types, corresponding in the main with those of other forts.

The length reckoned from the external face of the rampart is 404 feet and breadth 385 feet, so that this fort is one of the smallest of the British excavated series, and it is a shorter oblong than usual. Another peculiarity is the backward position of the Via Principalis.

The various buildings, including the rampart revêtements, were found to rarely remain to a greater height than 3 feet above the Roman level. They were constructed of the local Pennant grit-stone, a hard, thinly bedded rock, which is still the chief building material of the district. The masonry may be described as regularly coursed rubblework, but it varied considerably in quality. The gates, for instance, were neatly constructed of well-selected stones, many of which were more or less dressed. Some of the walls of the buildings of the interior, on the other hand—probably sleeper-walls to support superstructures of timber—were built of rough stones as quarried, with an admixture of weathered field stones. The voussoirs of the gate arches were of calcareous tufa.

Mortar had been used in all these walls, but it was found, as a rule, to have decomposed into sandy loam of the same colour as the surrounding soil. This proneness to decomposition was apparently due to the use of "white" lime, *i.e.*

lime derived from carboniferous limestone, and the inability of getting a suitable sand in the district. This limestone, together with the calcareous tufa just referred to, is found in the vicinity of Castle Morlais, ten miles to the north-west.

The foundations of all the outside and of most of the divisional walls were deep and well laid, consisting of rough quarried and field stones, roughly coursed in the case of the more important walls, and packed on end in the case of the less important.

The roofs of several of the more important buildings had been covered with red tiles of the usual Roman type; but from the absence of roofing tiles of any sort on the sites of others, particularly the "long" buildings, it may be inferred that these buildings had been thatched or covered with wooden shingles or planks.

The ditch was found to be of a shallow V-shape in section, approximately 19 feet in width from lip to lip and 7 feet in depth; and owing to the tenacious character of the natural soil the sides were singularly well preserved. The excavation in front of the south-west gate showed that each side of the ditch had been cut back so as to leave a step about 2 feet from the bottom, obviously to serve as a platform for the supports of a bridge, and from the absence of masonry it may be concluded that the bridge was of wood.

As already stated, the rampart was of earth (evidently derived from the ditch) and confined between two walls. The outer of these walls varied from 3 feet to 4 feet 3 inches in thickness, and the inner was considerably thinner. Both walls had been built against the earth bank. The total width of the rampart varied from 19 feet 4 inches to a trifle over 20 feet.

All the gates, so far as could be judged from their remains, were of similar design and size. They were double, that is, each contained two passages, 11 feet long and wide, separated by an intervening spina. Front and back these passages were narrowed to portals 9 feet 6 inches wide by projecting jambs or pilasters, which doubtless had carried arches, as the fragments of voussoirs of calcareous tufa were plentifully found on the sites. On either side of the pair of passages was an oblong guard-chamber about 11 feet by 9 feet 6 inches (internal measurements), entered by a narrow doorway in the back.

The whole structure (passages and guard-chambers) was within the width of the rampart, and the front pair of portals was set back nearly 6 feet behind the front line of the rampart. These portals had been provided with two-leaved doors, which turned on pivots. These in closing stopped against a rim or sill of stone which crossed the threshold, and in opening fell back into the recesses made by the projection of the pilasters. In one of the passages of the south-west gate the raised sill, pivot holes and bolt holes were found intact, the former consisting of two flagstones end to end, and set on edge in the ground, the upper edge being worn by traffic.

From the presence of red roofing tiles on the site of the north-east gate it is probable that the gates were roofed with these tiles.

The building (VII) designated by some the Prætorium and by others the Forum was the most central and probably the most important feature of the interior of the fort. It was oblong in plan, 80 feet by 68 feet, and was of simple type, consisting of (a) an interior courtyard entered from the Via Principalis, and surrounded on three sides by a narrow-roofed ambulatory, and (b) a posterior portion consisting of a space which may be regarded as the enlarged ambulatory of the fourth or far side of the courtyard with a range of five rooms opening into it. The middle room was distinguished from the rest by its external projection, in this respect resembling the corresponding room in some of the German prætoria.

On the north-west side of the Prætorium was a house-like structure (VI), consisting of a series of rooms which opened into a corridor surrounding a small central court, entered from the Via Principalis.

On the opposite side was an enclosed yard, which also had its chief entrance from the above street. This yard was not fully explored, but the trenches sufficiently showed that it was used for various purposes.

Between these and the lateral gates were two remarkable buttressed buildings (V. and VIII.), each about 83 by 35 feet. Remains of similar buildings have been found in most Roman forts, but nowhere else have they supplied so many hints as to their original construction and arrangement. Each of the Gellygaer examples consisted of a middle portion having a raised floor of wood or other perishable material, supported upon a number of parallel sleeper walls. In these walls and between the buttresses of the external walls were openings, evidently to allow of the free circulation of air between this raised floor and the ground. The roof above had been tiled in the usual way. At each end were the remains of a sort of portico, containing an entrance into the middle portion, reached by several steps. Of the various conjectures as to the use of these buildings the most feasible is that they were store-houses.

The four buildings described above formed a range along

the south-west side of the great cross street, the rest of the interior being occupied by a number of narrow transverse buildings, which apparently had been thatched, for no roofing tiles of any sort were found on their sites.

Six of these (I., II., XII., XIII., XIV., XV.) were alike, L-shaped, and their average length was 145 feet and width 36 feet. For about two-thirds of their length (corresponding to the upright limb of the L), however, the actual wall on one side was recessed or set back about 6 feet, the full width being maintained along this portion by a row of nine posts, which evidently supported the overhanging roof, forming a verandah. Buildings of a similar shape, but with stone pillars instead of wooden posts, have been found at Chesters (Cilurnum), in Northumberland. As these were divided into a number of narrow apartments opening on to the verandah, it is probable that the Gellygaer examples were similarly divided, only by wooden instead of stone partitions. These buildings were probably used for barracks.

The other long buildings differed from one another in shape and size, and it is likely enough that they were used for different purposes.

A complete memoir of the exploration, with plans, &c., drawn up by Mr. John Ward, F.S.A., for the Cardiff Naturalists' Society, is now in the press. Application for copies should be made to the hon. secretary of the Society, Dr. William Sheen, Cardiff.

### A SUSSEX MANOR.

NOT everybody in Sussex knows "the manor of Streatham," though most people are familiar with Henfield. A few days ago, says the *Sussex Daily News*, Mr. W. B. B. Freeland of Chichester, held at Henfield a court baron of the Ecclesiastical Commissioners, as deputy steward, and showed that, with his customary thoroughness, he had been at great pains to find out all he could about the manor of Streatham. It seems that when he took over the stewardship of the manor he was unable to find anyone who could tell him the bounds of the manor or the customs, or why the manor was apparently in two detached portions, but it occurred to him to search the cathedral register and library, and he there found first of all a survey of the manor made in 1647 by direction of the Long Parliament, who conceived the idea that it would be a right thing to annex the whole of the property of the archbishops and bishops throughout England, and as a preliminary to that step they had surveys made of the manor and sent commissioners down to Henfield; and thus the Long Parliament had preserved for them what they otherwise would not have had, and that was an accurate survey of the manor, describing the whole of the bounds, the copyholders and freeholders, and setting forth the customs and everything connected with the manor.

This still, however, left open the question how the manor was apparently severed into two parts, and it occurred to Mr. Freeland to consult the Domesday Book, and there he found the solution of the question, for on looking to the excellent map attached to the Domesday Book, he found that the cultivated lands in Sussex ceased on a line drawn east and west through Morley Farm, in Shermanbury, called Morleia in the Domesday Book, and that the whole of the land to the north was uncultivated, and comprised the great forest of Anderida, as it was then called. He further found on the Court Rolls of the Manor, and on the survey, evidence that the Bishop, as Lord of the Manor, had a chase in this forest, which extended far to the north, nearly to Crawley, and he had no doubt that all the manors adjacent to this forest also had their sporting rights over the forest generally, and in time, no doubt, verderers and foresters began to reside in various parts of the forest, and so little communities were formed and at last, at Cowfold, a church was built and endowed by the Bishop, and this was the origin of Cowfold. Mr. Freeland further ascertained that the original name of the manor, as it appeared in the Domesday Book, was undoubtedly Hamfelde, but that no doubt it took the name of Streatham from the fact that the Bishop had a country house at Streatham, which has now dwindled to a cottage residence or residences, and that he held his courts there, and so the manor came in time to be called the Manor of Streatham, from the place in which the courts were held.

A similar case had occurred in the Bishop's manor of Westringes, which has been modernised into Wittering. The manor of Wittering is not known by the name of the parish but by that of Cackham, from the Bishop's house, which he built there and which was one of his residences. Cackham Tower is still a prominent landmark, and one of the most beautiful views in Sussex is to be observed from its summit. The Bishop held his court there, and they are held there to this day. Hence the Wittering Manor is now called the manor of Cackham. As regards the neighbouring manor of Shermanbury, this, it appeared, was with other manors given to William de Braiose, said to be modernised into a name "Bruce," who

had his principal residence at Bramber Castle. What became of William de Braiose or his successor he (Mr. Freeland) had been unable to trace, except that his successor in title had quarrelled with King John and "rebelled" against him, after which he seems to have disappeared, and the manor of Shermanbury passed from hand to hand till it came into the possession of the family of the Rev. H. W. Hunt, from whose papers he (Mr. Freeland) had derived some of his information.

It was a peculiarity of this manor that several smaller manors such as the manors of Wantley, Moustow, Oreham and Wall Court were comprised within the bounds of the manor. But these were small holdings, not having any territorial jurisdiction with the exception of the manor of Wall Court, as to which there is a great peculiarity that it had twelve freehold tenants and no copyholders. As the copyholders were aware, the bishop originally held a court leet here for the Hundred of Tipnoak, in which the parishes of Henfield, Woodmancote, part of Shermanbury and Albourne were situated. No one could explain to him the origin of the name Tipnoak, but certainly in the Domesday Book it was called the Hundred of Hamfelde, and so it ought to be called to this day. Mr. Freeland had thus traced the history of the manor with which the Bishop had first of all been endowed by the Saxons. William the Conqueror had left the Church in possession of her property, and consequently the bishops of Chichester had both ecclesiastically and civilly been the lords of the manor from the very earliest times down to recent years, when, in or about the year 1870, the Ecclesiastical Commissioners, of whom the Bishop was one, were allowed to sweep the manor along with the other property of the Bishop into their net. That was the reason why they were assembled under the lordship of the Ecclesiastical Commissioners.

### HADDINGTON PARISH CHURCH.

A MEETING of heritors has been held at Haddington, when a report to the First Commissioner of Works, dated April 11, 1902, signed by Sir Herbert Maxwell, Bart., Sir John Stirling Maxwell, Bart., and Mr. R. Rowand Anderson, LL.D., and sent by the Board of Works in response to an application for the same by the heritors, was submitted re the proposed restoration of Haddington parish church:—

"Sir,—In accordance with your instructions, we have visited the parish church of St. Mary's, Haddington, bearing in mind the proposal submitted to you for obtaining the additional accommodation required for the congregation by restoring and reroofing the transept and treating it as an enlargement of the present church, which occupies the nave. We have carefully read and weighed the correspondence on the subject, both that between yourself and various individuals and that which has appeared on the subject in the public prints. We have also noted the statements set forth in the petition addressed to you by the ministers, kirk session and congregation and of other persons resident in the parish of Haddington, and, having given due consideration to the objections per contra against restoration of ancient buildings in general and of Haddington parish church in particular, we desire to submit the following report. In the first place, we would observe that although the building under consideration is commonly spoken of as Haddington Abbey or the 'Lamp of Lothian,' it is as certain as anything historic can be that the abbey and its church stood upon another site and have entirely disappeared. What we have to deal with is a building of the fifteenth century, which has been used in whole or in part as the parish church continuously from its erection, or at all events since the Reformation until the present day. We consider that this fact considerably modifies the objections entertained against the restoration of buildings which have become ruinous and ceased to be used for the purpose originally intended. Although choir and transept have been disused and become ruinous, the nave has never ceased to fulfil the requirements of the parish church. Mr. Eustace Balfour, whose opinion is entitled to respect, both on account of his professional standing and because he is a native of the county, condemns the proposed enlargement of the parish church as 'trespassing on the ruined portion of the abbey,' and recommends that the money offered by Mr. Christie should be applied to 'the erection of a new supplementary church in another part of the parish.' Such a scheme appears to us very inexpedient. In the first place, it is not at all probable that Mr. Christie would consent to spend his money on such a purpose. At all events, what is before us is his offer to find funds for the restoration of such parts of the church of St. Mary as may give the additional room required for the congregation. In the second place, it is probable that the parishioners, most of whom seem to have signed the petition to yourself, would regret the rupture of ancient association with the church of St. Mary. Lastly, when a parish church has ceased to afford the accommodation required, it is surely most natural and practical to restore it to some part, at least,

of its original dimensions, especially when this can be done without destroying any features of the original structure, for we cannot agree in Mr. Eustace Balfour's opinion that it is impossible to treat the transept as proposed 'without serious injury to its artistic or antiquarian value.' We recommend, therefore, that Mr. Christie's offer be accepted, and that the restoration of the transept be sanctioned according to the plans prepared by Messrs. Hay & Henderson, architects, Edinburgh, subject to the following modifications which we venture to suggest:—The finish proposed by Messrs. Hay & Henderson for the tower is unsatisfactory. There is on the centre of each face of the tower evidence of an intention to complete the central tower with an open crown like St. Giles's, Edinburgh, or King's College Chapel, Aberdeen, but there is no evidence that it was ever carried out. As far as one can make out from the present structure the idea was abandoned. We think the architects should be asked to reconsider the finish they show, and to try the effect of a pyramidal slated roof rising from behind a parapet, or a saddle-back structure, also rising from behind the parapet, as may be seen at the Dundee Church tower, Iona Cathedral, Crichton Church, &c. The former would put less weight on the piers of tower. We would also advise that the open parapets introduced in the early part of the nineteenth century be not reproduced, but that they be kept quite plain, as there is every reason to believe the original ones were, judging from the remains still to be seen, and from examples at other buildings. The tower has gone over to the north-east, but not to an extent to indicate any danger. The base of the north-east pier is crushed, and as the reinstatement of the vaulting will put a small extra weight on the piers, it would be desirable that the architects should carefully examine the foundations and underpin or enclose them with cement concrete as they may deem necessary. We venture to add that we consider it important that a decision should be arrived at and announced promptly, seeing that, as Mr. Christie is an aged gentleman, his handsome and generous offer may not remain long open for acceptance."

The Clerk (Mr. Stirling) read a letter from the law agents of the late Mr. Christie, intimating that it would be about the middle of October before they could state whether Mr. Christie's offer was still open or not.

### YORK MINSTER.

INFORMATION has been given of the progress which has been made in the restoration of the north-west tower at York Minster under the direction of Mr. G. F. Bodley, R.A. The third stage of the work, which is now completed, has been the most expensive owing to a series of elaborate buttress gables, niche-heads and pinnacles. Up to August the carvers had executed 2,058 crockets, 118 birds, 62 grotesques, 61 finials, 87 gargoyles and a number of bosses. No less than 6,608 cubic feet of stone have been used.

The Dean of York (Dr. A. P. Purey-Cust) has issued a report on the work, in the course of which he says:—When the whole of the existing scaffolding is removed the result, I am sure, will be to give encouragement to continue the work on the corresponding tower as soon as possible. The funds entrusted to us are, of course, still available, though the amount is gradually diminishing under the constant and large demands for workmen's wages and for material. We have reason, I think, to feel well satisfied that the large sum of 21,182*l.* 12*s.* 6*d.* should have been collected for the purpose during the heavy demands made on many persons for the South African war, and we cannot but be touched by the munificent bequest of the late Miss Florence Caroline Duncombe. We hope, however, that our many kind friends and well-wishers will continue their liberality until the great work is thoroughly completed.

Indeed the demands upon us seem to be increasing rather than diminishing, and other portions of the building to be requiring immediate attention as well as the west front. We have had to take prompt action with one of the windows in the south nave aisle, the old stonework of which was so rapidly giving way that it has had at once to be removed and replaced with new stonework. And now the condition of the beautiful stained glass in the chapter-house is demanding serious and speedy attention. The surface of the glass seems to have become smitten with little spots or scabs, which gradually spread until the face is entirely consumed and the substance of the plate reduced to the thickness of silver paper. Unless some protection is devised these windows will be speedily blown in and some of the most valuable portions of our art treasures blemished or destroyed. No doubt the expense will be great, and we cannot but hope that not only the general public but those also who have acquired their knowledge as glass painters from studying these windows will help us in this additional call upon our resources, and subscriptions are invited to a special fund for that purpose.

The whole of the glass is crumbling into dust, daylight is

showing through in many places, and quite a large quantity of the glass is as thin as tissue paper and breaks at the slightest touch. In the first place, minute holes are formed which enlarge until they meet and the whole surface becomes eaten away. All the Decorated glass in the cathedral is corroding in the same manner. The chapter-house windows are a little earlier and are in the worst condition, but there is no doubt that unless something is done to protect the outside surface from the atmosphere before very long the nave windows will be in the same condition.

Mr. Bodley, in his report, says:—

It is a matter that really presses, lest a storm should do much damage.

### THE KHAMi RuINS, NEAR BULAWAYO.

A PAPER by Mr. F. P. Mennell, F.G.S., curator of the Rhodesia Museum, was read before the British Association, in which he said that all over the territory between the Zambesi and the Limpopo, now known as Southern Rhodesia, are numerous structures which testify to a former occupation of the country by a race far more advanced in the arts than the Bantu tribes, who are shown by Arab records to have inhabited the country for fully two thousand years. The Khami ruins, situated twelve miles from Bulawayo, may be taken as typical. They consist of about a dozen separate structures showing the usual mortarless walls faced with carefully squared granite blocks about twice as large as an ordinary brick. These walls are about 3 feet thick and rise perpendicularly without any batter as a rule to heights of 10 to 20 feet or more. The exterior walls roughly conform to the shape of the ground available, or are more or less circular, but the interior ones ramify about in a most intricate manner. The principal ruin has three sets of walls at different levels, and as the spaces which they enclose have become filled with debris, they give the hill on which they are built a terraced appearance. The main entrance to this structure has square ends to the walls on either side, and recent excavations have revealed the fact that a series of stone-built steps lead up to it from the foot of the slope. In other cases the walls are rounded off at the entrances and rounded buttresses support them at times. Other devices in the way of decoration are the "chess-board" and "herring-bone" patterns, formed by varying the positions of the facing blocks and the introduction of dark-coloured dolomite blocks to contrast with the granite.

It has been stated that these structures could not have been roofed in, and in only one instance (Impatani) out of many hundreds is a covered entrance known. At Dhllo Dhllo ruins, however, there are the remains of wooden posts let into the masonry, and these have now been found at Khami also. It seems possible that they may have been intended, in some cases, at least, as supports for a roof. That the buildings were intended primarily as forts may be inferred from their inaccessible situations, their narrow and well-commanded entrances, and the fact that the sides of some of the hills on which they are built have evidently been artificially steepened.

Many objects of interest have been discovered at Khami, most of which are now in the Rhodesia Museum, Bulawayo. The pottery and the articles made of copper and iron are probably in nearly all cases the work of later occupants of the ruins than the builders. Discrimination is rendered difficult by the obvious fact that the natives have copied the designs of the earlier workers. This may indicate either that they are the degenerate descendants of the builders of these remarkable structures, or that their ancestors were forced to work for the latter as slaves. The second is in all probability the correct explanation. Peculiar flat oval-shaped stones, sometimes pierced with a hole near one end, are among the articles which may be regarded as ancient, and so are the numerous gold ornaments. The latter include chain and wirework, tacks for fastening beaten gold on to wood, and gold beads of all shapes and sizes and in every stage of manufacture. A few pieces of tin found in one of the smaller structures are of interest, as the metal does not appear to occur anywhere in Rhodesia. They may have been imported. Two classes of objects are conspicuous by their absence here as at all the other ruins. These are inscriptions of any kind, and iron tools such as must have been used in dressing the stone for building. The latter may well have rusted away during the thousands of years which have almost certainly elapsed since they were laid aside, but the absence of the former is not so easy to explain if these structures are the work, as has been contended, of the Sabæan of Arabia.

The Casket which was presented to Lord Roberts at Winchester was designed by Mr. H. W. Lonsdale, of Bedford Row, London. The wood employed was formerly part of a beam in the Norman roof of the cathedral.

## NOTES AND COMMENTS.

FORMAL notice has been served in Cincinnati for the erection of a building fifteen storeys high—*i.e.* about 210 feet—in which concrete and steel will form the walls. The building inspector, who has to authorise the work, appears to have felt his responsibility in approving of the experiment, and an inquiry was held by him on the subject. It was explained that the concrete construction proposed was stronger and more rigid than steel, and will stand the vibrations and strains due to wind pressure better and in a more perfect way. The strength of the structure does not depend on rivetted joints, but on the monolithic character of the concrete, being all one solid mass of stone held together by twisted steel rods and imparting to it an elasticity equivalent to that of a steel building. The architects of the building are Messrs. A. O. ELZNER & GEORGE M. ANDERSON, and the structure will be erected by the Cincinnati Fireproof Company. The building inspector of Philadelphia states that he has had a similar structure under his consideration, and that he had resolved to interpose no obstacle for its erection.

TRICCA, in Thessaly, is among the towns mentioned by HOMER in the catalogue of the ships in the "Iliad." The troops sent to Troy were described as being led by two sons of ÆSCULAPIUS, who were also mighty healers. The Temple of Æsculapius was much venerated. Tricca is now generally known as Trikkala, and excavations near it have produced interesting results. For some time the inhabitants of a neighbouring village have been secretly opening the ground on a hill where the remains of walls suggested a place of importance in ancient days. What they obtained cannot be fully ascertained. But when Dr. KASTRIOTIS, the ephorus, heard of the operations he went to the spot, and after working for two or three days was rewarded with several interesting examples. The most valuable is a bronze statuette of a hoplite, or heavily armed soldier, who bears his helmet, shield and spear. It is in good condition, and is thought to belong to the sixth century B.C. Seven lances, two sword blades, bronze vessels, buckles, nails, &c., were found, besides tiles from the roof of the temple, all marked with the same stamp, and dressed stones from the foundations. It is, however, concluded that the walls which stood on them were of wood. If possible, excavations will be conducted in other parts of the Acropolis. It was near Trikkala that a relief in marble was exhumed which represented ARTEMIS, with attendants and votaries, carrying branches of oak.

THE cantilever principle has been adopted for the viaduct which crosses in one span the valley of the river Viaur in connection with the Orleans railway. It has long been desired to establish railway communication between Carmines and Rodez. They were separated by a valley with abrupt sides. During several years various projects were brought forward, but in 1889 M. THIERRY presented a design by which the deep valley would be crossed by a bridge on the cantilever principle. Much expense was thereby saved in scaffolding. The French Government have liberally contributed towards the expenditure.

THE annual report of the Manchester Society of Architects states that the aggregate membership is 193, viz., ninety-two Fellows, fifty-two Associates and forty-nine students, as against a membership of 182 at the date of the last report, being an increase of eleven. One Fellow has resigned, four members were struck off the roll for nonpayment of subscriptions, five members died, including two past presidents, viz., Mr. R. I. BENNETT and Mr. JAMES STEVENS. Mr. ALFRED DARBYSHIRE has presented a badge to be worn by the president for the time being. The proposal to create a chair of architecture at Owens College has received much and careful consideration from the Council, and during the past year several conferences have been held on the subject. It having come to the knowledge of the Council that the Manchester Corporation were contemplating the erection of the Victoria Baths, in High Street, without first inviting architects in practice to send in competitive

drawings, the following resolution was passed:—"That this Council learns with satisfaction that the suggestion contained in the resolution of the Council, dated February 18, 1901, with regard to the appointment and duties of the city architect has been approved by the City Council; such a decision having been arrived at, it is very desirable that such an important public work as is contemplated in the erection of the Victoria Baths in High Street, involving a large expenditure, should be thrown open either to limited competition or generally to local members of the architectural profession." The students committee say they hope their branch of the Society will be taken up with renewed enthusiasm, and that all the students will endeavour to make the future meetings a success, as there is little doubt that the past ones have helped to bring them more together, and have encouraged that friendly interchange of views and criticism which is so helpful in any work.

THE English company working the quarries at Pentelicus have been fortunate in obtaining an immense block of white marble, which will serve for the podium of the great statue of WAGNER to be erected at Bayreuth. A similar block was raised for the Moltke Memorial. One of the Athenian journals considers it to be a remarkable coincidence, that the material for a memorial of the representative of the latest form of dramatic and musical entertainment should be derived from a place which was dedicated to the ever-young Dionysian BACCHUS, whose festivities originated the drama and opera.

## DESIGN FOR VICTORIAN MEMORIAL.

THE drawing is one of a set submitted in the Liverpool Victorian Memorial competition. The base is triangular, that appearing the most suitable form for the site. The materials are fine axed granite columns, &c., polished dark grey; the figures, capitals, &c., bronze. The three principal figures are Charity, Justice and Fame; the small ones Time, Death and Eternity. The band round the plinth would represent the most eminent men of the reign. The plate scales roughly  $\frac{1}{8}$  inch to a foot. The design is by Mr. C. W. JEWITT, Brecknock Studios, N.W.

### MANCHESTER SOCIETY OF ARCHITECTS.

AT the first meeting of the Manchester Society of Architects Mr. Alfred Darbyshire delivered his presidential address for the present session.

In his former address he said he alluded to the establishment of a chair of architecture at the Owens College. He had to chronicle the failure of their efforts to induce the Corporation of the city to join in the establishment of that University chair of architecture, and he also stated that their efforts would not cease till every means at their disposal was exhausted. The paramount question they had to deal with was that of endowment, so as to make the professorship worth the acceptance of a man in whom the profession would have confidence, and whose opinion on all points of artistic value would be sought and respected. It must be admitted that such a tribunal of appeal was required in dealing with artistic matters in such a city as Manchester. They were surrounded with evidences of that want of advice and control; witness the architectural settings of our public statues, and the artistic horrors and heraldic blunders made in the decoration efforts of public buildings (including the civic hall) at a Coronation time or on other occasions of public rejoicing. There were many ways in which the knowledge and culture of a professor of architecture at the University would be of great value, and without in any way conflicting with the official control of the city architect. The Corporation had now joined the movement, and with the assistance of funds promised by gentlemen interested in their art, he felt that they were now approaching a consummation which would add honour and dignity to architecture and its practice. When his term of office closed with the present session he hoped to vacate the chair with the knowledge that the chair of architecture at Owens College was an accomplished fact. After an allusion to the important question of architectural competition and the need for proper and efficient assessment, Mr. Darbyshire said it seemed to him that a fit and proper motto for the present condition of civilisation and movement was the one word, "Speed."

Science moved at such a rate in the application of its principles and discoveries to the needs of humanity and progress that the architect was bewildered, and his greatest energies were needed to keep pace with the hurried onward movement. In the architecture of our cities the architects had, and would have, the hardest tasks to perform in the application of their art to the present and probable conditions of the future. This unseemly speed and competition had engendered a utilitarian spirit, which dominated all city architecture. If a beautiful and refined façade was produced, its lines and its architectural beauties were ruined and destroyed by huge signboards in the form of cut out flaring gilt letters stuck on the elevation, often without the least respect for the lines of architecture, and to the complete destruction of what often was a costly artistic effort. Speaking of science, let them consider what electricity was doing in the way of destruction of city architecture. Hold-fasts for overhead wires were driven into and fixed on architectural façades without the slightest consideration for their artistic value. It was a matter of no consequence as to whether the buildings were public or private, and perhaps no greater instance of the hasty application of scientific requirements to the spoliation of architecture could be found than the present aspect of Albert Square in their city. It was a mass of electrical network. The fine elevations of Waterhouse were completely cut to pieces, and their beautiful lines destroyed. It was said that on the occasion of one of Ruskin's Oxford students returning from Italy he said to the great master, "The moment I entered the Florentine Gallery I knew why you have given to Botticelli such supremacy" (or words to that effect). "Indeed," said Ruskin. "You saw this in an instant. And only to think it took me twenty years to find it out. What will be the end of our civilisation if we go at this speed?" It might reasonably be asked, Could nothing be done to save the destruction of their beautiful art, and to perpetuate and maintain some of the past traditions upon which it had been based since the days of its perfection on the classic plains of Attica? He was convinced that the only reply to this interrogation was, "Let the architects of the present and all future time study the art of the past, whether pagan or Christian; from such study will be evolved the fact that whilst all past architecture was the outcome of certain eras of civilisation under climatic conditions, it never lost sight of the beautiful." A study of their art in the past would also reveal the fact that it was truthful to the requirements of the time. This was an important point and should never be lost sight of; then Christian places of worship would no longer be copies of Grecian temples, factory and workshop buildings would not violate Italian art by the use of its beautiful turrets for chimney-stacks; but the evolution of the art in the future would be truthful to the requirements of the time, and not the result of eccentric efforts at originality or merely reproductions of past examples. A new style on the instant was impossible; it was, and ever would be, the growth and requirement of time.

The modern historian who wrote the chronicle of our own time would have to recognise a topsy-turvydom unknown in the world's history. England, after its past centuries of consolidation in art, literature and intellectuality was now going at the speed which characterised the building up of the new Western world, whereas America was now consolidating in the realms of art, literature and intellectual culture. On this side of the Atlantic we did not hesitate to spoil our art with the hideous application of scientific necessities. There was little respect for existing beauty. We even went to such lengths as painting white marble statues and, he regretted to say it, in their own city, too, although they were recognised as the works of great sculptors of bygone days. Briefly, the architect of this new century had a condition of things to grapple with which would militate against the principles of beauty in architecture, and without beauty architecture became mere building, and only the exponent of science. It was a matter for serious consideration as to how their architects were to face this new condition of English civilisation. The struggle between the commercial and the beautiful would be fierce and its issue doubtful. They could only hope that under whatever new conditions and requirements architects would have to work they would, like the grand old Greeks, still love the beautiful, and so help to maintain through the coming ages the prestige of our great Empire.

On the proposition of Mr. J. B. Gass, seconded by Mr. J. W. Beaumont, a vote of thanks was accorded the President for his paper.

### BRITISH SCHOOL AT ATHENS.

THE annual meeting of the subscribers to the British School at Athens was held on Tuesday in the rooms of the Society of Antiquaries. Dr. Thomas Hodgkin, who presided, congratulated the school on the safe return of Mr. W. Loring, the honorary secretary, from the seat of war.

The report stated that the work of the school had been carried on successfully under the directorship of Mr. Bosanquet during the past session. The first student to arrive in Athens was Miss Lorimer, classical tutor at Somerville College, Oxford, early in October. After some weeks spent in country travel she devoted herself in Athens to a study of the red-figured vases of the latter half of the fifth century in the Central Museum. Another lady student, the Baroness E. Rosenörn-Lehn (University College, London), in the course of a long season at the school (from the beginning of November to the end of June) applied herself mainly to numismatic studies, making a special investigation of the representations of birds in ancient art, especially on coins. The men students were Mr. M. N. Tod, scholar of St. John's College, Oxford ("senior student"); Mr. F. W. Hasluck, scholar of King's College, Cambridge ("school student"); Mr. C. Heaton Comyn ("architectural student"); Mr. A. P. Oppé (late exhibitor of New College, Oxford), and Mr. A. E. Henderson (architect). The committee were happy to report that the design sketched out last year by Sir R. Jebb for the endowment of a studentship for research had been realised by the appointment of Mr. M. N. Tod, the "senior student," for two years. Mr. Tod's special line of study being epigraphy, he spent much time in the Epigraphic Museum at Athens, under the general direction of Dr. Wilhelm, collating and, where necessary, preparing for publication a number of difficult fourth-century inscriptions, which was shortly to appear in the *Journal of Hellenic Studies*. Mr. Hasluck arrived, with Mr. Bosanquet, at the beginning of November, and devoted the winter (1) to attendance at archaeological lectures and the acquisition of the modern language; (2) to a comprehensive study in Athens of the history and antiquities of Cyzicus, in Asia Minor, with a view to an excavation which was to have been undertaken in the spring. The excavation unfortunately was necessarily abandoned, through no fault of Mr. Hasluck, who, however, was able to collect some thirty-five unpublished inscriptions and two pieces of archaic sculpture, one of which (a sixth-century relief of Herakles) was considered of sufficient value to be removed to the Imperial Museum at Constantinople. Mr. Comyn was appointed to an "architectural studentship" in connection with the excavations in Crete. He occupied himself in the neighbourhood of Athens by making a complete set of drawings of the beautiful little Byzantine church at Daou, at the south end of Mount Pentelicus, to which Mr. Bosanquet had invited his attention. Mr. Oppé had worked steadily in the library of the school at the obscure subject of Greek oracles. Mr. Henderson was readmitted as a student for the third time, for the special purpose of the Cyzicus survey. Of the preceding year's students, Mr. J. H. Marshall had been appointed Director-General of the Archaeological Survey of India; Mr. Hopkinson had become a lecturer in Greek at the University of Birmingham; and Mr. Frost a lecturer in the Training College at Isleworth. Mr. Wells had settled down to the practice of his profession as an architect, and Mr. Penoyre

had undertaken a course of archaeological "Extension" lectures. Messrs. Fyfe and Mackenzie, formerly students of the school, had served once more as Mr. Evans's assistants at Knossos. Mr. Edgar, formerly a student of the school, and now on the staff of the Museum, Ghizeh, spent some time in Athens, working both on the catalogue of that Museum and on the report of excavations at Phylakopi. Passing to the work of the director, the committee had to record the preliminary excavation of the early site at Palaio-kastro, on the eastern coast of Crete. The excavation was carried out under the supervision of the director, with the assistance of the "architectural student" appointed for the purpose. The site appeared to have been almost untouched from Mycenaean times until the middle of the last century, and contained abundant remains of houses, large and small, of the Mycenaean period, together with numerous tombs and many hundred vases, both of that and of the earlier ("Kamaraes") epoch. The British Association had made a grant of 50*l.* for the expenses of an expert, who was to make a special study of the well-preserved skulls which had been found. The director had been busy sorting and preparing for publication the last results of the important excavations at Phylakopi in Melos. The finest specimens of pottery from Phylakopi now adorned the Mycenaean room in the Central Museum at Athens; and a number of duplicates had been brought home to England by the courteous permission of the Greek Government, and would be divided between the Ashmolean, Fitzwilliam and (probably) the British Museums. The library had been well maintained at an expense of rather more than 100*l.*, and a fresh catalogue would soon be needed. The directors of other foreign schools in Athens had again, as always, proved themselves valuable friends to the director and students; and thanks were especially due to Drs. Dörpfeld, Richardson and Wilhelm for the welcome accorded to our countrymen at their lectures. Dr. Schrader, second secretary of the German School, and Dr. Svoronos, keeper of the national collection of coins, had also earned their especial thanks. The committee regretted to have to report a deficit of 164*l.* on the year's working. It was earnestly to be hoped that this deficiency might be speedily supplied by fresh subscriptions.

The Chairman congratulated the meeting on the success of the school. In past times the zeal of archaeologists had been somewhat intermittent. Now it was to be hoped that it would be continuous, and that we should not fall behind other nations, and that no Chancellor of the Exchequer would ever lay his hands on the little grant which had been made by the Government. The details known a generation ago of early Greek history were few and uninteresting; Carlyle had bitterly complained of Thirlwall's first volume as nothing but Dolopes, Dolopes, Dolopes. Now happily that was all changed, and the dry bones were made to live, and it might be that the Pelasgians themselves would be brought into clear historic line. It was satisfactory that the British Association was helping, and that the men of science—the anthropologists—were joining hands with a classical society such as this. It would seem that the key to the Pelasgian inscriptions was possessed by the Emperor Claudius; it was, he hoped, reserved for our scholars to rediscover that key. He moved the adoption of the report.

The motion was seconded by Professor Lewis Campbell, who said that his time had been spent rather in the development than in the origin of Greek thought. It was to be hoped that the two lines of study would long continue in co-operation. The motion was unanimously carried.

Mr. Bosanquet, the director, then gave a short account of last year's work, which included the explorations in Crete.

## THE PROPOSED LONDON COUNTY HALL.

At the meeting of the London County Council on Tuesday the special committee on new offices submitted their report recommending the Council to seek Parliamentary powers for the acquisition of a site in the Adelphi for the erection of a new county hall.

Mr. Fletcher moved the reception of the report. He said that the committee had now been considering the matter for 2½ years. The present hall was never considered their permanent home. Taking into consideration the beautiful buildings provided by other public authorities in London, he asked why a body like the London County Council should hesitate in providing a proper and adequate home for itself. The real question was the adequacy of the site. It was central and accessible, and in purchasing it they would get the best value for their money. The amount to be paid was about half the cost of a similar area in Spring Gardens and Cockspur Street. He contended that if the Council was going to build its own home it should be on its own freehold. The site was also capable of extension if necessary.

Mr. Hubbard denied that there was any urgency in the matter. The Council was paying about 20,000*l.* a year in rent for its office. The proposed Adelphi site would cost them

44,000*l.* and there would be another 40,000*l.* a year for the building. He asked where the justification was for the Council to spend 80,000*l.* a year when 20,000*l.* would suffice.

Colonel Rotton complained that the Council had not been fairly treated in this matter. They were driven into a corner and had no opportunity of considering other sites. They had lost the opportunity of acquiring the Westminster Aquarium site, which could have been secured for half the sum now required. They could, too, have obtained it without the necessity of going to Parliament, and in every way it was a more suitable site than the one now proposed. The price of the Adelphi site was far too costly for the advantages to be gained.

Dr. Cooper moved the following amendment:—"That in view of the heavy rates now being levied in all the eastern and southern metropolitan boroughs, it is inadvisable to apply to Parliament for sanction to raise the large sums of money which the adoption of this scheme must necessitate, until Parliament has given to London some new source or sources of income." The proposed scheme would be useless without the widening of the Strand, the cost of which should be added to the scheme. It was altogether a bad site, and he was surprised that anyone should suggest that the Council should spend 1,000,000*l.*, and perhaps 2,000,000*l.*, on a building to be overshadowed by such a hideous monstrosity as Charing Cross station. He could, however, see no reason why they should not provide a modest building on some of the land which they had at their disposal in connection with the Holborn to Strand scheme.

Mr. Piggott said they could hardly expect to provide more ample and convenient accommodation at the same rental they were now paying. There was no country or city in the world that would attempt to carry on its business under the conditions which now obtained in regard to the Council's staff. To make their present offices tenable they had spent over 25,000*l.* No site could be more central than the proposed one at the Adelphi, facing the Embankment. He could not imagine a more suitable site for light, air or accessibility. When they had acquired the site they would find that they already had about three acres of garden under their own control right in front of them.

Lord Welby, the chairman of the finance committee, pointed out that in the year 1904-5, when the first charges under this scheme, if passed, would have to be met, the charges for the Holborn to Strand scheme would have reached their maximum, as well as those for the electrification of the tramways, and there would be a largely increased charge on the rates for the first, whilst the income from the trams would probably almost disappear. In view, therefore, of these facts he urged delay, and declared that it would not be prudent or sound finance, and would be dangerous to real Progressive policy if they hurried on this scheme for a new county hall, which would involve an undue charge on the year 1904-5.

Mr. Elliott thought the Council's present buildings sufficed, and that it was unnecessary for all the staff to be under one roof.

Mr. Burns, M.P., said that owing to the prevarication of the Council many possible sites were passing out of their hands. Were they going to wait until Carnegie came along and gave them a hall for nothing? He hoped not. The truth was the Council urgently needed a good and substantial building. It was impossible for the Council to do its work properly when its fifteen departments were housed in seven different buildings, in some cases a quarter to a half-mile apart. He would not have objected to the Aquarium site. Next to that, the Adelphi was the best site. It was very accessible and central, and would complete the link of national, social and municipal buildings for which the Embankment was so well suited. He did not want an hôtel de ville, but he wanted a solid, dignified building that Londoners could regard as their own, and in which their representatives could properly do their work.

Dr. Longstaff said there was a magnificent site, commanding quietude for committee business, available at an exceedingly reasonable price, and were such an opportunity allowed to pass it might never occur again. The freeholder of a large portion of the site had behaved with great courtesy to the Council.

The Council divided—

For the amendment	29
Against	78
Majority against	—49

On the motion of Colonel Rotton, the debate was adjourned.

A letter has been addressed by Mr. Alfred L. Cohen to his colleagues on the London County Council concerning their proposal to expend 900,000*l.* on the acquisition of Adelphi Terrace as a site and another 1,000,000*l.* on the erection of buildings thereon for a county hall and adjacent offices. The building of a county hall, he says, will take years, and will cost millions, and he proposes an amendment. Is it really essential, he asks, to concentrate every department of the Council on one spot? There may be certain advantages in so doing, but these advantages are counterbalanced by the enormous cost.

Perhaps the most practical solution of the difficulty is for the committee to decide what departments should remain at Spring Gardens and what should go to a less costly quarter, and the committees controlling the various departments could meet in the houses where their officials are at work, and on spots less costly than the Adelphi. Mr. Cohen desires to remind the Council that its present debt amounts to 52,749,682*l.* 11*s.* 5*d.*, and that its capital commitments amounted in March last to 18,207,000*l.*, so giving a total of 70,956,682*l.* 11*s.* 5*d.* Further, is it wise to add to this enormous debt a sum of 900,000*l.* in the acquisition alone of a site on land in a back street, and on which a building eight storeys high is to be erected, which would accommodate only 850 officials, while the present staff is already 897? If, however, the Council should determine to abandon its present building and build a new one, Mr. Cohen points out that, though the cost of the Adelphi site is stated to compare favourably with the other sites which have been considered, it compares unfavourably with at least one site that does not seem to have been considered, but is available and more accessible. If the Council go south of the Thames there is a site available east of Westminster Bridge, between the Westminster Bridge Road and the works dépôt, which, in the opinion of the valuer, could be purchased, including compensation, for 650,000*l.*, and contains an area of 4.1 acres. By the expenditure of about 21,000*l.* in the construction of an embankment wall in line with the embankment of St. Thomas's Hospital, and the payment of a fine of 10,000*l.* to the Thames Conservancy, the foreshore could be reclaimed and thereby an addition of 1.3 acres secured, so that a total area of 5.4 acres could be secured for 681,000*l.*, the Adelphi site, 3.35 acres, costing more money and giving less accommodation. Mr. Cohen urges the consideration of the South London site on grounds of economy, of beauty, and of great convenience of access.

#### ARCHITECTURAL ASSOCIATION OF IRELAND.

THE first general sessional meeting of the Irish Association was held on the 7th inst. in Dublin. Mr. F. G. Hicks, president, occupied the chair.

The annual report was read by Mr. Beckett, one of the hon. secretaries, and briefly recounted the work of last session and the various lectures delivered by prominent members of the profession. The report recorded regretfully that the attendance at the classes last year was not all that could have been desired. In membership and finance the Association was in a flourishing condition.

Mr. Holloway moved the adoption of the report.

Mr. Allberry, in seconding the motion, suggested that another secretary should be appointed to take charge of the reports for the technical and daily papers. He also thought it would be a good thing to try and get the Irish Institute of Architects to hold examinations. They could then draft a syllabus which pupils would be ready to take up in order to be examined in Ireland on Irish lines.

The report was adopted.

Prizes won during the past session were then distributed, the following being the successful competitors:—

Architects' Institute Prize—Mr. John Knox Vinycomb.

The Doolin Prize—Mr. John Knox Vinycomb.

The Beckett Prize—Mr. F. H. Tallan.

First Prize, Class of Design—Mr. F. H. Tallan.

Second Prize, Class of Design—Mr. G. Hamilton Barlee.

The President then delivered his inaugural address, which contained many valuable suggestions for the improvement of the Association. In the course of his remarks, which were frequently applauded, the President said he was not going to bring forward any very new or startling ideas. He proposed to talk of themselves and address his remarks chiefly to the younger members of the Association. The education of students in the past had been practically nil, and even now it was of a more or less haphazard and imperfect description, and the chief object of the Association was to promote and afford facilities for the study of architecture, which was a very comprehensive word. It took the London Association fifty years to discover that their educational system was not all that could be desired, and a revolution resulted in their present apparently complete and up-to-date system. They should profit by that experience and look for defects as they went along and supply the necessary improvements if possible. They had difficulties here to contend with of which they knew nothing in London. Their little roll of 131 members, compared with that of London of 1,400 seemed ridiculously small, and any falling off in classes or meetings was at once apparent. From their very scarcity of members it behoved each one to do his utmost to make their teaching a credit to Dublin in particular and Ireland in general. One of the chief defects of their system, so far as he could see, was that it was practically aimless. They commenced each session with exactly the same kind of subjects, advanced a certain distance and then stopped. All this to his mind was wrong. A

student, perhaps serving his four years' articles, could not possibly learn all there was to know about a subject in one session, and yet they could not expect him, however necessary it might be, to go over the same ground year after year. He thought if they were to be of any real benefit as an educational body they should formulate a proper curriculum of study, spreading over two or three sessions, commencing with elementary subjects and concluding with those more advanced, and at the end let there be a test as to what the man had learned. They could hardly grant diplomas, but something in the nature of a certificate might be given as evidence of the course of study gone through and progress made. A great want to students was a pamphlet setting forth the qualifications they should possess and the subjects it was absolutely necessary to take up. It seemed to him that the Institute should be up and doing—should they not insist on candidates seeking admission presenting themselves for examination? That would be one of the surest ways of guarding the interests of the profession, and that he believed was the principal object of the Institute. Their glorious profession involved life-long study, and they should follow the old masters, and strive after the poetry and imagination which inspired them. Their city of Dublin, with its many fine monuments and lovely natural surroundings, full of tradition, should be and could be one of the most beautiful cities of the world. They should do their best to make it so. One looked with sorrow at the ravages caused by the jerry-builder, and he regretted to say there were jerry-architects quite as much to blame, and asked, need these things be? With regard to their teaching arrangements for the present session, single responsible lecturers had been appointed who would conduct the course in place of the group of instructors as heretofore. That was only a small beginning of a scheme which they hoped would be eventually more or less perfected. Another necessary addition was a studio, where students both young and old could meet at all times, do a little modelling or perspective and interchange ideas. A studio, however, would hardly be possible until they got premises of their own, and the sooner they faced the problem the better. Mr. Hicks also drew attention to the necessity of accurate drawing and draughtsmanship, and laid special stress on the value of sketching to the architect. They should go to nature for inspiration, and she would never fail them. Above all, enthusiasm was requisite—burning, infectious enthusiasm—which would carry them through all kinds of trouble to ultimate success.

Mr. C. J. MacCarthy, in moving a vote of thanks to the President for his address, congratulated the Association on having such an eloquent and practical gentleman in the chair. He might also take the opportunity of congratulating Mr. Hicks himself on a recent event. Lord Iveagh, with great generosity, was about to erect a market in Dublin, which he is to build entirely at his own expense and hand over to the citizens. He invited designs from all architects resident in Ireland. Eight only responded to that invitation, but still including some of the most distinguished Irish architects, and as a result of that competition the prize was awarded to Mr. Hicks. He (Mr. MacCarthy) believed with the President that architectural education in Dublin was sadly neglected, and that the younger members of their profession were not taught in the way they should be. Something must be done in the immediate future for the improvement of architectural education.

Mr. G. P. Sheridan seconded the motion, which was passed with acclamation.

The President having briefly acknowledged the compliment, the meeting concluded.

#### PHOTOGRAPHS AS EVIDENCE IN COMPENSATION CASES.

ON Tuesday Mr. Under-Sheriff Burchell and a special jury, at Red Lion Square, Holborn, heard the case of Matthews v. the Great Northern and City Railway Company, a claim for compensation in respect of structural injury alleged to have been caused to the leasehold premises Nos. 110 and 126 New North Road, by subsidence due to the construction of the new "tube" railway from Finsbury Park to the City. The claimant stated that from the end of the year 1900 until recently various structural defects had developed. The wife of a tenant stated that the creaking and cracking noises at night were such that she thought the house was haunted. Mr. Houchin, an architect, and other witnesses expressed the opinion that in addition to being recouped for the outlay on repairs, the claimant ought to receive compensation for the probable diminution of the market value of the leases. On behalf of the company, counsel contended that the method by which the "tubes" are constructed, by means of the "Great-head shield," precluded the possibility of any movement or subsidence of the soil through which they are driven; and that the houses in question were sixty or seventy years old and rested on

very shallow foundations. Mr. Douglas Young (vice-president of the Auctioneers' Institute) stated that before the commencement of operations the promoters took the precaution to photograph the houses and other buildings along the route, and that the photograph of one of the houses in question revealed an extensive crack which was in existence long before the line was made. Mr. Daniel Watney stated that the condition of the houses was such as he would expect to find, having regard to their age and the class of building. Mr. E. A. Gruning and Mr. Howard Chatfield Clarke, architects, Mr. Leslie R. Vigers, surveyor, and Mr. Johnston, engineer to Messrs. Pearson, the contractors for the line, also gave evidence. The Under-Sheriff, in summing up, said that if the jury came to the conclusion that the photograph which had been produced was accurate it must materially reduce their award, assuming they found that any damage was done by the "tube" railway. The jury found as follows:—"The verdict is unanimous for the defendant company that damage has not been done by the construction of the 'tube,' but that it is the work of time."

### THE HAWARDEN GLADSTONE MEMORIAL.

**S**T. DEINIOL'S Library, Hawarden, which has been erected as a national memorial to Mr. Gladstone at the cost of 10,000*l.*, was opened by Earl Spencer on Tuesday. It has been placed on the brow of the hill at Hawarden, and commands a view over the estuary of the Dee. The foundation-stone, laid by the late Duke of Westminster, bears the following inscription:—"In this building, erected to his memory by a grateful nation, is preserved the library of William Ewart Gladstone, who, eminent no less as theologian than as statesman, established this foundation for the advancement of Divine learning. This stone was laid in the presence of the Lord Bishop of the Diocese by the Duke of Westminster., K.G., October 1899. G. E. Joyce, warden." Externally the building is faced with Helsby stone, a red sandstone, and the roof is covered with dark-green Buttermere slates. Designed in the Gothic style, with mullioned windows, the building at once expresses the purpose for which it is destined. The interior consists of two large rooms, one for divinity and the other humanity, with galleries round and open-timbered roofs of oak. There are, besides, studies and rooms for the wardens. The floors are laid with oak blocks, and the columns and gallery front are enriched with carving and tracery-work, which add greatly to the effect of the large rooms. The oak bookcase fittings are of simple character on the lines of those devised by Mr. Gladstone, and his method of placing them to economise space has been largely followed. To the right of the library, attached to it, will come the hostel and warden's residence, when the necessary funds to build are forthcoming. Messrs. Douglas & Minshull, of Chester, were the architects. Mr. Gladstone had stored his great collection of books in a temporary stone building close to, and on the removal of the volumes a few weeks ago great care was taken to transfer them to the shelves of the new building in the same order. Some time ago the volumes available for students, who are required to belong to no particular sect or nationality, numbered nearly 35,000, but as an endowment has been left with the library, the number is gradually increasing.

### THE LONDON TOPOGRAPHICAL SOCIETY.

**O**N Wednesday the annual meeting of the London Topographical Society was held, the Earl of Rosebery, president, in the chair.

Lord Rosebery, in the course of his speech, said:—"There must be thousands and thousands of opulent people in London with much leisure, of whom London is the home, though they may make holiday excursions from it, who should be interested in the past history of this great capital, who should not be content merely to become members of this Society and receive the results of the work of others, but should also take part in that work themselves. For my part, the indifference of the public to our proceedings—I do not altogether blame it, because we do not advertise ourselves, and success without advertisement in these days is hopeless of achievement—is almost an inexplicable symptom."

For, after all, London is changing before our eyes. It has been changing during the last quarter of a century with inconceivable rapidity, but that rapidity has been almost duplicated and triplicated since the advent of the London County Council. What ancient streets it is going to cut through in that great new avenue for which it cannot find a name; what are to be the demolitions entailed by that anonymous crescent, which all the sagacity of our municipal legislators has failed to christen? I do not dare to reckon, but I do not doubt that among my three colleagues in the chairmanship of the London County Council there must be a guilty feeling that at this moment the march of

utility is going to stamp out some venerable dwellings, some ancient associations, which dwellers in London would gladly have spared if that were possible. But as these destructions are inevitable, and must go on with the development of London, surely the least we can do is to preserve for our descendants the exact picture of what was, and what has ceased to exist, both in the shape of maps of streets that were, and also of representations of ancient and interesting buildings which have been destroyed. I do not profess to be an expert like Mr. Wheatley or Mr. Gomme, but I never examine a print of an old house, such as Bedford House, in Bloomsbury Square, which has so many political associations, or any sketch of the old palace at Whitehall, which has almost entirely disappeared—the ground plan of which the Society has produced—I never come across any trivial prints of that kind without feeling a desire that they should be preserved, and so give this Victorian and Edwardian London which we inhabit some flavour or aroma of the historical London of the past, without some knowledge of which, after all, so much of our political history is unintelligible. If we are to do this, as I think it ought to be done, and as it is not in the least likely that any public body, borough council or other, will spend the rates in doing so, it is necessary that some small nucleus should be formed of people who are earnest in this matter, and who wish to preserve for the instruction of future generations some picture of the fast vanishing London as it is. That is the function which we present to ourselves in the first place. But we also have in view the reproduction of rare maps, of some of which, as Mr. Gomme has told you, only one or two copies exist; and, therefore, in the interest of their preservation it is most desirable that copies should be made by some association or other. Even if no member of our society wish to preserve in his house copies of these maps, yet, in the interests of the general public, it is most desirable that they should be multiplied, so that in case of accident or fire the maps may not altogether disappear. I think that is a public-spirited work which deserves the encouragement of the people at large.

But from another point of view our work has been very imperfectly developed. We have but one meagre, and I suppose what Milton would have called scrannelled, volume of our annals. What we should aim at is very much what Mr. Gomme indicated—the culling from various volumes, such as the publications of the Master of the Rolls, those passages which have reference to London and which only extreme and diligent exploration would enable the student to find for himself. There ought to be a London library—I do not mean the estimable institution in St. James's Square—but a library of London books such as have been published by other societies—by the Surtees Society, for example, with regard to the north—a library of books relating to London, reprints of scarce volumes, excerpts from massive volumes which do not altogether relate to London, documents bearing upon London—a whole collection which would be invaluable to the future and present student, and which only such a Society as ours could bring into being. I regret the death of Sir Walter Besant, who would have taken such an ardent interest in the efforts of our Society and would have popularised it so much; but, in his absence, if with very feeble halting accents, we can summon, we can call, I think, the people of London to remember their duty in regard to this particular and to give their support ungrudgingly to the public-spirited efforts of this Society. I am convinced that, when once it is known, it will receive that support, and I hope it will be given in no grudging or reticent spirit, but that before the next meeting of the Society we shall be unable to meet in this generously afforded room from want of accommodation for our members. To my mind it has been the great spiritual function of the London County Council, as apart from its material efforts, which have been open to criticism and question by its enemies—it has been the great spiritual function of the London County Council, which no one has questioned or criticised, to make us feel the unity, the splendour and the historical association of London as a whole. In our humble way, though we have not the power and the dignity of the London County Council, we may do much to advance that work. It is for that reason I am proud to accept the offer you have made me, and to remain—in- efficient as I am, and as I admit I am—in this capacity—President of the London Topographical Society.

**A Plumber** named Coaker was summoned by the Islington Borough Council this week for having improperly set a soil-pipe. The evidence showed that the defendant had run molten lead into the joints where it was easily observable, but at the back of the pipe the joints were stuffed with rags and paper. The defendant said that he was assaulted on the work and was unable to supervise the men. The magistrate said it was monstrous, and fined the defendant 40*s.*, with a penalty of 20*s.* per day for fourteen days—16*l.* in all—with the alternative of a month's imprisonment.

**TESSERÆ.****"Hearthstone."**

IN London the demand for stone has at all times been considerable. During the long period that the chief supplies for highly decorated buildings were imported from Normandy various circumstances must have occurred to delay the arrival of cargoes. Political disputes between the two countries most probably occasioned the importation of Caen stone to be altogether prohibited. At such intervals the rocks nearest to the Metropolis would necessarily be made available, and accordingly in almost all old buildings we find occasionally introduced large portions of stone from the vicinity of Reigate and Godstone, known by the various names of Reigate stone, Gatton stone, Merstham stone, firestone and more commonly as hearthstone. This material must always have been expensive in London, on account of the distance to fetch it, being twenty miles land carriage. It may be very expeditiously worked; nevertheless it ought not to be used for external purposes, for it would be difficult to meet with an instance where it has been exposed to the atmosphere for twenty or thirty years without the surface having mouldered away in small flakes, so as ultimately to obliterate all architectural details. The greater part of Westminster Abbey was formerly built with stone brought from quarries at Godstone, from which circumstance that village is said to have derived its name. Sir Christopher Wren, in alluding to the repairs of the Abbey, describes the stonework as having mouldered away 4 inches deep from the original surface. He repaired the parts most decayed with stone "brought down the river from near Burford, in Oxfordshire." A specimen of this reparation may be seen on the exterior of the north transept and on the north side of the choir, as far as Henry VII.'s Chapel. Reigate stone was not entirely out of use in the time of James I., for Inigo Jones introduced it in part of the front of Whitehall. The festoons of fruit, &c., on a line with the capitals of the upper columns were originally carved in this stone, and so much decomposed before the repairs in 1826 that they were taken down, and new ones, executed in Portland stone, were substituted. While both Caen and Reigate stones were in general use for ornamental architecture, large quantities of hard grey limestone, generally known by the name of Kentish rag, were brought to London by water from the neighbourhood of Maidstone, and extensively used for ruder purposes. The basement, or plinth next the ground of Henry VII.'s Chapel at Westminster is formed of this stone, and large masses of wall of the same material were found in digging the foundations for the Houses of Parliament. About this time, or soon after the year 1600, Portland became the general stone used for superior buildings in London and the south of England.

**Roman Remains.**

The position of Roman remains in England and on the Continent is wholly different. Among the nations of the Romance speech, Roman remains are not only far more abundant and in far better preservation than they are here; they occupy a wholly different historical position. No doubt there are wide differences in different parts even of what is now France. The nearer we draw to the imperial centre itself the more numerous are the Roman buildings and the greater the influence which they have had on the style of later buildings. A perceptible difference in this respect may be felt between Normandy and England, between Aquitaine and Normandy, between Provence and Aquitaine. And of these the gap which separates England and Normandy would seem to be the narrowest of all. The reason is plain; the Norman settlement in Neustria was much more like the English settlement in Britain than it was like the Frankish and Gothic conquests elsewhere. The Scandinavian settlers retained the sites of the Roman cities and gradually learned the Romance language; still the continuity between Roman and later times is much feebler in Normandy than it is in other parts of Gaul. Normandy, in this, as in many other respects, presents a state of things intermediate between the phenomena of the Continent and those of our island. Setting therefore that transitional district aside, we find the position of Roman remains and their historical value altogether different in England and on the Continent. In France and much more in Provence and Italy, the connection with Roman times is continuous. It goes on in language, in nomenclature, in art, in institutions, in everything. No impassable gulf separates the present from the Roman past, the change has been great but it has been perfectly gradual. We suspect that the great French Revolution, which no living men can remember, was really a ruder snapping of ties between past and present than any Gothic or even Frankish conquest. The actual Roman remains are constantly found standing above ground; sometimes Roman buildings remain in so perfect a state that they can be applied to some modern use. In England, Roman remains standing above ground are rare and fragmentary, except in the case, which is only another illustration of the same general law, of

places like Pevensey and Burgh, where the Roman walls of a forsaken city remain perfect, or nearly so. There is no Roman building in England which can be applied to any modern use; indeed the great mass of our Roman antiquities consist not of buildings at all, but of inscriptions and objects of various kinds, themselves for the most part quite fragmentary, dug out of the earth in Roman sites.

**Harmony in Architecture.**

There is harmony in the plan of an edifice when the whole appears to be the result of one mind; when all the distributions, each according to its respective use, co-operate in one general purpose; when each part, in connection with its use, seems to be only the effect of the necessity dictated by the pleasure of producing symmetry; and when, in short, by means of clear and simple lines, easily to be understood, art has united, in a manner both varied and uniform, the subordinate parts of the projected undertaking in such a way that nothing appears to have been forced into difficult combinations, but that everything is the result of necessity, and could not have been otherwise than it is. The harmony of the plan ought to become the principle and basis of the general elevation; although in some instances an exception may be made to this rule, as far as certain palace fronts are concerned, which have no connection with a general whole. Harmony of elevation consists primarily in the correct proportions of the length, breadth, height and depth, which the eye in viewing a building seizes upon readily. This sort of harmony between the principal dimensions constitutes a part of the system of proportion, of which the works of nature and the conformation of the human frame afford examples up to a certain point. No precise rule, however, can be laid down concerning this, as circumstances, depending upon locality, prospect and position, ought to be taken into consideration by the architect, which cannot be reduced to general principles. The most important principle of harmony which requires to be observed in elevations is that which so disposes of the masses (the peculiar arrangement of which must depend on the general style of the building) as to point out clearly the exact destination of each, and at the same time to preserve the degree of unity between them which is necessary to make them seem parts of one whole. But this quality is unfortunately one of the rarest that we meet with when we examine the construction of existing edifices. Harmony in decoration, both in theory and practice, is perhaps easier to understand and to observe. Each order shows us, by its proportions and by the affinities that are established between its form and its ornaments, the rule and pattern of true decorative harmony. Light or delicate ornaments, as may be easily perceived, would ill suit an order expressive of strength and solidity, and *vice versa*. An enlightened feeling in the inventors of the orders led them to proportion to the degree of strength expressed by each the lightness or richness of the ornaments to be employed. We thus find those columns which, from the proportion of their breadth to their height, must necessarily be the strongest the least laden with ornament; and the consequence of this is that, if an order suitable to the object in view has been fixed on and its proper decorations are observed, harmony between the use and appearance of the building will be the result.

**Style in Art and Literature.**

There is a considerable difference between what we imply by the abstract term "style" in art and the meaning of the same word as applied to literature. It is incomparably more important in the former case than in the latter, and for this reason—that in art the means of signifying a thing is the actual representation, image or partial realisation of it, whereas in literature or speech it is a mere conventional symbol, having no intrinsic resemblance whatever to the thing signified. The word "man," for instance, is nothing beyond three letters and a sound; but the picture man is a real man in form and colour. Or we might make the practice of picture-writing serve as our illustration. The excellence of literary style in picture-writing would consist simply in clearness and conciseness, but the excellence of artistic style (supposing it to be aimed at here as in an ordinary picture) would present a real and fine image of the thing itself. Now the difference between the most slovenly and diffuse and the most emphatic and concise style of picture-writing, as read off into words would be extremely small compared with the difference between the meanest and the finest pictured form, considered as real representations. The worst distinctive picture word for King Sesostris would still read "King Sesostris" very nearly as well as the best; but fancy the difference between the worst distinctive and the highest characteristic or ideal portraiture of King Sesostris as a work of art. This of course is an extreme illustration of our position, but it is not a false one. Of course, too, style is important in literature, but it is not so important, nor does the term there in its widest acceptation imply nearly so much as in the narrowest it does in art. For in art you cannot have a fine, a noble, a bold or a timid style without having therein a

fine, noble, bold or timid representation or actual image of the thing signified. In fact, style in art may be said to include everything beyond the choice and conception of the subject itself, and the mere accuracy or otherwise of its embodiment. It is thus a third of the whole battle, being, in one word, the artist's embodied perceptive (as distinct from his conceptive) faculty, and no school can be great in style without being *ipso facto* great in art. That Michel Angelo chose noble subjects and conceived or thought them out greatly, was not a matter of style, nor yet that he drew or coloured them accurately, when he did so, but that he represented them nobly was a matter of style. The term includes all the rest of his performance in art. In like manner, the whole difference between the early Italian, the French and the British schools is difference in subject and conception, in accuracy and in style. If a Frenchman and an Englishman both choose one domestic subject and both paint it accurately, one might at first blush assume that the two pictures would be greatly alike; but they would not prove so, the styles would be sure to be extremely diverse. It will be observed that we are not here speaking of the minor differences of style, or what is more properly termed "manner" between artist and artist, but of the dominant way of looking at things and of expressing them—of style as a many-phased but permanent element in all art.

### Chinese Cities.

There is scarcely any difference between the greatest part of the cities of China, they are all nearly alike, so that seeing one is sufficient to give an idea of all the rest. They are for the most part square when the situation admits of it, and surrounded with high walls, with towers built against them at proper distances. They have sometimes ditches, either dry or full of water. The gates of the cities, though they are not adorned with figures in bas-reliefs like other public works, surprise very much by the prodigious height of the two pavilions that form them; by their vaults or arches that in some places are of marble; by their thickness and by the strength of the work. Triumphal arches in the streets, tolerably handsome temples consecrated to idols, or monuments erected to the memory of the heroes, and of those who have done some important service to the state and for the public good; in short, many public structures are more remarkable for their vast extent than for their magnificence. Add to this some pretty large squares, long streets, some very wide, others but narrow, the houses on each side having only a ground floor or one storey higher. There are shops adorned with Chinese ware, silks and japanned goods. Before the door of every shop there is placed a pedestal; upon this is fixed a board 7 or 8 feet high, either painted or gilt, on which board are written three large characters, which the tradesman chooses for the sign of his shop.

### The Vocation to Art.

In the arts the most flattering indications of talent are often found to be fallacious; gleams of ability frequently brighten the first years of study, which afterwards prove to have been false lights, tending only to render the subsequent darkness more conspicuous. There is a kind of superficial ingenuity, well calculated to take the lead in drawing-schools and academies, which, assuming all the airs of genius, often passes for that quality amongst inaccurate observers; but this glittering tinsel kind of talent rarely attains to eminence, it belongs more to the hand than the head, and most commonly ends in a manufacture of mannered insipidity and unfeeling mechanism. But if it be thus difficult for the student to estimate with accuracy the extent of his abilities for the fine arts, it is doubly incumbent on him at least to ascertain the strength of his attachment to them; let him beware lest, as the text observes, "he transient liking take for lasting love;" lest his disposition to painting should prove but the fickle avidity of a child, who this moment seizes his plaything with rapture, and the next throws it from him with disgust. Enthusiasm, though not always a sign of genius, is always essential to excellence; nothing great or elevated in poetry or painting was ever produced without it; it is the only quality which can enable the mind to surmount the obstructions of difficulty and support the pressure of disappointment. A strong love for the art is always good security for a steady application to it; and without steady unremitting application the best opportunities are lost and the best abilities unavailing. The young votary of art should therefore look into his own mind with attention and examine its dispositions; he should contemplate the profession he is about to adopt not only in its pleasures but in its pains, in its defeats as well as its successes. Let him reflect that what has hitherto captivated him as the amusement of his life, leisure must now become the serious occupation of his life, losing (like all serious occupations) much of its agreeable character in the obligation by which he is bound to it, demanding an attention undivided, a patience inexhaustible, and a perseverance steady and energetic under every change of

humours, seasons and situations. If on this candid examination he finds not in his breast a passion for the art that rises superior to remonstrance, that cannot calculate consequences or compromise with prudence; if he can balance advantages, if he can doubt or hesitate, let him be assured that his call is not genuine; let him lay aside his pencil, and forbear to toil in a pursuit for which he wants the most essential qualification, which can tend only to unfit him for common enjoyments, and expose him to all the misery of disappointed hopes and mortified pretensions.

### Primary Colours.

The "colours of light" are as much under the dominion of science as the varieties of sound. Taste and genius may possibly do everything in art in ignorance of scientific principle, but such principle exists, nevertheless, and cannot be appealed from. There is a very beautiful optical experiment, probably not generally known in art—a knowledge of it will not make a colourist, though every colourist ought to know it. Place the three primary colours, red, yellow and blue in their relative proportions, around a circle (as in the experiment for producing a white light from them, by a rapid rotatory motion), mix up from these three colours, taking only two contiguous ones at each time, the principals of a secondary circle, or the second principals of the first circle, and you will obtain at intermediate points the less pure colours of orange, green and purple. Between each of these six colours introduce farther intermixtures. Let them stand thus:—Red, orange red, red orange, orange, yellow orange, orange yellow, yellow, and so on with the whole circle. This may be called the primary circle, and exhibits the richest and most brilliant colours in nature. Then take the secondary colours out of this primary circle and place them as primary colours in a secondary circle—take out the orange, green and purple, and by mixing two of each as before, a third set of principals will result—olive, slate and brown—for orange and green with the prismatic rays makes an olive colour—purple and green, a slate colour—and purple and orange, a brown colour. Intermix them as before and you have a second circle of eighteen colours. Take from this secondary circle its secondary colours—olive, brown and slate, and by the same process form a third circle of eighteen colours still more corrupted, and the three circles will probably be found to comprise almost every tint that is reflected to the eye from natural objects. It may be also added that in each circle every colour, whether primary or corrupted, is to be found diametrically opposed to its contrast or complementary colour, and with that contrast, however corrupted each may be, even of the third circle, will reflect the white solar beam when subjected to a rotatory motion. The Italian painters revelled in the primary circle, for their more brilliant sun developed the local colours of objects more effectually. They painted in a higher key and luxuriated in the more vivid and uncorrupted beams of coloured light. The Dutch and Flemish painters, from the obstruction of the sun's rays, occasioned by their humid atmosphere, were accustomed to more corrupted colours, and with them, as with us in England, the primary colours are called gaudy, "while sentiment delights in drab." Earth and sky, water and land, usually display the same dull monotonous garb; even the streets, the human beings who walk them, and the houses which the latter inhabit, rejoice in the same melancholy absence of coloured light during the greater part of the year.

### Sulgrave Manor.

SIR,—Absence from town has delayed attention to the reports, which, I find, have been so industriously circulated during the past few weeks, to the effect that the management of the Universal Exposition, St. Louis, 1904, have made overtures to owners or agents for the purchase and removal of the house known as Sulgrave Manor, the ancestral home, in Northamptonshire, of one branch of the Washington family. I therefore bespeak space in your columns to say that no such thing has been so much as thought of or suggested, much less seriously considered. Perhaps I may be permitted to assure the public that the exposition authorities do not contemplate the transfer, from England or any other country, of buildings or monuments which have become interesting, either by lapse of time or by association with men and events.

Even if the management were inclined thus to proceed with the Sulgrave Manor House, they would, I fear, scarcely have time before the close of the exposition to enter upon the prolonged discussions and contentions, or to decide the

disputes and doubts apparently inevitable when the Washington genealogy is involved. If they should muster courage to enter upon such a course, they might face the necessity from time to time for adding another building to their list. As Pope's interrogatory line suggests that there is a tendency among doctors to disagree, so the student, with an interest however slight in heraldry, is forced to conclude that the same conditions are not wholly wanting in the genealogists who, drawn from all quarters of the globe, deal with the origin and history of the English Washingtons—I am, Sir, very truly yours,

GEORGE F. PARKER,

Commissioner in the United Kingdom of  
the Universal Exposition.

Sanctuary House, Tothill Street, S.W.: Oct. 11.

### GENERAL.

**The Liverpool Cathedral Committee** have decided to confine the final competition to the five architects selected by the advisory architects. They are Messrs. Austin & Paley, Lancaster; Mr. C. A. Nicholson, New Square, London; Mr. G. Gilbert Scott, York Mansions, London; Mr. Malcom Stark, Little College Street, London; and Mr. W. J. Tapper, Raymond Buildings, London.

**The Statue of General Gordon**, which was lately exhibited near Trafalgar Square, has been rescued uninjured from the Thames. The report of the marine surveyor of the Salvage Association is as follows:—"Skeleton case, containing a statue of General Gordon on camel, in bronze. This package has been under water, and much mud was deposited on the statue. The mud has been washed off as far as possible by the use of the ship's hose. The case is not broken or otherwise injured. We recommend in the interest of all concerned that it be forwarded to destination."

**Mr. H. Syer Cuming**, a vice-president of the British Archaeological Association, died on Tuesday in last week, in his eighty-sixth year. Mr. Cuming was widely known among antiquaries, his museum of interesting and valuable natural and artificial rarities, of which his father, the late Richard Cuming, laid the foundation in 1782, being among the best privately owned collections of the kind. The museum, with 8,000*l.* for its maintenance, has been bequeathed to the Walworth Road Public Library.

**A Statue of the late W. E. Gladstone**, by Mr. Thornycroft, R.A., was unveiled in George Square, Glasgow, by Lord Rosebery. The statesman is represented in his robes as Lord Rector of the University.

**A Special Committee** of the Newcastle Town Council have recommended the erection of three large blocks of dwellings in different neighbourhoods to be let in single and pair-room tenements. The scheme will give accommodation for 1,200 people at a charge of 2*s.* per room per week.

**The Parish Church of St. John's, Hoxton**, which has been closed for restoration and decoration during the past three months, was reopened on Tuesday. The walls and galleries are of a terra-cotta colour relieved with gold, while the ceiling has a blue background, and is divided into compartments containing pictures of angels and other figures described in the Book of Revelation. The church is lighted by electric light. The decoration has been carried out by Messrs. Campbell Smith & Co. at a cost of 4,000*l.* under the supervision of Mr. Reeves, architect.

**At a County Meeting** at Northampton to further a movement for erecting a public memorial to Northamptonshire men who were killed in action, or who died from wounds or disease in the war, it was resolved to fill the great west window of Peterborough Cathedral with coloured glass as a memorial, and the erection of a tablet containing the names of all the county soldiers and sailors who fell in the war. The window will be designed by Mr. G. F. Bodley, R.A., and the cost of the memorial will be about 1,200*l.*, half of which has been subscribed. It is proposed to erect an additional memorial in Northampton town hall to the Northampton men who fell in the war.

**The Mayor of Margate** last Friday performed the ceremony of cutting the first sod in connection with the new water-supply for Margate at the source, Wingham. Over 12 miles of main will be laid, and an expenditure of about 100,000*l.* will be required.

**A Girder** weighing 8 tons was being hoisted by a crane at the new War Office buildings in Whitehall on Tuesday, when the wire cable broke and the girder crashed through a series of platforms, carrying everything before it. No one was hurt.

**A Marriage** has been arranged and will take place in January, between Mr. R. A. Briggs, F.R.I.B.A., of 32 Holland Park Avenue and 12 Norfolk Street, Strand, son of the late Mr. Henry Briggs, of Shorefield, Prittlewell, Essex, and Mysie, daughter of the late Mr. E. Fox White, of 57 Lexham Gardens, South Kensington, and Thursley Hall, Haslemere, Hants.

**M. Rouville**, who was one of the engineers-in-chief to the "ponts et chaussées" of France, has presented to the State 60,000 francs for the purpose of founding a quinquennial prize of about 10,000 francs for the engineers of "ponts et chaussées" of every grade.

**The Building Act Committee** of the London County Council recommended that the new street from Holborn to the Strand should be called "Edward VII. Street," and the crescent "Gladstone Crescent." At the meeting on Tuesday the motion was withdrawn.

**The College of Heralds**, at the request of the Chelsea Borough Council, has drawn up a design of a coat-of-arms for Chelsea. The Council has submitted its wishes, and the college has translated them into heraldic language. The scarlet quarters of the shield bear golden devices in the following order:—In the first quarter is an ox, the symbol of St. Luke, who is the patron saint of the parish; in the second quarter the arms of Lord Cadogan, the lord of the manor; in the third an adaptation of the arms of the Sloane family; and in the fourth a stag's head from the arms of Stanley. An abbot's staff in the centre has reference to the Abbey of Westminster, the ancient lords of the manor.

**The Scaffolding** which is necessary for the examination and reparation of the façade of the Madeleine, Paris, is now in process of erection.

**Lieutenant-Colonel Boudin**, a Chevalier of the Legion of Honour, died suddenly in the Louvre before a painting on which his admiration appeared to be concentrated.

**The Bishop of Rochester** consecrated the new church of St. Bartholomew, Wycliffe Road, Lavender Hill, on Tuesday, Mr. G. Fellowes Prynne being the architect of the building. The cost is 8,500*l.*

**Madame Lefeuil**, the widow of the late Hector Martin Lefeuil, has died in Paris. He was the successor of Visconti at the Louvre, and the interior of the new part is in a great measure to be ascribed to him. He died in 1880.

**The Secretary of War** has recognised the advantages of the removal of the Duke of York's School, Chelsea, and though no actual decision has been arrived at on the subject, in all probability steps will be taken shortly to secure a site adaptable for the purposes of the institution in some healthy country district. It is felt that it would be to the advantage of the school in many ways if it were housed in modern buildings and with better facilities for playing-fields.

**Langtoft Church**, near Driffield, Yorkshire, has been restored and enlarged under the direction of Mr. C. Hodgson Fowler, F.S.A. Sir Tatton Sykes paid all expenses.

**The Report of the Council of University College, Liverpool**, states that a sum of 4,666*l.* had been advanced for the purchase of land in Brownlow Street, so securing a site of exceptional value for college extension. The committee also voted a sum of 20,000*l.* to complete the buildings of the medical school. The Council recently made further applications for help—to build new laboratories, urgently required by the departments of zoology and electrotechnics; to provide for the extension of the Victoria building, now seriously overcrowded.

**The Collection Dutuit** is expected to be opened in December in the Petit Palais of the Champs-Élysées. The works are being arranged by M. Georges Cain.

**The Royal Scottish Society of Painters in Water-Colours** opened their exhibition last week in their galleries in Glasgow. The drawings number 236.

**Sir C. Douglas Fox** recommends the erection of a lift by which the tramway-cars would be raised and lowered in Halifax in order to continue the extension to Greetland. The lift would cost 10,000*l.* more than an alternative scheme.

**The General Electric Company** have settled six claims for compensation under the Workmen's Compensation Act, which were brought by girls who on the occasion of the recent fire at Queen Victoria Street had to jump from the fourth storey. Each of the girls is to receive 150*l.*, and the City of London Court will invest 154*l.* until the girls are twenty-one years of age.

**A Memorial Statue of Queen Victoria** was unveiled at Leamington on Saturday. The statue is of Carrara marble and was sculptured by Mr. Albert Toft. Her Majesty is represented in a standing position holding the sceptre and orb. The statue is placed in front of the municipal buildings and has cost 1,600 guineas.

**The Liverpool Architectural Society** will hold its first members' meeting at the Free Public Library, William Brown Street, by kind permission of Mr. Peter Cowell, chief librarian, on Monday, October 20, at 6 P.M., when a selection of the chief architectural books, including various new works, will be on view.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

DURBAN (NATAL).—Dec. 18.—Designs are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

## CONTRACTS OPEN.

ACCRINGTON.—Oct. 21.—For new works, Spring Hill, for Lang Bridge, Ltd.: (contract No. 2) erection and completion of the superstructures; (3) supply and fixing of constructional iron and steelwork. Mr. Henry Ross, architect, 15 Cannon Street, Accrington.

ACTON.—Oct. 21.—For erection of a house for the engineer at the Acton sewer works. Mr. D. J. Ebbetts, surveyor, 242 High Street, Acton, W.

ASTON.—Oct. 31.—For condensers for electricity station. Mr. Reginald P. Wilson, 66 Victoria Street, London.

BECKENHAM.—Oct. 27.—For erection of a timber platform over the covered swimming-bath, 100 feet by 30 feet in area, with a movable stage, &c. Mr. John A. Angell, surveyor, Town Hall, Beckenham, Kent.

BEVERLEY.—Oct. 22.—For erection of a house for the clerk and steward of the East Riding asylum. Mr. C. W. Hobson, clerk to the asylum, Newbegin, Beverley.

BILSTON.—Nov. 3.—For carrying-out the alterations and extensions of Lower Gornal Robert Street Infants' School, Coseley. Mr. A. Ramsell, architect, 187 Wolverhampton Street, Dudley.

BIRMINGHAM.—Oct. 20.—For supplying and fixing eaves and gutters at the workhouse, Gravelly Hill, Aston. Mr. John North, clerk, Union Offices, Vauxhall Road, Birmingham.

BISHOP AUCKLAND.—Nov. 6.—For erection of an administrative block, main pavilion, isolation pavilion, porter's lodge and outbathing block, laundry and disinfecting block, covered ways, boundary walls and fences, water supply, drainage, roads, &c., at the No. 2 isolation hospital buildings at Helmington Row. Mr. William Perkins, architect, Victoria Street, Bishop Auckland.

BRADFORD.—Oct. 24.—For erection of a Board school at Grange Road, Bradford. Messrs. T. C. Hope & Son, architects, 23 Bank Street, Bradford.

BRIDLINGTON.—Oct. 20.—For construction of underground lavatories in South Cliff Road. Mr. A. E. Matthewman, town clerk, Bridlington.

BRIERLEY HILL.—Oct. 21.—For erection of a technical school and free library at Brierley Hill, Staffs. Mr. William Waldron, clerk, U.D.C., 17 High Street, Brierley Hill.

BRIGHTON.—Nov. 5.—For alterations to part of the Royal Pavilion in Palace Place to adapt the premises to the purposes of a telephone exchange, &c. Mr. Francis J. C. May, surveyor, Town Hall, Brighton.

BRISTOL.—Oct. 21.—For erection of a lodge and construction of roads at Novers Hospital. Particulars on application to the City Engineer, 63 Queen Square, Bristol.

BROMSGROVE.—Nov. 15.—For erection of the first portion of the proposed new lunatic asylum on the Barnsley Hall estate, near Bromsgrove, Worcestershire. Mr. George T. Hine, architect, 35 Parliament Street, Westminster.

BURTON-UPON-TRENT.—Oct. 22.—For erection of a car depôt in Horninglow Street. Particulars may be obtained at the Borough Engineer's Offices, Town Hall, Burton-upon-Trent.

CAMBUSNETHAN.—Oct. 21.—For supply of pipes, cut, lay and fill in about 4,000 yards of drains (average depth, 7 feet) in connection with the extension to Cambusnethan cemetery. Mr. James Graham, cemetery superintendent, Cambusnethan, Wishaw.

CARLTON.—Oct. 22.—For erection of isolation hospital at Carlton, Notts. Mr. Fred Hopkinson, architect, 40 Bridge Street, Worksop.

COALVILLE.—Nov. 4.—For supply and delivery of the pipes and specials required in the construction of new waterworks. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

COALVILLE.—Nov. 4.—For supply and delivery of No. 192 sluice, air and reflux valves, No. 219 screw-down hydrants, No. 89 expansion joints, and No. 4 Deacon's waste-detecting meters, with other fittings, surface boxes, name plates and posts required in the construction of new waterworks. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

## SPECIALTY.

## ERECTION OF ROUND FACTORY CHIMNEY-STACKS

ON THE

## "CUSTODIS SYSTEM,"

With Specially Constructed Patent Blocks.

Phons Custodis Chimney Construction Co., SHEFFIELD.

**COALVILLE.**—Nov. 4.—For construction of a service reservoir to hold 500,000 gallons, the laying and jointing of mains, fixing fittings and testing and other work required in the construction of new waterworks. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

**COALVILLE.**—Nov. 4.—For erection at the proposed new pumping station of two compound inverted tandem pumping engines, each capable of lifting not less than 240,000 gallons of water in twelve hours, and two steel Lancashire boilers, 6 feet 6 inches diameter, 20 feet long, including steam and water pipe connections and fittings, foundation bolts, plates and girders, overhead traveller, &c. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

**COCKERMOUTH.**—For repairs and pointing of the chapel steeple at the cemetery. Mr. T. Cuthbert Burn, clerk, Main Street, Cockermouth.

**CREWE.**—Oct. 28.—For erection of a diphtheria pavilion for twelve beds and other additions to the isolation hospital. Mr. G. E. Bolshaw, architect, 189 Lord Street, Southport.

**CRONDALL.**—Oct. 20.—For erection of a cottage at the district school, Whimble Hill, Crondall, Hants. Mr. A. H. Guyer, architect, South Street, Farnham.

**DARTMOUTH.**—Nov. 3.—For construction of about 2,500 feet of 9-inch earthenware pipe sewers, with manholes, lamp-holes, road gully, pits, &c. Mr. A. Smith, borough engineer and surveyor, Dartmouth.

**DEWSBURY.**—Oct. 20.—For alterations at the Boothroyd Lane Board school, Dewsbury. Mr. F. W. Ridgway, architect, Bond Street, Dewsbury.

**DOVER.**—Oct. 24.—For erection of new coastguard buildings, consisting of quarters for an officer and seven men, with watchroom, &c., at East Cliff, near Dover. Particulars may be obtained at the Coastguard Station, East Cliff.

**GOLCAR.**—Oct. 20.—For erection of a weaving-shed and warehouse (floor area 25,582 square feet) at Stanley Mills, Golcar, Yorks. Mr. Arthur Shaw, architect, Golcar.

**GREENWICH.**—Oct. 28.—For supplying and fixing a five-brake h p gas engine for chaff-cutting purposes, at the Council's depôt, Banning Street, East Greenwich. Particulars can be obtained from the Borough Engineer and Surveyor, Town Hall, Greenwich Road.

**GREENWICH.**—Oct. 29.—For the work of taking up the existing flooring of the dust shoot jetty at the Council's depôt,

Banning Street, East Greenwich, and relaying the same with 3-inch pine. Mr. Francis S. Robinson, town clerk, Town Hall, Greenwich Road, S.E.

**HARROGATE.**—Nov. 1.—For supply, delivery and erection of a hydraulic water-motor pump capable of lifting 150 gallons of water per minute to a height of about 100 feet, together with the necessary inlet, outlet, waste and suction pipes, also valves and other connections. Mr. Edward Wilson Dixon, engineer, 14 Albert Street, Harrogate.

**HEMSWORTH.**—Oct. 20.—For erection of ten dwelling-houses, &c., at Hemsworth, Yorks. Messrs. Tennant & Bagley, architects, Pontefract.

**HILL END, ST. ALBANS.**—Oct. 27.—For construction of drains, sewers, manholes, ventilators, sewage tanks, bacteriological filters, sewage and effluent pipes, water carriers, laying-out land, &c., in connection with the asylum. Mr. Baldwin Latham, engineer, Parliament Mansions, Victoria Street, Westminster.

**HUDDERSFIELD.**—Oct. 24.—For erection of two semi-detached villa residences in Park Drive. Mr. J. Berry, architect, 3 Market Place, Huddersfield.

**IRELAND.**—Oct. 20.—For supply of 3,000 to 4,000 tons of steel bull-head rails, with the necessary fish plates, for the Great Northern Railway of Ireland. Mr. T. Morrison, secretary, Amiens Street, Dublin.

**IRELAND.**—Oct. 22.—For additions and repairs to Newtown Cunningham Catholic chapel. Mr. Daniel Conroy, architect, 21 Shipquay Street, Londonderry.

**IRELAND.**—Oct. 22.—For erection of a block of shops and offices in Arthur Street, Belfast. Messrs. Young & Mackenzie, Scottish Provident Buildings, Belfast.

**IRELAND.**—Oct. 22.—For erection of eighty-four labourers' cottages in the South Dublin Rural District, viz. fifteen cottages, under four contracts, in Clondalkin electoral division; fifteen cottages, under seven contracts, in Palmerston electoral division; thirty-seven cottages, under fourteen contracts, in Tallaght electoral division; and seventeen cottages, under nine contracts, in Whitechurch electoral division. Mr. T. J. Byrne, surveyor, 1 James's Street, Dublin.

**IRELAND.**—Oct. 25.—For additions and alterations to the nurses' apartments at the workhouse infirmary, Londonderry. Mr. M. A. Robinson, architect, Richmond Street, Londonderry.

### HOW WE LOSE TRADE.

THIS is how we lose our markets. A correspondent, who did not expect his statement to be published, tells a story of the recent fire at Frank da Costa & Co.'s rubber stores in Para. In the office were six safes, one each of English, German, French and Portuguese manufacture and two of American make. When the English safe was opened 35,000*l.* was found in an unrecognisable mass. When the Yankee product was inspected, money, books and papers were practically uninjured.

The above paragraph appears in our contemporary the *Sum*. We fancy the statement that the English-made safe was so unfortunate must be inaccurate as far as our leading safe makers of this country go. We have no hesitation whatever in stating they can vie both for strength and finish with any American or other foreign manufacturer.

ON the question of the erection of a new theatre for Aberdeen the Town Council of the city have taken action which, it is expected, will result in an early commencement with the scheme. They agreed to the application on behalf of the Robert Arthur Theatres Company, Ltd., for a feu of a piece of ground on the north side of Rosemount viaduct, adjoining the Free South church, and this site, which has a frontage of 117 feet to Rosemount viaduct, is to be exposed for sale by public roup at the upset feu duty of 234*l.* per annum. The building has to be completed within two years from the term of entry, which is to be at Martinmas of this year, and the first half-year's feu is to be payable at Whit Sunday 1905. It is stipulated that the walls of the building fronting Rosemount viaduct shall be of fine axed granite, and in the event of an ornamental portico or porch being erected the columns shall be retired to the same line as the columns of the Free South church.

BATHS FOR SMALL DWELLINGS.

THE time when a bath-room was considered a luxury even in good-class houses and one hardly to be expected in those of medium size has now happily passed away, and the luxury of yesterday has to-day become a necessity.  
That it is equally so in smaller dwellings is obvious, but the working man who wants it most least often finds this accommodation, although believing that cleanliness is next to Godliness, and knowing that it is the greatest security for healthiness.  
The reason for the absence of a bath-room in small houses is not far to seek. In every town the cost of the ground, high price of materials and increased wages of the operatives leaves comparatively but a small return on the outlay, and it is not possible to provide better accommodation without further expenditure, which will be unproductive unless an increased rent be charged, and to get that will be found difficult.

But this, we believe, need no longer account for the absence of a bath having an ample hot and cold water supply, even in the smallest house, as we will show this accommodation can now be added without any increase in the cost of building. This is effected by the introduction of a combined bath, sink and wash-boiler which was exhibited at the Health Exhibition held in connection with the recent Sanitary Congress at Manchester, where it attracted considerable attention and received much favourable comment. A brief description will enable our readers to readily understand the principle and its advantages. In place of the usual sinkstone is used one made of artificial stone 5 feet 8 inches by 2 feet, having a dish in the centre, a drainer at one end, and a circular rabbeted hole at the other, into which is placed a wash-boiler made of sheet copper, tinned inside, fitted with hinged lid and a brass tap near the bottom. Beneath the sinkstone is fitted the bath mounted on small rollers, and at the narrow end the brass outlet is fixed by a swivel arrangement to a wrought-iron outlet pipe, which are both either fixed to or buried in the floor, forming a pivot, so that the head of the bath can be drawn into the kitchen. Fig. 1 shows the sinkstone,

the method of fixing the boiler and the bath. The boiler is filled from the ordinary tap by attaching a short length of rubber pipe, and is heated by a patent multitubular Bunsen gas burner. As the hot water is drawn off into the bath the boiler is replenished from the cold-water tap and a continuous supply of hot water is obtained until the bath is filled. The waste pipe of the sink is carried behind the bath into a gully outside.  
We have gone into the question of cost of the sink, boiler and fittings and bath, and find that it is no more than an ordinary

kitchen sink and built-up wash boiler, but the adoption of this system would be greatly appreciated by the tenant, and the owner should find an increasing demand for houses so fitted. Fig. 2 shows the bath fixed, but not made to draw out into the room. In this case the sink is made of enamelled iron secured to the underside of a strong hardwood frame,

and hinged so as to lift up when the bath is required, and below the waste grate a spigot fits into a cone when the bath is down; while the outlet to the bath is attached by a union to the waste pipe carried through the wall to the sink gully. A separate cold-water tap for supplying the boiler is recommended for this bath.

The advantages of this system are many—no bath-room is required, there is no chimney or flue, any level floor will do for fixing, the hot-water supply is independent of the kitchen fire, there are no circulation pipes to burst with the frost, no more space is required than for an ordinary sinkstone and built-up boiler, and they are easily fixed by an ordinary workman. These baths are being introduced by the Kitchen Bath Fitment Company, 515 Queen's Road, Sheffield, who no doubt will be ready to give fuller particulars.

THE Batley Town Council have decided to defer the erection of a new town hall *sine die*. It has been resolved, however, to rebuild and enlarge the present hall (which was recently damaged by fire), so as to provide council-chambers, police-court and municipal offices under one roof.

### TRAMWAYS ON THE EMBANKMENT.

THE proposal put forward by the London County Council for the construction of an underground electric tramway over Westminster Bridge and along the Embankment, which was rejected by the Lords' committee, is to be revived. At an early meeting of the Council the highways committee intend to recommend that application be made in the next session of Parliament for powers for the construction by the Council of a double line of tramways from the present terminus in Westminster Bridge Road *via* Westminster Bridge, Victoria Embankment and that portion of the subway authorised by the London County Council (Subways and Tramways) Act, 1902, between the Strand and the Embankment to join at a point near the Strand the underground tramway authorised by that Act. In their report upon the matter the highways committee point out that the end to be aimed at is the provision of through facilities for persons to travel north and south, and that object will be gained if the scheme is made complete by establishing a connection between the Council's tramways at the Westminster Bridge terminus and the underground tramway at the Strand. The cost of making this line, if constructed on the underground conduit system of electrical traction, will be about 51,500l., to which must be added the cost of equipment. The committee are advised that the line will in all probability be remunerative from the outset if there is sufficient traffic to warrant a half-minute or even a three-quarter minute service.

### INSTITUTION OF CIVIL ENGINEERS.

THE Council of the Institution of Civil Engineers have, in addition to the medals and prizes given for communications discussed at the meetings of the Institution in the last session, made the following awards in respect of other papers dealt with in 1901-2:—A Telford gold medal to J. Macfarlane Gray, London; a George Stephenson gold medal to R. Price-Williams, London; a Watt gold medal to W. Bell Dawson, M.A., D.Sc., Ottawa; Telford premiums to W. R. Cooper, M.A., B.Sc., London; E. M. De Burgh, Sydney, N.S.W.; George Wilson, D.Sc., Manchester; Frank Oswell, B.A., Buenos Ayres; A. W. Brightmore, D.Sc., London; a Crampton prize to C. D. H. Braine, Mowbray, Cape Colony; the Manby premium to B. W. Ritso, Cape Town.

For students' papers the awards are:—A Miller scholarship

## CABOT'S INSULATING & DEAFENING QUILT

### A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

### A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decemur, moth, and vermin-proof, and uninflamable.

### FIREPROOF, DEADENING.

A fireproofing result infinitely superior that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

### CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

CORRESPONDENCE.

Rifle Shooting as a Winter Pursuit for Working Men and Lads.

SIR,—May I ask you to afford a little space in the columns of your paper to bring again to the notice of your readers the objects of the Society of Working Men's Rifle Clubs, of which Field-Marshal Earl Roberts is president?

This Society was inaugurated at a meeting at the Mansion House in the Spring of last year, and since the publication of the last letter on the subject in December last has been instrumental in forming thirty-six miniature rifle clubs. Considering the difficulties which beset the path of every new institution, it will be admitted that our record is by no means a bad one.

The Society was formed for the purpose of affording facilities to the working classes to become skilled in the handling of the rifle. Its aim is to induce large numbers of wage-earning people to occasionally utilise their evenings—the only time which is at their disposal—in a manner which, while interesting to themselves, will also prove profitable to the State.

There are many places which, used only partially for other purposes, could be temporarily utilised during the winter season for rifle shooting. To establish a rifle club fully equipped with the apparatus recommended, rifles, &c., a hall or room of 40 feet or more in length is required, and a sum of 15*l.* will more than cover the initial cost, whilst without the apparatus a small club could be started for 5*l.* The profit on the sale of ammunition and a small subscription from members will cover the cost of maintenance.

The committee of the Society has just published a little book showing the best means of forming and conducting a miniature rifle club, and a copy will be gladly sent free of charge to any person interested in the subject. Samples of various kinds of apparatus recommended for use as indoor ranges can be seen at the Society's offices, 17 Victoria Street, Westminster, at any time, and any information on the subject

of miniature rifle shooting will be supplied on application to the Secretary at that address.

The committee are now arranging the details of a miniature "Bisley," *i.e.* a competition open to all miniature rifle clubs, to be held in March next. Some valuable prizes have already been offered, and full particulars of this competition will be forwarded to all clubs desiring to enter.

Thanking you in anticipation for inserting this letter,—I am, dear sir, yours obediently,

FRED LANCE, Lieut.-General.

Acting Chairman of the Committee,  
Society of Working Men's Rifle Clubs.

17 Victoria Street, Westminster, S.W.

TRADE NOTES.

ON and after October 13 the telegraphic address of the Ruabon Coal and Coke Company will be "Dennis, Ruabon."

MESSRS. HANDYSIDE & CO., LTD., of Derby, makers of steelwork for bridges, roofs, &c, have just completed the steelwork for the new building at Watford for Messrs. Bemrose & Sons, of Derby and London.

THE Columbian Fireproofing Company, Ltd., of 37 King William Street, E.C., have just obtained the contract for fire-proof floors and roofs for the large bakeries at Fulham for Messrs. Macfarlane, Lang & Co., of Glasgow, as well as for branch banks at Manchester and Deptford for the London City and Midland Bank, of Threadneedle Street.

WE have received from the Permanent Decorative Glass Company, Ltd, of 36 Basinghall Street, some samples of their "Florite" opal wall tiling, a new mural decoration, which consists of opalescent and various tinted glass tiles, which by means of a specially prepared backing are easily and permanently fixed. A notable feature of this Company's tiles is the method of decoration employed on them, in which the design, which is in various colours and very artistic style, is applied by a patent process which, it is claimed, is absolutely indestructible. Designs *en suite* for dado, filling, frieze and borders can thus be supplied, and forms a complete wall treatment of a novel, effective and permanent description, which, while eminently pleasing, is comparatively inexpensive, and is certainly worthy of the attention of the architect and the decorator.

## ELECTRIC NOTES.

THE tramways and electric-light committee of the Aston Manor Urban District Council have received the sanction of the Local Government Board to the loan of 52,436*l.* for electric lighting, payable in twenty-five years. The committee will also recommend that the following scale of charges be approved for the supply of electricity for all purposes in the district, viz. 1*½d.* a unit for twenty-two hours a day, 6*d.* a unit for the remaining two hours; that the Council's tramway and electrical experts, with the surveyor, have advised them that the character of the district is not suitable for centre pole construction, and, in the circumstances, they have given instructions for the adoption of side poles, to include span wires, to be erected.

A REPORT on electric lighting and power for the Auckland (N.Z.) Harbour Board by Mr. W. G. T. Goodman has been presented, and states that electricity as a power for crane and capstan work is far more suitable than hydraulic or steam power, and estimates the number of lamps required at 40 arc lamps and 737 incandescent lamps of 16 c-p. He strongly recommends the direct-current system, and submits two sample systems. Taking all the circumstances into consideration, concludes the report, it would be cheaper for the board to obtain the power either from the City Council, if the latter erect a generating station, or from the tramway company if it will undertake the supply.

AT a recent meeting of the Wednesbury Town Council the Mayor proposed the adoption of a scheme of electric lighting, to be carried out by the Corporation in conjunction with an agreement which it was recommended should be entered into with the Midland Electric Power Company for the supply by the latter to the Corporation of electric energy in bulk for both power and lighting purposes. His Worship explained that the Corporation originally obtained a provisional order for the supply of electricity within the borough, but after taking the whole of the circumstances into account it was considered advisable to arrange for a supply from the company in question, and terms had been arranged which were satisfactory to both sides. This was a matter for congratulation, as it would enable the Corporation to supply the public at a reasonable rate. Mr. Davies said he believed Wednesbury would by this arrangement be able to supply electricity at a lower rate than neighbouring towns were able to do. The resolution was unanimously passed, and it was agreed to apply for sanction to a loan of 11,000*l.* to defray the cost of the work.

THE members of the New Mills (Cheshire) Urban District Council have had an important project before them. At a recent meeting Messrs. Rowcliffe & Co., solicitors, Manchester, wrote saying they were about to apply on behalf of an influential syndicate of local gentlemen for Parliamentary powers to erect electric generating stations and lay mains for the supply of electricity and power-gas throughout the district, comprising the county of Chester, the northern portion of the county of Stafford and the north-western corner of Derbyshire (including New Mills district) to the boundary of the Chapel-en-le-Frith Union, which was not included in the Derby and Notts Act. The area of the district is about 1,770 square miles, with a population of about a million and a half. Within this area there are four county boroughs, twelve boroughs, forty-four urban districts and twenty-eight rural districts. The scheme will be on the same lines generally as the Lancashire Electric Power Act, and the districts will join up to the districts of the Lancashire, Yorkshire, Derbyshire and Notts Act. The chief object of the company is to supply electricity and produce gas for power purposes, and although it would be prepared to supply local authorities with electricity in bulk for lighting and other purposes within their own areas, and, indeed, would be placed by the Act under obligation to do so if required at much cheaper rates than they could produce it for themselves, the company's business would lie in the directions heretofore practically untouched by local authorities. They asked for the co-operation and help of the Council in an undertaking which could not fail to be of great benefit to the district and place it on a par with other districts where similar undertakings will in due time be in full operation. Full details of the scheme would be supplied to the Council in due course and the Council deferred full consideration of the matter until those details are supplied.

## VARIETIES.

THE new Rise Carr Board schools, Darlington, were opened on Friday last.

THE new building erected by the Manchester Municipality at a cost of 300,000*l.* for the purposes of a school of technology, was formally opened by the Premier on Wednesday last.

BOLTON Hall, the seat of Lord Bolton, situate about 2 miles from Leyburn, in Yorkshire, was practically destroyed by fire on Wednesday night.

**STOVES**  
**BRATT COLBRAN & CO.**  
10 Morlimer St. London, W.

THE bridge which has been erected over the Water of Leith by the Calder district committee of the Mid-Lothian County Council at a cost of 350*l.* was opened on Saturday afternoon.

A STACK of bricks at Messrs. Doulton's brickworks, St. Helens, collapsed on Saturday, and two men named Patrick Horan and James Knox, who were removing bricks, were killed.

A FINE new block of buildings erected by the Keighley Corporation at the corner of Cooke Lane and College Street, at an outlay of about 4,000*l.*, as offices, show and work-rooms for the gas department, have just been brought into use.

THE shelter erected by the church members and friends of All Hallows, in the churchyard adjoining the church in London Wall, for the people employed in the City arriving at Liverpool Street and Broad Street stations in the early mornings, was formally dedicated by the Lord Bishop of London on Saturday afternoon.

WE understand that a new theatre is to be erected in a very prominent position in the High Street of Colchester. It is to cost 1,100*l.*, and plans have been prepared by Mr. J. W. Start, architect of that town, and 54 New Broad Street, E.C., and building operations will be commenced almost immediately.

MR. ANDREW CARNEGIE visited Falkirk on the 10th inst. in connection with the opening of the new Falkirk Public Library just erected in Hope Street, towards the cost of which Mr. Carnegie contributed a sum of 3,000*l.* The library, which is expected to cost about 7,000*l.*, provides extensive as well as very convenient premises. The front building is two storeys in height, and the back one storey, with basement flat. The principal or street floor contains the reading-room, lending library, reference library, librarian's room, &c. The upper floor contains a recreation-room (which can also be used for lectures, &c.), lecturer's retiring-room, &c. In the basement are large work-room, staff-room, heating apparatus, &c.

MR. B. T. BATSFORD, of High Holborn, announces that a book entitled "Facts on Fire Prevention," edited by Mr. Edwin D. Sachs, and embodying results of investigations with fire-resisting materials by the Fire Prevention Committee will be issued towards the end of this month. The book, which forms two volumes of 220 pages each, profusely illustrated from photographs and drawings, deals with floor construction, partition construction, ceilings, window and door protection, all subjects of considerable immediate importance, both in respect to the practice of building in London and the various proposed

amendments in the Building Act and factory regulations. The volumes contain facts only, as distinct from views and criticisms, and the book is intended as a standard work of reference.

THE following candidates from the Midlands are among those who have passed the examination for the professional associateship of the Surveyors' Institution, of which body the first ordinary general meeting in the approaching session will be held on November 10:—Mr. Arthur Ward Ashton (Oswestry), who has also secured the Beadel prize in the examination; Mr. R. W. Brealey (Leek), Mr. R. C. Holbech (Bennett's Hill, Birmingham), Mr. R. B. Lees (Congleton), Mr. A. D. Orchard (Hereford), Mr. H. B. Owen (Newcastle, Staffordshire), Mr. L. E. Shone (Whitchurch) and Mr. H. O. Young (Rock Ferry, Cheshire); in addition to a number of non-student candidates, among whom are Mr. J. T. C. Hazledine (Shrewsbury), to whom have been awarded the Driver prize and the Penfold silver medal, Mr. A. E. Jones (Newcastle, Staffordshire) and Mr. J. E. H. Stooke (Danesmere, Herefordshire), Mr. R. A. E. Every-Clayton (of the Blackmore Park Estate Office, Hanley Castle) and Mr. Gilbert Pinson (of Corporation Street, Birmingham), it is announced, are among the professional associates who have qualified by examination for the fellowship of the Institution.

THE Glasgow Hippodrome—the latest addition to the amusements of that city—was formally inaugurated last week by a full-dress performance of the first programme, which has since been offered to the public. The hippodrome is situated in the Panorama Buildings in Sauchiehall Street, occupying what has been successively the stage of a panorama, a skating-rink and a variety theatre. Its chief feature is a sinking arena, the construction and dimensions of which are similar to the London Hippodrome. The ring by an elaborate mechanical contrivance can in one minute be converted into a huge lake of water. This is contained in a tank composed of steel boiler plates, which when full holds 100,000 gallons of water, rests on a framework of steel girders, and they in their turn are supported on dwarf concrete walls. Inside the tank is fitted a rising and falling platform constructed of eight steel girders, on which a teak wooden floor is laid. This platform, on which the performances take place, is raised by a powerful hydraulic ram capable of lifting 50 tons. The building throughout is lighted by electricity. Mr. James Miller, the architect of Glasgow International Exhibition, has carried out the numerous alterations required to transform the building to its present state.

**BUILDING AND BUILDERS.**

THE memorial-stone of the overflow ward which is being erected at Kidderminster Infirmary by Mrs. William Adam, of Elderslie, in memory of her late husband at a cost of about £1,000, was laid on Monday afternoon.

AN extension of Covent Garden Market is about to be erected to accommodate the French flower market. It will be two storeys high and will be covered with a glass lantern light. The wrought-iron girders are being fixed and hopes are entertained that the building will be completed and ready for opening by Christmas. In architectural style and material it will harmonise with the other imposing departments of the market.

A RESOLUTION has been come to by the Central District committee of Stirlingshire to proceed with additions to the fever hospital at Bannockburn at an estimated cost of £4,014, exclusive of architect's fees, legal expenses, furnishings, &c. They have also agreed to apply to the standing joint committee for power to borrow £4,000 for the erection of the buildings.

THE ceremony of cutting the first sod in connection with the new water supply for Margate was performed on Friday last by the Mayor of the borough at the source of supply, Wingham. The undertaking, which will involve the laying of over twelve miles of main, and an expenditure of something like £100,000, and will give an unlimited supply of good water, has been for several years under consideration, but Parliamentary powers have only recently been obtained. Following the ceremony a large company were entertained by the Mayor to a luncheon at the Red Lion hotel, Wingham.

AT a meeting of the Aberdeen Town Council a report was submitted by the slaughterhouse committee recommending the erection of a public slaughterhouse at the Central Park at an estimated cost of £22,000. Strong opposition was offered on behalf of the residents of the Kittybrewster district, which, it was urged, would be injured as a residential quarter if an abattoir were erected there. Objection was also taken on the ground that railway facilities could not be procured. By sixteen votes to twelve the report was approved, and it was agreed to apply in next session of Parliament for power to borrow £30,000 to defray the cost.

THE foundation-stone of St. Margaret's Church, Dalton-in-Furness, was laid on the 11th inst. by Lady Evelyn Cavendish, whose husband, Mr. Victor Cavendish, M.P., is lay rector of

the parish. Up till quite recently service has been held in an iron structure, which has done duty for thirty-one years, but this has been demolished and a handsome building of stone is being erected in its place to accommodate 600 worshippers. The style is a simple rendering of the Early English or Lancelot period of Gothic architecture, in which ornament has been very sparingly used and good effect obtained by simple outline and proportion of parts. The architect is Mr. R. B. Preston, of Manchester. The cost of the new church is estimated at about £4,000.

AT Whitby the foundation-stones have been laid of a Methodist church and schools in Church Street. The new church will consist of spacious entrance vestibule, two staircases to the gallery, which will seat about 200 persons, the area on the ground floor also seating the same number, making the total accommodation about 400. The style is Classic adapted to the situation. The church, including the recess for orchestra, will be about 55 feet long by 34 feet 6 inches inside. The schoolroom behind the church will be 51 feet by 25 feet, and can be divided into one room 25 feet by 25 feet, with four classrooms 12 feet 6 inches square, by folding screens. The builders are Messrs J. Braim & Sons, Whitby, and the architect Mr. W. G. Smithson, of Leeds, while the cost will be about £4,000.

THE council of the Y.M.C.A. Association, Birmingham, are now going forward with the first portion of the scheme for the new premises, which are to be erected on the site of St. Peter's Church, Dale End. Tenders were received from fifteen firms of builders, and at the last meeting of the council it was decided to adopt the report of the building committee, recommending the acceptance of that of Mr. William Bishop, of King's Heath, at the sum of £18,977. The contractor has already commenced to demolish the church, and it is anticipated that rapid progress will be made. The foundation-stone laying ceremony is fixed for Tuesday, November 4. The first portion of the scheme, including the freehold site of 2,300 square yards, will involve an outlay of some £30,000.

THE Countess Beauchamp laid the foundation-stone at the Wyche, Worcester, of a new church. A site was procured near the present school chapel. Though it proved expensive, it was the only one obtainable, and upon this a church, which will accommodate some 250 people, is being erected. The building will command a magnificent prospect to the east, lying as it does high up on the side of the hill. It will be of substantial construction, but no money will be laid out in

expensive ornamentation. There will be a nave 73 feet long and 28 feet wide, with a small apse, separated from the nave by a chancel arch. At the south-west corner will stand a porch, and a smaller one at the north-east angle of the nave, close to which will be the choir, vestry and organ chamber. Owing to the great fall of the land eastward a considerable space is available under that end of the church, and this will form a vestry-room. The nave windows will be of the lancet type, and a three-light window is to be placed at the west end. The cost of the church will be about 3,000*l*.

At a recent meeting of the Stoke-on-Trent Board of Guardians, Mr H. M. Williamson (chairman) presiding, there was a long discussion with respect to the plans for the proposed alterations and additions to the workhouse, involving an expenditure of 32,600*l*. The Chairman moved a resolution embracing the adoption of the plans (which the Local Government Board had approved), the expenditure of the sum of 26,600*l*. and the borrowing of that sum, repayable within thirty years. Mr. G. Poole pointed out that the plans included costly roadways and extensive covered ways which were perfectly unnecessary, and he suggested that these should be eliminated. Mr. R. Cooper suggested that they should do away with the whole scheme, remarking that it would be a sin and a shame to spend all this money during the present state of trade. Mr. J. Coates (mayor of Hanley) said it would be a mistake in the way of extravagance to go on with the whole scheme. Mr. Coates moved as an amendment that, considering the high rates of the district, the guardians could not see their way to approve the plans which estimated an expenditure of 32,600*l*, and instructing the buildings and estates committee to consider the desirability of utilising the schools for male inmates and the erection of a new dining-room only. Mr. H. Emery seconded the motion. After prolonged discussion, Mr. Coates's amendment was carried by ten votes to seven. In reply to a question, the Clerk said the preparation of plans and other work done by the architect would cost from 700*l*. to 800*l*.

MR. R. DEANE SWEETING, M.B., Local Government Board inspector, held a meeting at the Town Hall, Maldon, Essex, on the 1st inst., to consider the application of the Maldon Joint Hospital Board to the Local Government Board for sanction to borrow 4,500*l*. for the provision of an isolation hospital. Answering the inspector, Mr. Bright, Clerk to the Hospital Board, said there was no opposition to the scheme, and Mr. J. C. Freeman, who represented the Rural District Council, stated there was

no difference of opinion on the subject between the two authorities represented on the Board. Mr Bright explained that the Joint Board was formed in 1901, and the district comprised the borough of Maldon and eighteen parishes of the rural district of Maldon. The Board consisted of nine elected members—five chosen by the Rural District Council and four by the Town Council, the chairman of the former and the Mayor of Maldon being ex-officio members. The Board's expenditure was divided into five-ninths on behalf of the Rural District Council and four-ninths on behalf of the urban authority. The total population of the Joint Board's district was 14,794, and the rateable value 42,880*l*. The site of the proposed hospital was situated in Broad Street Green, Heybridge, and contained about three acres. Details of the estimate were as follows:—Administrative block, 650*l*; ward blocks, for ten beds, 1,357*l*; laundry and disinfecting buildings, &c., 350*l*; well and pump, 200*l*; drainage, 200*l*; fencing and making-up drives, paths, &c., 50*l*; fencing and gates, 263*l*; disinfectory, 150*l*; ambulance, 70*l*; furniture, 150*l*; laundry fittings, 30*l*; site, 300*l*; architect and clerk of works, 285*l*; legal expenses, 150*l*; contingencies, 50*l*. Those figures came to 245*l*. less than the amount they asked permission to borrow. It was stated that the Joint Board had resolved that the site should not be used for smallpox cases, and they had agreed to purchase another site for a smallpox hospital for another 200*l*. Mr. P. M. Beaumont, the architect, then explained the plans, and at the conclusion of the inquiry the inspector viewed the site.

### PUBLIC WORKS IN ROME.

THE building crisis, by which the Italian capital was afflicted for so many years, caused during the past, says Mr. Consul Morgan, a partial suspension of some of the public works connected with the so-called Piano Regolatore, which is an official scheme for the carrying out of sundry necessary public works, such as the opening of new thoroughfares, construction of the Tiber embankment, building of several new bridges across the river, polyclinic hospital, courts of justice and sundry other works. Some of them, such as the embankment and the bridges across the Tiber, as well as various new thoroughfares, were duly completed; but the polyclinic hospital and the courts of justice, as well as the national monument to King Victor Emmanuel, had to wait for better times, which seem to have come at last, as work has lately been resumed with

vigour. While the inhabitants of Milan, Turin and Florence contribute an average of 30 lire (1*l.* 4*s.*) a year, those of Rome pay 52 lire (2*l.* 1*s.* 8*d.*). One of the sources of municipal revenue is the so-called Tassa di Famiglia (family tax). This tax gave rise in the past to disputes between the municipal authorities and foreigners residing in Rome, many of whom claimed exemption on the ground of their foreign nationality. The regulations dealing with the family tax do not acknowledge such a privilege, as they hold that every inhabitant of Rome, whether he be an Italian or a foreigner, is liable to contribute his or her quota to meet the expenditure for municipal public services. A great many residents unfortunately forget that there are such things in Rome as taxes on servants, carriages, horses, dogs, &c., with the result that fines and endless trouble are incurred. They will find it cheaper to comply with local regulations.

The electric railway from Rome to Naples has given rise to interminable technical discussions; but, judging from the large number of firms who have applied for the concession, the scheme of linking two important centres like Rome and Naples by means of an electric railway seems not only to be feasible but worth undertaking. There is a large traffic of passengers and goods between the two towns. The intermediate villages will also greatly benefit, and it is foreseen that rapidity of communication and possible lower freights will attract to Rome a larger supply of foodstuffs from Naples. As the bulk of fish which is sold here is imported, an improvement may also be expected in that direction, as well as in the vegetable market. Passengers landing at Naples on their way to Rome would save three hours by taking the electric train.

The railway company that runs the trains from the capital to its suburbs, such as to Frascati, Marino, Porto d'Anzio, &c., have submitted to Government a scheme for the electric transformation of their plant. The building of several independent stations for these electric suburban lines is included in the scheme, and proposals have also been made to utilise the electric trams in Rome for the conveyance of passengers to the stations. By this means people may live cheaply out of Rome and come here daily to attend to their business, much in the same way as in London. It is estimated that the said scheme will involve an expenditure of 240,000*l.*

Another important projected railway line is the Central Umbria, connecting several large towns, such as Perugia, which is in one of the richest agricultural districts in the neighbourhood of Rome, with Terni, the seat of the chief iron

and steel works in Italy. The new line will open a large tract of country, whose supplies have up to the present had to be conveyed to the consuming centres by road. The scheme for this railway has met with great public favour, and as Government and the various municipalities concerned intend subsidising the line, there is every hope of its soon being built and opened to the public.

The need of direct communication between Civitavecchia, which is the outport of Rome and the inland central districts, has suggested the idea of a railway line from the coast to Orte. The Government and the various municipal authorities interested in the matter have promised to contribute yearly subsidies to its construction. British exporters of coal and pig and other iron, for the Terni works, will benefit by the new line, as there will be a direct conveyance of goods from the Civitavecchia pier inland.

The commendable ambition of those who are interested in the welfare of Rome, which is mainly directed towards the transformation of this hitherto consuming centre into a productive one, is gradually and steadily taking a more tangible form. Government, provincial and municipal aid is not lacking towards that end, and hopes are entertained that Rome may at an early date be able to vie in point of industry and commerce with her more prosperous northern sisters, Milan, Genoa and Turin. A few years ago the Italian capital was entirely dependent upon other districts for almost all her supplies, but with an increasing population, which has now reached about 500,000, and with the reviving general economic conditions of Italy, the old city was bound to take rank with other European capitals. Visitors who have not been in Rome for the last twenty years can scarcely recognise it. Suburbs have risen over the vineyards outside the city walls, old quarters have been superseded by large and commodious buildings; the Tiber is permanently embedded all along its urban course between two gigantic embankments on which fine houses, overlooking the river, have been constructed; solid granite bridges, meant to defy the ravages of time and the impetus of the once dangerous Tiber, have been thrown across the two embankments; new and wide thoroughfares have been opened; in one word the city has been completely modernised and rendered in all respects quite sanitary, as shown by the returns of mortality. These facts, coupled with the traditional courtesy of its inhabitants, render Rome a most agreeable and healthy sojourn. Extensive excavations have been lately undertaken by Government, especially in the area of the

## THE INTERNATIONAL COMMITTEE OF STREET HYGIENE.

CONVENED by the chairman, Mr. H. Alfred Roechling, the International Committee of Street Hygiene met at Brussels on September 21 to 23 last, to arrange for the next International Congress of Hygiene and Demography to be held in Brussels in September of next year.

This committee, which was appointed by the last International Congress at Paris in 1900, and confirmed by the Belgian Government, consists of seventeen members representing England, America, Belgium, Holland, France, Switzerland, Germany, Austria, Hungary, Italy, Russia, Poland, Sweden and Norway, and is charged with the study of all questions relating to street hygiene.

As it became necessary to clearly define the scope of the committee's work, to adopt if possible general rules to guide sanitary or local authorities when dealing with important questions relating to the cleansing of towns, and to prepare the report for next year's Congress, the committee was convened, and met at Brussels as already mentioned, in the Salle d'Hygiène in the Belgian Ministry of Agriculture, which the Minister had kindly placed at its disposal.

Besides the Chairman, the following members were present at the Conference:—Lieut.-Col. E. von Kontkowski, Russia; Professor Dr. Pagliani, Italy; Mr. Van der Perk, Holland; Professor Putzeys, Belgium; Mr. E. Putzeys, chief engineer of Brussels.

In two lengthy sittings the committee discussed the material prepared by the Chairman, and adopted with some alterations the propositions submitted by him, which will in due course be laid before the next Congress of Hygiene and Demography.

The rest of the Conference was taken up with visits of inspection to some of the works belonging to the city authorities, such as the works belonging to the street cleansing department, the sewerage works, the waterworks, swimming baths and morgue. During these visits the construction and maintenance of the streets were likewise examined, and another feature of considerable interest was the laying of the conduit

system of electric traction near the Gare du Nord. On the Quai de la Voirie the members saw a fine refuse destructor of twenty-four cells that has just been erected by the Horsfall Engineering Company, and their best thanks are due to Professor Putzeys, Mr. E. Putzeys, the chief engineer of Brussels, and Mr. Alph Smeyers, the chief of the cleansing department of the city, who did all in their power to bring about the great success of the meeting.

## VENTILATION OF COTTON FACTORIES.\*

IN connection with the manufacture of cotton, in which Manchester is so largely interested, the dust difficulty is not absent, and has a large amount of intelligent attention bestowed on it. In the various departments of the industry prior to weaving, dust does not give much trouble, for the workpeople employed in them have ample cubic space, rising sometimes in mule spinning to 10,000, but in the blowing-room and in the card-room there are considerable amounts of cotton dust. But it is in the weaving-shed that dust has been most obtrusive, and has in combination with impurities due to respiration and combustion, excessive humidity and high temperature, proved hurtful to health. The excessive admixture of size with the yarn involves the emission, during the process of weaving, of dust and flocculent matter. Size consists of starch, china clay, tallow and various deliquescent salts, the principal one being magnesium chloride. The readiness with which these constituents diffuse themselves through the atmosphere varies considerably, so the composition of the dust as explained by Dr. Dupré is by no means constant, but roughly speaking, 50 per cent. of the dried dust is insoluble mineral matter (china clay), 30 per cent. insoluble organic matter (cotton), 15 per cent. soluble organic matter (starch), and 5 per cent. soluble mineral matter (chloride and sulphate of magnesium).

The amount of dust in the shed is determined partly by the amount of size used and the quality of the cotton, and partly by the character of the ventilation and the moisture of the air. The infusion of steam largely reduces the amount of dust, but that is still present to an undesirable degree and must bear some part of the blame of the high mortality of cotton operatives from respiratory diseases. Amongst textile opera-

tives cotton workers are the most unhealthy, their mortality figure from all causes being higher than that of occupied males generally by from 20 to 23 per cent, while from diseases of the respiratory system, exclusive of phthisis, their mortality is in excess by proportions varying from 53 to 65 per cent. Dr. Tatham tells us that "the workers in cotton mills suffer severely from the presence in the air of 'air' and 'flue' that escapes from the cotton, especially in the preparation of yarn," and he also comments on the mischief done to the air passages by the particles of size.

In dealing with cotton dust and with industrial dust generally the one universal and potent remedy is of course ventilation. In contending with certain special kinds of dust special appliances and arrangements are necessary, but for dust as a whole our aim should be to intercept and remove it at its point of origin and to insure a bounteous supply of fresh air, and many contrivances for this purpose, more or less efficient, are already in use. I might review the methods of ventilation now in vogue in factories and workshops and summarise the innumerable experiments in ventilation that have been tried, but in view of the fact that we are daily expecting a report from a thoroughly competent committee of experts appointed by the Home Office, that has been investigating the subject for the last two years, it would be presumptuous in me to do so. That committee was charged to inquire into the means of ventilation in factories and workshops, with special reference to the use of fans and the use and construction of respirators for the protection of workpeople exposed to dust or dangerous fumes, and there can be no doubt that its report will contain authoritative deliverances on these points. What is wanted is a code of precise definite instructions to be placed in the hands of a manufacturer who is required to provide fans, indicating the number, pattern, size, speed and position of the fans which will most effectively and economically secure the desired result, together with directions as to the number and position of openings into the outer air, and also a judgment on the physiological effects of existing respirators and proposals for the construction of one more convenient and trustworthy and less cumbersome than any yet known. It is to be hoped that the report will embody a clear statement of the scientific principles that underlie all ventilation, and will set forth for the guidance of inspectors in terms of carbonic acid, movement of air, amount and nature of fumes, dust or spray and hygrometric state, the conditions in which artificial ventilation is called for and the methods by which it may be made to co-operate with natural ventilation

and not to interfere with it. I trust also that the report will offer suggestions to architects for the construction of factories for many of these are now so built as to render impossible ventilation which should be a primary consideration in their erection.

We may look forward, I think, to this report for a practical solution of the industrial dust problem, and the action which must be taken upon it will, we may confidently anticipate greatly reduce the death rate amongst many different classes of operatives, improve their health and augment their productive power. For improved ventilation in factories must be profitable to employers as well as to workpeople. The regulation of 1898 incorporated in the Factory and Workshop Act of 1901, setting up a standard of nine volumes of carbonic acid for every 10,000 volumes of air, has already, we are told, worked a complete revolution in the atmosphere of a considerable number of weaving-sheds, and has had a remarkably beneficial effect on the people working in them. "One effect of the greater purity of air," says Mr. W. Williams, inspector of cotton cloth factories, "is especially marked in summer when under the old conditions the impurity of the atmosphere coupled with the high temperatures reached in weaving-sheds led to frequent cases of faintness amongst the weavers. In well-ventilated sheds such cases have almost, if not quite disappeared. Further evidence in the same direction is furnished," Mr. Williams goes on, "by managers, many of whom testify to the improved health and increased vigour of workers. Some of the operatives in one shed, in which the ventilation had been much improved, volunteered the statement that they were less fatigued after a full day's work than they previously were in the middle of the day, and in other cases managers have remarked that the freshness of the weavers has increased with the freshness of the atmosphere in the sheds." One leading manufacturer, replying to inquiries by Mr. Williams, writes:—"The effect of the improved ventilation on the health of the workers has been good. We have had less staying away through sickness than before we had artificial humidity and ventilation in our sheds. The earnings have been more regular, but we do not find that they have increased as much as we expected, but the effect of the change has been advantageous to the manufacturer, the quality of the work being better and more perfect."

What more convincing testimony can there be to the hygienic and economical value of improved ventilation in relation to industrial dust?

## THE WEEK.

IT is easy for those who did not examine the designs in connection with the Liverpool Cathedral to find fault with the recommendations of the advisers, Mr. NORMAN SHAW and Mr. G. F. BODLEY. Out of consideration for the competitors the committee did not insist on the preparation of special designs for the building. But by their kindly action they opened the door to the entrance of many immature projects. According to the advisory architects, "One competitor sent a single plan, rather suggestive of the Albert Hall, the entire area being closely seated. In his report he said he had never built any buildings, and that he had been unable to prepare a design, as he had been ill. Another competitor submitted a large chalk drawing of a figure; a third, two photos of a brass lectern, and so on. There were many similar and many designs equally little to the point. We do not for a moment suggest that a man who can draw the figure could not design a cathedral, but we think the committee would desire to have stronger 'evidence of skill' in the direction of the work they required done. And when, for example, we placed the two photographs of the brass lectern in juxtaposition with thirteen large and carefully matured drawings of a cathedral, showing fine architectural skill and great knowledge in every line, we contend that we were right in our view that these threw far more light on the question to be decided than the lectern did." The advisers now say that they did not direct their attention to competitors who had prepared a special design and gave little care to the other drawings. The names and addresses of those competing were carefully concealed, and the designs were known by the numbers only. Messrs. AUSTIN & PALEY did not send in special designs, but the drawings of other churches by them were declared to be well designed and accepted as strong and decisive evidences of skill. Experience shows it is almost an impossibility to give general satisfaction in the selection of competition drawings. In the Liverpool case some surprise undoubtedly followed the announcement, but when it is said that the five sets of drawings show their designers to be capable men having considerable knowledge of old work, great care in design, and originality of a sound, practical nature, it is only fair to assume that the judges were competent and impartial.

THE changes which have taken place in recent times in Hungary are suggested by an incident which has recently occurred. A memorial of the legendary hero TŰHÜTŰM was subscribed for, and has been erected. The sculptor, JOHANN FADRUSZ, cut the inscription on the pedestal in the ancient Rune characters which were used more or less up to two centuries ago. The forms he selected for the letters were, however, derived from a manuscript which scholars consider to be a forgery. It has, moreover, been ascertained that the most exact Rune letters are illegible to the majority of the inhabitants. The sculptor was able to discover an old peasant who professes to be in a position to give models for the letters which could not be disputed, but he had to own that he knew only three people like himself who would be competent to read his inscription. In Hungary the Austrian language, or German, is superseding the tongues of the Slovaks, Croats, Wendians and others. The attempt to restore antiquity in an inscription is on that account a failure.

ONE of the bridges across the Seine leading to Notre-Dame is known as the Pont au Double. It received its name because the toll which had to be paid for crossing it was a "double," or two deniers. The old bridge was removed in 1848 and replaced by one which was not restricted to foot passengers. An approach to the bridge on the south side is known as the Rue Fouarre, which dates from 1202, and is closely connected with the history of education in Paris. At first it was known as the Rue des Escoliers. But in those primitive days the luxury of benches was unknown in the Quartier Latin. A student who did not care to be seated on the cold and muddy

earth was obliged to bring a bundle of straw every day. As he would not care to carry it back he cast it into the street. Straw was so abundant that the street was called Feurre or Fouarre, which was the old French word for straw, and it has preserved the name until our time. The great DANTE resided in the street in 1309, but whether he was compelled to carry as well as to peruse the straw is uncertain. The building in which DANTE listened to academic lectures was of the meanest; the rain came through the roof and the snow through the windows. Sometimes it was found to be preferable to deliver the lectures in the open air. The Rue Fouarre is mentioned by PETRARCH and RABELAIS. At night it was barred at both ends. In 1487 a chapel was erected in it, which existed until 1780. The privations which had to be endured by the students were not confined to the Quartier Latin. In most parts of Paris the elementary and other schools were commonly allowed to fall into a dilapidated state. The improvement in school building is to be credited to the Jesuits. Subsequently NAPOLEON ordered the erection of schools, but he did not believe it necessary that playgrounds should be attached to them. Under the Republican Government vast improvements have been introduced in schools, and those in Paris will bear comparison with any found elsewhere.

RARELY does a year pass without an announcement relating to DANTE'S house in Florence. It is, in fact, doubtful whether the modest building in a narrow lane was really the abode of the poet or of the ALIGHIERI family. There is more certainty about a house in Verona which one of the poet's descendants, who was an interpreter of VITRUVIUS, possessed. However, the Society for the Protection of Ancient Florence have petitioned the Communal Council of the city, and it is expected that the building will not only be purchased but restored. The building which has survived may be only part of the original mansion, and in it are two rooms which appear to be ancient. From some of the details it is assumed they belong to the thirteenth century. DANTE seems to have left Florence about 1313, and during the remaining eight years of his life he was either wandering about Italy or residing in Ravenna. In 1316 he might have returned provided that he asked pardon for his offences against the State. His great poem was never entirely published during his lifetime. As there was scarcely a city in Italy which he had not upbraided, if what he said were known it would not have been easy for him to find a refuge. According to GABRIELE ROSSETTI, the poet was a member of a secret society resembling modern freemasonry, and the Divine Comedy had therefore a meaning for the initiated. It would be fitting for DANTE'S residence to be public property, but if the affection of the Florentines is to take the form of a rejuvenated building it would be better for the house to remain as it is.

AT a recent convention of the American Society of Municipal Improvements it was pointed out that although the traffic in Paris, London, Berlin and other European cities was in excess of that in the busiest American thoroughfares, yet the pavements in Europe often outwore those of American streets. This was said to be due almost entirely to the manner of laying the material and of maintaining it. In the European cities the damaging effects of water were more carefully considered, and the insertion in specifications for city pavements of a clause providing for water absorption and damage tests was advocated. The results of tests showing the percentages of absorption of different paving materials, such as brick, trap rock, wood, asphalt, granite, &c., were exhibited, and the amounts ranged from 0.85 to 30.10 per cent., stones showing the least and untreated wood the greatest degree of absorption. The main cause of the difference arises from the control under which American engineers are obliged to work. They have, in the first place, to make a show of economy in order to sustain the reputation of the authorities who happen to hold office. They are also forced to utilise materials, regardless of their absorptive power, in order to favour contractors. In all such cases there is little use in contrasting American and English cities. The utmost that can be done is to draw comparisons with other American cities where similar practices prevail.

PAINTERS' ARCHITECTURE: PAUL VERONESE.

19701

## WATER-COLOUR SKETCHES AND STUDIES.

THE class of works known as "Impressionist" cannot be said to have gained the appreciation of English amateurs. The neglect probably arose from a belief that they were quickly produced. As they did not embody as much labour as the works which were familiar, people were likely to be chary about expending money on them. The principle, however, was accepted in other forms. Lyric poems, for instance, were admired in proportion as they were supposed to express momentary emotions. Impromptus in music were applauded. In the most important debates of the House of Commons a speech which was inspired by something accidental or unexpected was often more effective than an elaborated oration. In all those cases there is an assumption of a motive force within the composer, poet or orator which is restrained with difficulty, and can on the least opening become overwhelming.

In spite of objections, Impressionism is in that atmosphere which all true artists inhale. They have no longer any desire to pose as mysterious creators. The processes in all arts have been revealed, and everyone can employ them. It is known, for instance, that nature, although at one time supposed to be a hindrance to creation, has not lost her power of inspiration, and an artist's sketches can now be considered as testimonies of his reverence for the great monitor who can suit her lessons to all moods of men.

The majority of the seven hundred sketches by members of the Royal Institute of Painters in Water-Colours which are now on view are of the landscape class. The subjects are varied. It is needless to say that in many cases individuality seems to control fidelity of representation. Wherever they draw some members see opportunities for mannerism and turn them to account. Others try to resist the influence which long practice exercises on the faculties, and endeavour to suggest the peculiarities of a scene without adapting it to the customary ideal. Each little group, whether of eight or twenty drawings, will therefore repay examination, and indeed a longer time should be spent in the rooms than suffices for the ordinary exhibitions.

The hangers have placed Mr. CAFFIERI's drawings in the first place numerically. They are studies of waves and rocks, mussel gatherers and shrimpers. The figures, which recall old chromo-lithographs, are evidently French, and the "silvery" and "rose-tinted" shores are from the east side of the channel. The drawings are pleasing, for the sea in all appears in good-humour. Mr. AUMONIER has not renounced Sussex, although several of his drawings are taken from Norfolk. They have all the same strong handling, although at times it leads to spottiness. A *Wind-Blown Tree* is as characteristic as any of them. Mr. JOHN SCOTT utilises the costume of days when there were jesters and ladies who admired falcons. The drawings are elaborated, and the only reason for treating them as sketches or studies is their cheapness. We suppose all Mr. MACIVER GRIERSON's contributions are taken from the west coast of Ireland, for nowhere else in Europe is there such merciless employment of women as is represented in the *Harrow*. Two are dragging a primitive implement amidst difficulties which would test the vigour of oxen. The misery of the peasants' houses over which, as

TOM MOORE said, "two thousand years have rolled in vain," are also suggested. The *Liverpool Packet*, a steamer lying beside a quay, is the only object which is not suggestive of poverty. Mr. W. LANGLEY has only two drawings, and of course they are derived from Newlyn. Mr. R. B. NESBIT ranges from the North of Scotland to Venice with uniform success. The *Mussel Gatherers* is remarkable for the mystery which overcasts the scene and which is to be attributed to the effect of the clouds. Mr. H. J. STOCK's three drawings suffer from their neighbours. He has attempted scenes from the Book of Revelation. But BLAKE himself would not have ventured to illustrate the texts selected by Mr. STOCK. The contrast between Apocalyptic scenes and the delightful studies of chrysanthemums, wild roses, rose berries by Mrs. DUFFIELD, and the little folks by Miss DEALY, is almost enough to suggest the limits of the province of art. It is to be feared that many will prefer the humorous Dutch scenes of Mr. TOM BROWNE. It is no wonder the British are fleeced in Holland for we laugh a little too much at the inhabitants, and must pay the penalty. Mr. G. S. FERIER has also tried his hand on a Dutch windmill, but his English scenes are preferable.

Mr. HOBSON is versatile. His head of a girl might have been painted on ivory; his landscapes and seascapes are no less refined in treatment. Mr. E. G. WARREN has an admirable drawing of *The Incoming Tide*. His scenes in South Devon and Sussex are painstaking almost to excess. Mr. YEEND KING brings together a sea-view, the familiar Ramsgate Harbour, mountains as in Fehrleiten, a rustic bridge, an old red-brick house discovered on the Salisbury Road which merits attention, and other works. Hardly two are suggestive of the same hand. No one will be hypercritical with Sir JOHN TENNIEL's *Don Quixote*, although it is more suggestive of a portrait of some politician than of La Mancha's cavalier. There is no figure in the room so firmly drawn. It is sometimes difficult to decide whether the frames and mounts were not first prepared and the drawings adapted to them. Mr. MEYERHEIM's drawings are so lightly touched, they almost seem to merge into the materials enclosing them.

This time Mr. ARTHUR SEVERN restricts himself to Venice. He represents atmospheric effects as well as buildings. Santa Maria della Salute is shown under evening light, as well as on a showery day. One of the most interesting views is the *Evening Sunlight on San Giorgio*. The *Fishing-boat* is accurate enough, but it is a subject that requires air and surroundings. Mr. E. H. FAHEY's sketches have a peculiar air of completeness, as if nature had provided examples of landscape on a small scale instead of parts to be worked up. The two views of Hyères and the Berkshire scenes are especially worth attention. Mr. GORDON BROWNE's practised fingers have presented new and ingenious interpretations of the familiar rhymes about the *Bells of London Town*, such as "Oranges and lemons, say the bells of St. Clement's"—and a higher aim is revealed in his *Cassandra*. Mr. W. W. COLLINS has found excellent subjects which permit of warm colour at Rothenburg. Mr. HARRY HINE has been no less successful at St. Albans. Mr. DUDLEY HARDY of late has displayed how much can be done with single figures. His crowded *Press Gang and Return*, a vigorous drawing of people

on a quay watching a vessel, will therefore excite surprise. The humour of *Division of Spoil*, French sportsmen settling accounts in public, is irresistible. Altogether there is no lack of variety or skill. Mr. KINSLEY has a couple of views of Salisbury Cathedral among his collection. To Mr. JOSEPH KNIGHT the earth must always present a saddened aspect, and the small drawings are as characteristic of his style as those on a larger scale. There are no less simplicity and breadth and no less indifference to land in a cultivated state. Mr. J. S. CROMPTON shows monks and scenes in Cairo in his studies.

Mr. F. DADD has dispensed with highwaymen. His *Corinthian* is of a harder and more selfish type than PIERCE EGAN's hero, and contrasts with the burly *Bold Dragoon*, who is of the eighteenth century. Mr. JOHN WHITE once more utilises the West of England, and the views of Dartmoor are all expressive. The designs for the costume of players in "Paolo and Francesca" and "If I were King," by Mr. PERCY MACQUOID, have the definiteness which is desirable in such work. Mr. E. HAYES is always breezy and effective whatever may be the size of his seascapes. Mr. FINNEMORE has also drawn upon Holland for figures, and they are treated without any exaggeration. Mr. F. G. COTMAN avoids sameness, and his dozen of sketches vary as much in lighting and atmosphere as in aspect. The light-handedness of Mr. SAINTON is again exemplified in seven drawings. The *Solitary Firs* is more weird than one would expect, but the *Summer Melody*, *Evening* and *Wood Nymphs* have his customary grace of line, and it is to be hoped time will be gracious towards them. Mr. RHEAM has a vigorous study for the *Fugitive*, a princess hiding from mail-clad soldiers, besides views of the inexhaustible Cornwall. The colour system of Mr. J. R. REID is strongly marked in his sketches, and nature has to succumb to it. The coast scenes are like reductions of larger works. *A Gleam from the West*, by Mr. PEDDER, is an important work in which the effect of lighting on a hillside and a lake are contrasted successfully. Mr. FULLEYLOVE's industry is remarkable. He has no less than eighteen drawings, and they are mainly architectural. Several foreign countries besides England have supplied the subjects. The most elaborate is the *Great Avenue, Hampton-Court*. The artist is indifferent how often the subjects have been represented, for he contrives to emphasise some feature which imparts novelty to the view. Mr. CHARLES DIXON also is not afraid to attack London scenes. The view from the Hôtel Cecil, *Billingsgate*, *On the Embankment*, are remarkable. But is not the display of strange colours in the *Dispersal of the Fleet* in August last rather imaginative than historical?

Mr. BERNARD EVANS's bold transcripts are always welcome additions to the gallery. There is, no doubt, an apparent relationship between his English and foreign scenes, but few would care to cavil over the shortcomings of so strong an assimilative power. Mr. EDGAR BUNDY is another of the Institute's favourites. His humour rarely becomes extravagant. *A Sermon Perforce*, where the comfortable and secure parson holds forth from behind his garden wall to the culprit in the stocks, is more than a pictorial incident, for it is a satire on official but unsympathetic advisers of all kinds. Mr. G. C. HAITE's drawings reveal improvement in style. The President has drawn a girl in a *Vista of Teens*, and has condescended to allow her to be handsome. In *Before the Sitting*, a lady or model reading a paper, there is a surprising suggestion of reality besides absence of pose. Mr. CLAUDE HAYES has several views in which the large expanse of sky first claims notice. Mr. T. R. MACQUOID is one of the veterans of art, and he is as careful in details as if he were endeavouring to secure admission to a gallery for the first time. At one period he was supposed to be restricted to architecture, but he *Spring Evening after Rain*, *Tooting*, the *Burst of Spring*, the *Barber* and the *Beggar* and other works, denote his capability in figure and landscape. Many other drawings are to be seen, and, indeed, amateurs in quest of cheap and excellent works will find in the Institute Gallery an affluence of them, while students of water-colour art can derive many lessons from the walls.

A Statue of Voltaire is to be erected in Madrid, and the sculptor selected is M. Benelliure.

### THE ENCYCLOPÆDIA BRITANNICA.\*

THE sixth of the new volumes of the Encyclopædia Britannica abounds in biographical notices. Several painters are among the subjects, but by a remarkable coincidence neither architects (with the exception of Mr. JAMES KNOWLES) nor sculptors have any representatives among the names which begin with "K," "L" or "M," and form a series commencing with CHARLES KEENE and ending with WILLIAM MORRIS.

KEENE, it may be mentioned, after being articled to a solicitor, sought more congenial work in an architect's office, and while there he practised water-colour drawing in his spare hours. Afterwards he became an apprentice of a firm of wood-engravers. In December 1851 one of his designs appeared in *Punch*. His inventive power was not equal to his skill in representation, but Fortune is sometimes kind, and having become acquainted with Mr. JOSEPH CRAWHALL, "who had been in the habit for many years of jotting down any humorous incidents he might hear of or observe, illustrating them at leisure for his own amusement, these were placed unreservedly at KEENE's disposal, and to their inspiration we owe at least 250 of his most successful drawings." It is extraordinary how much success was attained by KEENE without any regular art training. His few etchings were as remarkable as his drawings on wood or for process blocks. According to M. BRACQUEMOND, "by the freedom, the largeness of their drawing and execution, these plates must be classed amongst modern etchings of the first rank." The reputation of CECIL LAWSON as a painter is restricted, but there are grounds for saying that he "restored to English landscape the tradition of GAINSBOROUGH, CROME and CONSTABLE, infused with an imaginative intensity of his own." His *August Moon*, now at the Tate Gallery, is enough to suggest the power of a man who died in his thirtieth year. The sketches of LEIGHTON and MILLAIS were written by the late Mr. MONKHOUSE, a ponderous official who was not capable to do more than repeat in a verbose manner the conclusions of earlier critics which had become commonplace. The stereotyped adjectives are occasionally varied by such fine phrases as "fresh little flowers of leisure" to signify sketches. Mr. WAUGH's article on WILLIAM MORRIS mainly relates to the poetic works. The position of the designer is expressed as follows:—

Essentially the child of the Gothic Revival he had put an ineffaceable stamp on Victorian ornament and design, his place being that of a follower of Ruskin and Pugin, but with a greater practical influence than either. In house decoration of all kinds, furniture, wall-papers and hangings (which he preferred to paper), carpet weaving and the painting of glass and tiles, needlework, tapestry, he formed a school which was dominated by his protest against commercialism and his assertion of the necessity for natural decoration and pure colour, produced by handwork and inspired by a passion for beauty irrespective of cheapness or quickness of manufacture.

All MORRIS's protests are now better understood. He was fortunate in being able to obtain extraordinary prices for his productions, and he was wise to keep to a market which he found to be profitable. But there was as much "commercialism" in his transactions as in those of the traders from whom he professed to disassociate himself. What he clearly lacked, says Mr. WAUGH, in life, no less than in art, was a direct and sincere sympathy with ordinary humanity. If he possessed that quality he would have appreciated the efforts of manufacturers and others who endeavoured to impart beauty to objects which had to be cheap. If MORRIS produced a piece of cotton he would demand as much for a yard as a trader would charge for a piece. The qualities of ALBERT MOORE, the figure-painter, who in any other country would have had his time monopolised by public works, are suggestively described by Mr. BALDRY in the following words:—

The main idea that governed Albert Moore's practice was a deliberate and intentional disregard of dramatic subject. In

\* The new volumes of the *Encyclopædia Britannica*, constituting in combination with the existing volumes of the ninth edition the tenth edition of that work, and also supplying a new, distinctive and independent library of reference dealing with recent events and developments. The sixth of the new volumes, being volume xxx. of the complete work. (Published by the *Times*, London.)

all his pictures, save two or three produced in his later boyhood, he avoided any approach to story-telling, and occupied himself exclusively with decorative arrangements of lines and colour masses. The spirit of his art is essentially Classic, and his work shows plainly that he was deeply influenced by study of antique sculpture; but he was not in any sense an archaeological painter, nor did he attempt reconstructions of the life of past centuries. Artistically he lived in a world of his own creation, a place peopled with robust types of humanity of Greek mould, and gay with bright-coloured draperies and brilliant-hued flowers. As an executant he was careful and certain; he drew finely, and his colour sense was remarkable for its refinement and subtle appreciation. Few men have equalled him as a painter of draperies, and still fewer have approached his ability in the application of decorative principles to pictorial art.

It will be regretted hereafter that works on a large scale by ALBERT MOORE are not to be seen. His decorative arrangements were generally of a small size. The Queen's Theatre in Long Acre, which was adorned by a frieze, has been demolished, and his paintings in churches are difficult to find. His brother, HENRY MOORE, R.A., was mainly known by his sea-pieces, which were always of an intense blue. There are also articles on the foreign artists, LENBACH (who was trained to be a builder), MANET, MARIS, MEISSONIER, MENZEL, MONET and MOREAU, and illustrations are given of their works and also of the English painters.

A revolution in connoisseurship was produced by the investigations of GIOVANNI MORELLI, who is the subject of an article. When he was elected to the Italian Parliament he obtained a commission to control the works of art which were declared to be public property, and he was appointed president. He soon found that much which was accepted as historical was on an uncertain basis. As he did not wish to wound Italian susceptibility he expressed his doubts in a German periodical under the name of IVAN LERMOLIEFF. Controversy arose about his conclusions, but as they were grounded on scientific principles instead of the vague opinions of experts, the victory was in most cases on his side. It was not agreeable, however, to have to abandon the belief that the *Magdalen* of CORREGGIO in the Dresden Gallery was in reality the work of a Dutchman, and that if judged by treatment of details in regular order, many other accepted masterpieces would not sustain a test. A disciple, Sir A. H. LAYARD, is also commemorated in the volume, but his claims to renown rest on his explorations in Assyria, of which the sculpture from Nineveh in the British Museum is the best memorial. It is needless to say many other articles are to be found which readers in general are likely to consider as more important than the biographies of artists.

Professor CASE treats of logic and metaphysics in their modern developments. It may to some appear remarkable that in the latter so decided a representative of physical science as WREN should be introduced. But MACH, who upheld a theory of "universal physical phenomenology" not unlike HUME's, claimed to have the support of NEWTON's third law of motion, "action and reaction are equal and contrary," which was derived from experiments by WREN, although the whole credit of the discovery is usually given to NEWTON. The law can be tested by observation of the senses, but in metaphysics there is no use for that power. Action and reaction, in common with all other phenomena, may be delusions. Professor CASE can see no future for metaphysics except by going back to the study of ARISTOTLE. TENNYSON believed that no one has yet succeeded in defining metaphysics, and before returning to the Stagirite it would be well to have a clear idea of what we expect him to supply.

The article on Libraries bristles with figures. As usually happens in the writings of officials, there is not a word which can be turned to account by architects. Yet librarians are loudest in complaining about the least shortcomings in the buildings they control. After so many conferences it was to be expected that some indications of the desirable arrangements would be forthcoming. Several other articles will bear analysis, such as those on Labour Legislation, Landlord and Tenant, Land Registration, Lighthouses, Metalwork, Miniatures. The prefatory essay is by Mr. A. BIRRELL, K.C., the subject being "Modern Conditions of Literary Production." The taste of the

English public in literature is suggested by one sentence:—"That very risible farce, 'Charley's Aunt,' has made more money than is represented by the united fortunes of SCOTT, THACKERAY and DICKENS." It is also stated that the authoress of "East Lynne" or her publishers might have drawn at least 50,000*l.* from Transatlantic readers if copyright had been arranged with the States.

The volume upholds the reputation gained by its predecessors as the most successful effort to popularise all varieties of knowledge in their latest state.

## BARKING AND EAST HAM.\*

IN old records the name of Barking is found as Breeching Bereking, Berkyng, &c.; now it is almost universally spelt Barking. Morant derives the name from the Saxon words Beorce and ing, signifying a meadow planted with birch trees, but other antiquaries are of opinion that it is derived from Burgh-ing—the fortification in the meadow. This latter explanation seems to be borne out by the fact that an "encampment" is still to be traced of the most extensive dimensions—being more than 48 acres in extent—on the north side of the town.

Barking, as was usually the case with parishes in which large monastic houses stood, was very extensive, being nearly 30 miles round, reaching up to the borders of Hainault Forest, on the north side of Chelmsford Road, and including the hamlets of Ilford, Chadwell, Aldborough Hatch and Barking Side. But most of these have been cut off and made into separate ecclesiastical districts. The advowson belongs to All Souls College, Oxford, to which it was given by William Pownset, of Loxford, who had been steward to the abbess.

Barking is in the Hundred of Brecontree, nearly eight miles from London, and is bounded by Eastham, Little Ilford, Wanstead, Woodford, Chigwell and Dagenham, in Essex, and by Woolwich, in Kent, a great part of the marshlands belonging to the last-named parish lying on the Essex side of the river. The parish contains 7,850 acres of cultivated land, of which about 1,980 are marsh land, about 300 cropped with potatoes, 250 upland meadow, &c. The soil is various—clay, gravel and loam.

In 1616 Samuel and John Jones had a grant from the Crown of the market-place at Barking, with the market-house built by Queen Elizabeth.

The small river Roding, which rises in the north part of the county near Elsinham, runs along the western boundary of the parish till it falls into the Thames. It is navigable as far as Ilford. In the fields adjoining to a farm called Uphall the circumference is to be traced of an entrenchment 1,792 yards in extent (*i.e.* 1 mile 32 yards).

Mr. Lethiullier thinks this entrenchment was too large to be that round a camp; his opinion therefore is that it was the site of a Roman town.

### Barking Abbey.

Barking Abbey, dedicated to the Virgin Mary, is said to have been the first monastery for women established in this kingdom. It was founded about 670 (in the reign of Sebbi and Sighere, kings of the East Saxons) by St. Erkenwald, Bishop of London, in compliance with the earnest desire of his sister Ethelburgha, who was appointed the first abbess.

The founder was the first bishop who sat in the see of London after the building of St. Paul's Church by King Ethelbert.

The charter of Hodelred, father of King Sebbi, is coeval with the foundation of the abbey, and undoubtedly genuine, and is still extant among the Cottonian manuscripts in the British Museum, and is one of the most ancient records of that nature.

In 870 the monastery was burnt to the ground by the Danes, and the nuns either slain or dispersed. It was rebuilt by King Edgar. In the abbey gateway, which we have seen, and which is a portion of the old abbey, although, of course (as may be seen), it has been restored, is a very ancient picture of the Crucifixion. The place was called the "Chapel of the Holy Rood Loft atte Gate;" now it is styled the "Fire Bell Gate" from a tradition that it contained the bell rung for curfew and for alarm of fires.

At the Conquest it (the abbey) was a place of note, having had several royal ladies for abbesses, and the Conqueror is said to have visited the place on his way to take up his abode at the Tower of London. From the gate of Barking Abbey also William is said by historians to have set out on his first royal progress through his newly-conquered kingdom.

\* A paper read by Mr. T. H. Alexander before the members, of the Upper Norwood Athenaeum.

The library of Magdalen College, Oxford, possesses a relic of the abbey in the shape of a beautiful French manuscript containing the Lamentations of St. Bernard, the Meditations of St. Augustine and a Life of St. Louis, presented to the convent by the Countess of Oxford, the wife of the twelfth earl of the old line of De Vere.

Amongst the privileges of the Abbess of Barking was permission to keep dogs for hunting hares and foxes in Essex. In those days ladies who took the veil, instead of immuring themselves in the cloister, often led a jolly, open-air existence, many of them becoming ardent sportswomen. One of the first treatises on hunting, hawking and fishing was written by Julia de Berners, prioress of Sopewell, near St. Albans, "a gentlewoman endowed with great gifts of body and mind." This Julia de Berners may frequently have been asked over to Barking by the abbess for a run with the "abbey hounds." On occasions when the fox took a southerly course they would cross the "two hides" belonging to the Abbot of Westminster. The abbot might, at the time, have been engaged in the pastime of hawking amidst the wild-fowl which haunted the river marshes. Apologies would be made to him, a few compliments would doubtless pass, and then, after exchanging notes with regard to the day's sport, the ladies would ride on.

The later history of Barking Abbey is somewhat uneventful. In 1376, owing to a breach in the river wall on the left bank of the Thames at Dagenham, a short distance east of Barking Creek, the abbey was flooded. The inundations recurred in 1380 and 1382, but, at considerable expense to the convent, works were at length undertaken which removed any further fear of trouble from this cause.

At the dissolution of the monasteries in 1539 the abbey surrendered to the Crown, and the demesne lands were leased by Henry VIII. to Sir Thomas Denny.

On the list of abbesses is to be found the name of Mary à Becket, sister of the Archbishop of Canterbury, and among illustrious personages who have resided there may be mentioned Eleanor, widow of the murdered Duke of Gloucester. When Catherine de la Pole, daughter of the Earl of Suffolk, was abbess, Edmund, Earl of Richmond (father of Henry VII.), and Jasper, Earl of Pembroke, sons of Owen Tudor by Catherine, the Queen-Dowager, were educated in the abbey.

Lysons gives a ground plan of the Abbey Church, Barking, taken from the ruins of the foundation in 1724, from a drawing in the possession of Mr. Ed. Hulse. Length, east to west, 170 feet; length of cross aisle, north to south, 150 feet; choir, 50 feet; width of church and nave, 22 feet; width side aisle, 11 feet; width cross aisle, 28 feet; diameter of bases of columns, 8½ feet; space between the columns, 22 feet.

#### *Barking Church.*

The parish church was dedicated to St. Margaret. In the chancel are two figures (in brass) of priests. The inscriptions have been removed. The church is large, comprising a nave, chancel and north and south aisles, with a tower at the west end. It was built chiefly in the fourteenth century, but its date is not at all clearly shown by its architecture, the tracery of its windows having been superseded by modern insertions. One portion of the church, including the piers between the nave and the north aisle near the eastern end, is Norman, and there are traces of Early English and Perpendicular work. It contains some fine monuments; the best and finest is in memory of Sir Charles Montagu, 1625, of Cranbrook, Essex (brother of the first Earl of Manchester), who is represented as dying on the field of battle, a page holding his horse at the door of a tent.

In the church were three chantries: one at the altar of the resurrection, in the north transept, and others at the altar of King Edward and the shrine of St. Ethelburgha.

It appears that the vicars of Barking were considered as part of the household of the lady abbess, and had a seat and a wife and fork (if forks were then invented) at the chaplain's table, their servants sitting "below the salt" with the domestics of the convent, but this right being found troublesome, because, as a document of 1536 explains, "the vicar, being the execution of his office among his parishioners, according to his bounden duty in that behalf, could not always repair to the monastery at the time appointed for meals or refectations, by reason whereof he was often disappointed of his meals; and that it was tedious and sumptuous for the abbess and convent to cause meals, drinks and other substances to be prepared at such extraordinary times and seasons as they should be driven by necessity to demand the same," it was therefore agreed that the vicar should be allowed 10*l.* a year to get his meals elsewhere. Even allowing for the greater purchasing power of money at that period, a fraction over sixpence a day seems a small sum to provide a vicar and his servant with both food and drink.

There are also among the monuments in this church one to Sir Crisp Gascoyne, Lord Mayor of London, who died in 1761. He is an ancestor, on the maternal side, of the present Marquis of Salisbury, much of whose property in the neigh-

bourhood is inherited through him. There is another to William Pownset, 1553. The signature of Captain Cook, the navigator, who married Miss Bates, of Barking, on December 24, 1762, may be seen in the register of marriages. Against the church wall outside is to be seen the following quaint inscription over a tomb:—

Stay here awhile, and his sad loss deplore,  
Here lyes the body of one Thomas More,  
His name was More, but now it may be said  
He is no more, because that now he's dead,  
And in this place doth lye sepulchered.

At the east end of the north aisle in the church is the tomb of Mauritius, made Bishop of London 1087. The parish register begins in 1558. There is a Quakers' meeting in Barking, and Mrs. Elizabeth Fry, of prison celebrity, is interred in the burying-ground.

Sir Christopher Hatton lived at Clayhall; he was cousin and at length heir to Sir Christopher Hatton, Lord Keeper of the Great Seal to Queen Elizabeth. There is an entry in the parish register, April 24, 1708, "Buried the Queen of the Gipsies."

#### *Greenstreet House.*

Greenstreet House, East Ham, commonly called "Anne Boleyn's Castle," now known as St. Edward's Catholic schools, is a large red brick mansion, supposed to be the site of the seat of the Nevills, whose tomb we have seen in East Ham Church. The most conspicuous feature of the building is a tower, called locally Anne Boleyn's Tower, from a tradition that that unhappy lady was confined in it. There are many legends connected with Anne Boleyn lingering about this fine old house. One is that the tower was built for her by her royal lover in the days of his courtship. The tale is told by an old writer that "Anne Boleyn was betrothed to a young nobleman, who died. About ten months after his death the king demanded her hand. She, as was the custom, requested to be allowed to complete the twelve months of mourning for her lover, to which Henry agreed, and for her amusement built the tower in question, from which she had a fine view of the Thames from Greenwich to below Gravesend." Lysons attributes no credit to the traditions of Anne Boleyn having been confined in this tower, as he thinks that it is evidently of more modern date.

That some one of wealth once possessed it, however, is proved by the fact that the room in the third storey was originally lined with leather inlaid with gold. A Mr. Morley, who lived in the house at the beginning of the nineteenth century, says that, according to a history of England which he had read, Henry VIII., on his suspicions being aroused with regard to her, had Queen Anne confined in the same tower in which five years previously he had courted her. From here she was taken by water down Ham Creek—which ran almost to the house—to Greenwich, and thence to the Tower of London.

In further support of the local tradition, Mr. Morley assured the writer of an article in the *Gentleman's Magazine* that he had himself seen a letter in the handwriting of King Henry VIII. dated from Greenstreet. Greenstreet House remained in Mr. Morley's family till 1863, when it was bought by Cardinal Manning and devoted to its present purpose.

#### *East Ham Church.*

Mr. J. T. Micklethwaite, in making a report upon this church some years ago, says:—"The churches near London have generally been so much altered and enlarged and rebuilt . . . to meet the requirements of an always growing population, that it was a surprise to find one of them still substantially in the form in which it was built over seven centuries ago. It has never been enlarged. No changes seem to have been made during the later Middle Ages, and comparatively few in more modern times. A church may have stood on this site from the earliest days of English Christianity, but the present one is very likely the first stone building. It was built about the middle of the twelfth century, and consisted of a nave without aisles, a rather large chancel, and a round-ended presbytery. All these are of one building, although the eastern parts were done first, as was the custom. There is some evidence of an intention to carry up the chancel as a tower, as was done at Newhaven, in Sussex, and elsewhere; but it was given up. . . . The work is good, and the wall arcades of the chancel and the arch towards the tower show more ornament than is generally found in country churches of the twelfth century, although the chancel arch and south doorway, the parts in which ornament is oftenest found, have in this case been destroyed. Early in the thirteenth century the south side of the presbytery was rebuilt in order to obtain a larger window above and a piscina and priest's door below. This position of the priest's door is uncommon. None seems to have been provided at the first building of the church. The south porch, which is now used as a vestry, is of wood,

and perhaps of the fifteenth century; but it is so covered up with plaster inside and out that it is impossible to speak with certainty about it.

"A special feature in the church is the early painting, traces of which remain in all parts. The walls generally have been blocked out with red lines, with scrollwork at the tops of the walls and on the soffit of the presbytery arch; and figures, some of them larger than life, on the wall-spaces between the original windows. . . . There is a little old painted glass. . . . There is a good marble font, dated 1639, which has been moved from its original place.

"In considering what should be done to the church, we have to think how we may preserve its historical record, which in this case happens to be an unusually interesting one; and also how to fit it for the decent performance of the Church's services."

Behind the communion table is a handsome monument to the memory of Edmund Nevill (styled Earl of Westmorland). There is a brass on the floor of Elizabeth, wife of Rd. Heigham. The earliest date in the register of baptisms, &c., is 1695.

The Rev. Dr. Stukeley, the antiquary, who was born at Holbeach, Lincolnshire, 1687, was buried here; but his grave cannot be recognised, as he directed that the turf should be made smooth over it. The register gives the date of his burial in the year 1765, on March 9. Among other subjects upon which he wrote is a treatise on "Gout."

At Great Ilford there was a leper hospital, founded by Adeliza, abbess of Barking. By the rules there was provision for thirteen lepers, and if one died another was elected to fill the vacancy. It was purchased of the Waldrons in 1739 by Crisp Gascoyne, alderman of London, the grandfather of Bamber Gascoyne.

Local tradition connects Eastbury House with the Gunpowder Plot. The usual underground passage is supposed to connect the house with Barking Abbey, to which it once belonged.

There also resided in this neighbourhood one John Fowke, who in the year 1686 bequeathed certain estates for the maintenance of eight boys in Christ's Hospital, two of them to be of this parish.

The whole district is fraught with interest, but in a paper suitable to the present occasion it is impossible to touch upon everything. I hope, however, that I have compassed sufficient to show how interesting the subject is, and in compiling this account of the places visited, &c., I must acknowledge my indebtedness, among other authorities, very much to "Lysons's Environs of London," published in 1796.

### THE ERECHTHEUM.

AN illustrated article on the Erechtheum, the most beautiful of the Ionic temples, appears in the *Architectural Record* of New York for October. It is by Mr. Edwards Gale. The following extract will serve to suggest the character of the description:—

Aside from the pleasure derived from a study of the portions of the Erechtheum as they are now found, exhibiting as they do the most varied, the most perfect and most beautiful architectural forms and decoration to be found in any single structure of antiquity, it is necessary to consider some of the main characteristics of the present structure in connection with its past.

An examination of the fragments of the west wall, which stood above the base course still remaining, proves that the fallen portion of the wall is of about the fourth century A.D., so that the wall as in general seen by Stuart and others, and as portrayed by them, is probably a reconstruction which took place when the temple was converted into a church. The Athenian inscription mentions no windows, and the attached columns which are referred to are those of which the bases remain, which are of the original workmanship. Judging from traces on the wall and from the manner in which the string-courses are cut off square, and the channel in the antæ, it is apparent that some structure was originally built against that portion of the wall, and the arrangement and traces of the steps indicate two levels at that end, probably a small court or garden.

Considering the general condition of the south wall, it appears especially fortunate that, as some part had to suffer, it should have been chiefly the expanse of plain wall rather than the Portico of the Caryatides. From many indications, the chief of which are that the stones of this portico are merely let into the main wall of the temple, and except one stone of the west side form no integral part of it, a method quite contrary to usual Greek work, it is believed that this portico was not part of the original design, but was the immediate substitute of some more simple structure, yet of a date nearly or quite corresponding to the rest of the work.

Of the six caryatides, five remain in their original position. The second one from the south-west corner, removed by Lord Elgin and sent to England in 1812, and later acquired by the British Museum, is now replaced by a copy in terra-cotta. The inner caryatid on the east side of the portico is the one that was missing at the time of Stuart's visit, but it was later set up, and somewhat restored.

These figures, being substitutes for columns, were treated with great simplicity, the posture being varied only in that the three figures to the west rest on the right and the others on the left leg.

That the position of the hands and arms may have slightly differed is probable, but unfortunately none now remain whole, all being broken somewhat above the elbow. Although the faces are marred and the long tresses which fell on the shoulders are broken, the beautiful contour of the head, with the masses of hair drawn back from the brow, leads with a gentle blending to the capital which intervenes between the figure and its great burden. The folds of the diploidion concentrated in depth of shadow between the breasts give an effect of strength on a central axis, and below the drapery falls directly to the base, giving a powerful vertical quality in the lines. These figures are classed with the best sculptures, but there are parts executed with much less exactness than would have been found during the height of Pheidias' purity. The cornice over the caryatides, fairly preserved in parts, is badly worn away at the top, and excepting a small fragment on the north-west end, the upper cymatium, carved in egg and dart and interspersed with lions' heads, traces of which are discernible, is entirely gone. A large section of the flat panelled ceiling has fallen. The entrance to the portico is a small opening cut through the podium; the level of the floor inside being a trifle higher than the upper step, a short steep-stairway, traces of which remain, led down to the door giving access to the western section of the temple.

On the north side of the Erechtheum the level is about 10 feet lower than on the south; the portico on this side, the most perfect work imaginable, so long used by the Turks as a magazine for military stores, was finally freed from the screen-walls in 1846.

It is here that the effect of the high Greek steps becomes very apparent. That the steps were proportioned for architectural purposes and not for ease of ascent is certain, and by them the lines of the cornice are admirably counterbalanced and the effect of the columns greatly increased. No curve such as exists in the Parthenon has been observed in these steps. The intercolumniation of this portico is the widest allowed to stone temples, a peculiarity being that the central interval is less than the outer. In connection with the difference of spacing in the columns of this and the eastern portico the vast difference in the proportion of the columns themselves should be noticed. The entasis of the columns of the northern portico is one of the most delicate curves ever applied to a structural form. The axes of the columns are not perpendicular, but incline inwards at a uniform angle, and the corner columns, as in other Greek temples of the best period, have a slightly greater diameter than the others. The capitals of these columns form the most beautiful example of decorated Ionic capitals found in Greece; although all are now somewhat destroyed sufficient remains to show their perfection in form and detail. Beside the spirals of the volute runs a deep square sinkage, from which metal fastenings or traces of them show in every capital; and it is more than probable that these square sunk spirals were filled with strips of bronze and that the central eye contained a rosette of the same metal. It will be noticed that over the egg and dart the circles of the platted band are cut very deep. These were filled with coloured stones. The columns although much defaced are standing entire, except the one at the north-west angle; the upper part of its capital and a fragment of the volute are on a stone near the portico, and a small portion of its necking is in the museum on the Acropolis. Much of the entablature that is not in position lies scattered about on the ground near the portico, and many of the best examples of the carved ornament may there be examined. The plain frieze is of dark Eleusinian stone, and the remaining fragments show numerous sinkages and metal dowels irregularly placed to support the figured frieze. The figures supported by these metals were sculptured in white marble. All the fragments now remaining are in the museum on the Acropolis, and consist of only forty-eight small and broken pieces.

Amongst the fallen masses near the portico is a stone which appears to have formed the central block of the tympana. The angle is  $14^{\circ} 5' 6''$ . All but a small fragment of the inclined corona and cymatium is missing. This fragment may be seen in the museum on the Acropolis. Its workmanship is very fine, but the piece unfortunately small.

The flat ceiling of this portico was mostly destroyed by the siege of 1826, but one entire section remains in place; many of the minor parts are scattered about on the adjoining ground. The plain mouldings show traces of colour, and the centre of

each panel appears to have been filled with a bronze ornament. The only painting used on the exterior of the Erechtheum appears on the ceilings of the porticoes—a decorated egg and dart on the plain mouldings and a Greek fret on the flat soffit outlined between the lines of beading.

The great doorway of the northern portico, although mutilated and somewhat reconstructed by the insertion of jamb linings, still shows its extraordinary beauty of proportion and detail. The small plain doorway near it originally led to the enclosed court on the west side of the Erechtheum. Below the pavement of this portico may be seen the rock struck by Poseidon.

Of the six columns of the eastern portico, five remain in position, the other one being in the British Museum, having been sent to England in 1812 by Lord Elgin. The ceiling and entablature is much more damaged than on the north, and the detail is simpler and not always so perfect. The stones forming the pediments at the east and west ends appear to have been destroyed. That the pediments were nearly completed in 409 B.C. is shown by the Athenian inscription. Marble roof tiles and acroteria have been found in considerable quantity, but, although some are of exceptional form, the workmanship does not indicate that they are contemporary with the original work of the Erechtheum.

### GLASGOW TECHNICAL COLLEGE.

THE opening meeting of the session of the Architectural Craftsmen's Society was recently held. The presidential address was delivered by Mr. C. Ernest Monro. At the outset, reference was made to the progress and work of the Society since its institution. Thereafter he proceeded to read a paper entitled "Materials: some Misuses and Limitations." The "lamp of truth" was strongly emphasised, and the importance of practical knowledge of the nature and capabilities of materials with regard to their individual uses and adaptabilities for express purposes and treatment in construction. A vote of thanks was accorded the lecturer, and attention was called to the conditions of prize offered by Mr. P. Macgregor Chalmers, architect, for the best essay on the subject of "New Buildings in Glasgow and their Methods of Construction." During the session papers will be read on "Art as a Teacher," "The New Teaching Regulations," "Early French Renaissance Architecture," "Roof Tiling," "Fireproof Construction," "The Minute Structure and Methods of Distinguishing the Species of Woods," "Ironmongery," "Construction of Timber Staircases," "Leaded and Stained Glasswork," "Planning and Construction of Burgh Buildings," "The Glasgow Mode of Measurement."

### LUXULYAN CHURCH.

THE parish church of Luxulyan now possesses, through the liberality of Mr. Silvanus Trevail, a peal of six bells. Three have been recast and three added. Messrs. Gillett & Johnston were the founders. No. 1 (treble), note F, is 26 inches in diameter and weighs 3 cwt. 3 qrs. 21 lb., and is inscribed:—"These bells were recast, rehung, and three added at the expense of Silvanus Trevail, F.R.I.B.A., in honour of his parents, John and Jane Trevail, of Carne, in this parish, A.D. 1902." No. 2 bell, note E, is 27 inches in diameter and weighs 3 cwt. 3 qrs. 14 lb., and bears the names of R. Sinclair Kendall, vicar; Colman B. Rashleigh, Bart., and Samuel Edwards, churchwardens, A.D. 1902. No. 3 bell, note D, is 28½ inches in diameter and weighs 4 cwt. 1 qr. 10 lb. It is inscribed:—"DE. 1722 I C. VIC. TP. WR. May God bless this parish and its people. A.D. 1902." No. 4 bell, note C, is 30½ inches in diameter, weighs 5 cwt. 0 qr. 21 lb.; inscription:—"R.G. n 1666. On earth peace, goodwill towards men." No. 5 bell, note B, is 34 inches in diameter, weighs 7 cwt. 1 qr. 14 lb., and is inscribed:—"1684. I was recast in the year when H.M. King Edward VII. was crowned. God bless the King, A.D. 1902." No. 6 bell, tenor, note A, is 37 inches in diameter, and is inscribed:—"John Cole, vicar; Philip Harris, John Harris, W. Pennington. 1764. Vivos Voco: Mortuos Plango: Pulgura Frango. A.D. 1902."

Mr. Trevail has also erected a churchyard cross in the style of the old Cornish Celtic crosses of the ninth and the tenth centuries. Cornish granite is used and the design, in which Rev. W. Iago, of Bodmin, gave assistance, is based on that of the six best examples in Cornwall, namely, St. Neot, Cardinham, St. Mabyn, Lanivet, St. Columb and Padstow. It was executed by Messrs. John Evans & Son, of Bodmin.

The following address was presented to Mr. Trevail on the occasion of the dedication:—

"On this the dedication day of your munificent gift to your old parish church of the enlarged and reconstituted peal of bells, a day when again from the tower 'sounds aerial seem to float,' will you allow the parishioners of Luxulyan to most

heartily thank you. The name of Trevail has been associated with the parish of Luxulyan for so many generations that nothing is needed to perpetuate it in our midst, but in accepting the bells at your hands we have done so as a solemn trust, as strengthening the tie of associations with the giver, and chiefly because we recognise the good effect which will be induced by the sweet sounds of our church bells, not only on our own minds, but also on those of generations yet unborn.—R. S. Kendall, vicar; Colman B. Rashleigh, Bart., Saml. Edwards, churchwardens, on behalf of the parishioners of Luxulyan."

### MUNICIPAL BUILDINGS, ST. IVES.

THE property and plans committee of St. Ives Town Council have considered the letter from Mr. E. Hain, M.P., offering to present to the town a site near the parish church for the erection of municipal buildings. The borough surveyor has prepared a plan showing the available space for the erection of a block of buildings to contain guildhall, council chamber, jury rooms, public hall, town clerk's, surveyor's and treasurer's offices, muniment-room, parochial offices, mayor's parlour and fire brigade station and office, and the Council have decided to submit the same to Mr. Hain for suggestions or approval; to instruct the town clerk to obtain from boroughs recently provided with municipal buildings particulars of such buildings and the cost of them; to advertise for a set of competitive plans and specifications for the block of buildings, to cost about 6,000*l.*, and to offer premiums of 70*l.* to the architect whose plans and specifications are accepted, and 30*l.* to the architect whose plans and specifications are considered by the committee next in order of merit.

### STEEL WITH CONCRETE.

IN a recent communication to the Paris Académie des Sciences M. Considère describes a series of valuable experiments carried out by a commission appointed by the Ministre des Travaux Publics with a view to ascertaining the precise rôle played by the metal in ferro-concrete constructions. According to an abstract of the report in *Engineering* the specimens tested by the commission were generally 6'56 feet long, and had a cross-section 3'94 inches square. Each of these concrete bars was reinforced at the corners by four steel rods, having a total section of 1'77 square inches. The concrete employed was made by mixing 661 lbs. of Portland cement with 1'04 cubic yards of gravel, passing a '98-inch screen, and '52 cubic yard of sand, passing a '19-inch screen. It was found that in setting the contraction of the concrete gave rise to an initial compression in the steel reinforcement amounting to 2'86 tons per square inch of the metal. The corresponding tensile forces simultaneously called forth on the concrete amounted to 74 lbs. per square inch. Tested in tension it was found that the specimens stretched rapidly until the stress on the concrete was practically equal to the ordinary tensile strength of this material. From this point the tested bar stretched much less rapidly, and throughout this period the tensile stresses in the concrete remained constant, the whole increase of load being taken by the iron bars. It follows therefore that during this period the elastic modulus of the concrete was zero. In one case the test-bar was subjected to a stress of 292 pounds per square inch of cross-section, under which the total extension of the specimen was '024 inch. The reinforcing rods were then cut out, and the + - shaped bar left was then tested in cross-breaking, and, in spite of being somewhat injured in the cutting out of the reinforcing bars, only failed under a calculated stress of 128 pounds per square inch. Summing up, M. Considère states that concrete-steel submitted to tension acts precisely as ordinary concrete, so long as the tensile stress does not exceed the usual breaking stress of ordinary concrete. Under higher stresses it will support without breaking extensions which, in the case of specimens hardened under water, have been as great as 1-500th the total length, and in the case of air-hardened concrete have ranged between 1-2000th and 1-850th of the total length. When the concrete-steel is stretched beyond the usual elastic range of ordinary concrete, the tensile stress on the concrete remains constant up to the ultimate breaking-point, the whole of the additional load being taken up by the metal. When subjected to repeated tensile stresses, however, the fraction of the load carried by the metal tends to augment, and that of the concrete to fall, until ultimately the working stress on the concrete is only 70 per cent. of its original value. If, finally, after a series of loadings and unloadings, the maximum load is raised 30 per cent., the concrete again exerts a tensile resistance equal to its primitive value. It may be added that the modulus of elasticity in compression of a concrete-steel bar is reduced on stretching the latter.

## NOTES AND COMMENTS.

THE Board of Manufactures in Edinburgh has for a long period fostered industrial art and technical education in Scotland. At one period it was the only institution of its class in Great Britain, but one of the indirect effects produced by it has been the creation of other bodies who profess to be more vigorous and more in keeping with the modern spirit. The title, perhaps, is not sufficiently explicit, and does not express all that has been done or can be done by the Board. The Government have therefore been compelled to institute an inquiry into the position of the Board of Manufactures. The occasion has been seized by the Royal Scottish Academy to make an effort to become free of the tutelage of the Board, and it is possible there will be other imitators in the revolt. Every one who has visited Edinburgh is aware that there is a joint occupancy of the low temple-like buildings in Princes Street. The Board of Manufactures and the Academy with the National Gallery are in one. The Scottish Academicians propose that the building, instead of being jointly occupied, should be assigned to the Board of Manufactures for the paintings and other works of art known as the National Collection, while the Royal Scottish Academy should obtain possession of the Royal Institution, which is used as a museum of antiquities, a drawing school and offices for the Royal Society. At present, it must be acknowledged, the building available for the Academy is not adapted for such annual exhibitions as are desirable. The building in Trafalgar Square in its worst days was far more satisfactory. What is to become of the Society of Antiquaries and the Royal Society, both important bodies, is not clear. But they are each well capable of guarding their own interests. The Scottish people are likely to see grounds for the changes; but when the Academicians insist that they should be emancipated from the duty of teaching, there is sure to be general disapproval. The purpose of academies of art throughout Europe comprised teaching. We need only refer to the English practice. The academies which preceded our Royal Academy, and were independent of support from the State, recognised the necessity of teaching, and it might be said that teaching formed the basis of the institution founded by GEORGE III. The Royal Hibernian Academy, although always in a state of poverty, does not neglect attention to students, and the Scottish Academy has also rendered services in that way, although of late years the instruction has been grudgingly given. If the artists will not do something in return for the possession of a Government building, why should it be made over to them for the glorification of the members?

THE destruction of the Hôtel de Ville in Paris was so complete, there are very few relics left of the splendour which gave *éclat* to the interior of BOCCADOR's building. The most important reminder is to be found in the Château de La Punta in Ajaccio. It is a sculptured representation of the four seasons under the appearance of four children. They are placed near a globe which is surrounded by signs of the Zodiac and sustained by four dolphins. The group is the work of DEBAY, the sculptor, and belonged to a fountain which was placed under the escalier of the Cour Louis XIV. DEBAY's name is almost forgotten, but forty years ago he held an important position among French artists, and his amorini especially were judged worthy of admiration. It is remarkable that his work should have escaped the flames of the Communists. The group found its way to a marble-worker in Paris, who restored it, and it was afterwards sold to a Corsican gentleman.

WHEN the excessive tariff on works of art entering the United States from Europe was first imposed, it was intended to serve the interests of American artists. So long as it was thought to be fashionable to have a gallery filled with examples of modern French paintings, for they were chiefly in favour, native art was never likely to flourish. Americans might study in Paris and set up ateliers, but there would be no improvement in the system of patronage. French artists, finding that people began to hesitate more and more about paying 20 per cent. on the value of their pictures, have got over the obstacle by taking occasional visits to New York, Chicago and other places, where they execute works which bring in high prices. The

number of French paintings which are found in Chicago is incredible. Even at the hotels valuable foreign pictures and statues are to be seen. The American artists now find there are two sides to the account. They have secured temporary protection, but the works of old masters, which it would be an advantage to study, are withheld from them. When they learn that purchasers like Mr. PIERPONT MORGAN retain their costly acquisitions (the estimated value is 6,000,000*l.*) in England on account of the tariff, and are lending them for exhibition to London and the provinces, they can realise at length that all is not gold which glitters. The mere fact that works of art are classed with mechanical productions by Custom-house officials must also have an injurious effect by inducing men to look on them as no more than a variety of manufacture. If the artists could exercise control, the tariff would be suspended or materially altered.

AN International Engineering, Machinery, Hardware and Allied Trades Exhibition will be held at the Crystal Palace in the spring of next year. It will have the benefit of the patronage of Lord KELVIN and many other important personages connected with engineering and allied trades. There is every indication that the exhibition will be a success. The general manager is Mr. HENRY GILLMAN, who has had much experience in similar enterprises. Among the sections are sanitation and ventilation, electrical engineering, woodworking, art metalwork, heating and lighting, builders' ironmongery, marble and enamelled slate, tiles, safes and strong-rooms, oils, paints and colours, architectural ironwork, furniture, &c. The Crystal Palace is well adapted for exhibitions of the kind.

THE courses of lectures in the Ecole des Beaux-Arts, Paris, began on the 16th inst. The following are the courses and professors:—Ornament, M. D'ESPOUX; Mathematics, Dr. BOURLET; Descriptive Geometry, M. PILLET; Stereotomy, M. MARCEL LAMBERT; Physics, Chemistry and Geology, Dr. RIBAU; Construction, M. MONDUIT; Perspective, M. JULIEN; Building Law, M. MULLET; History of Architecture, M. MAGNE; History of French Architecture during the Middle Ages and Renaissance, M. BÆSWILLWALD; Theory of Architecture, M. GUADET. In addition to the above special courses, there are courses of General History by Dr. LEMONNIER, and of Literature by Dr. ROCHEBLAVE, which are common to architects, painters and sculptors. All the students are also eligible to attend the courses on Design, by M. JOSEPH BLANC; Modelling, by M. ALLAR; Elementary Architecture, by M. BÉNARD; and Decorative Composition, by M. MAYEUX.

THE late Mr. STOCK's treatise on "Shoring and Underpinning" (London: B. T. BATSFORD) is destined to hold a place in architectural literature not unlike that assigned to Mr. WELLS's treatise on "Dew" in scientific literature. Although devoted to a special, and it may be a humble subject, the principles introduced are those which have the widest application. Timber construction especially is exemplified in the proportioning and arrangement of shores to resist the forces brought against them, and which lead to tensile as well as compressive strains. As a rule, old houses used to be propped by the aid of empiric rules, but the dimensions of beams can be ascertained by calculation as readily and as accurately as other parts of structures. Mr. FARROW, in preparing the third edition, has refrained from altering any considerable portion, but he has substituted the provisions of the London Building Act of 1894 for those of the Act of 1885, which were in force when Mr. STOCK lived. To a great extent the book may be accepted as a treatise on the mechanics of construction, while shores will be found far more easy to understand than the ordinary diagrams.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair.

Mr. C. H. BRODIE, in proposing the adoption of the annual report and balance-sheet of the last session, said the one fresh point brought to notice was the gratifying account of the day school.

Mr. FRANCIS HOOPER, who seconded the proposal, said in the matter of success the figures spoke for themselves. It was only necessary to point out that the increased expenditure in various details was the result of more classes. The staff work had increased in proportion, and they had therefore to be prepared to expend more money than they had done in the past. In many departments the increase was simply due to progress in their work.

The following were elected members:—Messrs. C. G. Hare, H. C. Ingram, W. Paul, A. S. W. Mackay, H. J. Scott, A. T. Groves, R. M. Butler, A. N. Prentice, S. I. Adams, W. J. Feare, S. Ford, T. W. Fullerton, R. C. Foster, H. H. Whittington, N. A. F. Haslewood, E. R. Nixey, R. Tasker, M. E. Webb, E. J. Whitley, F. E. Whiting, A. C. Withers, J. W. Waite, G. Vey, W. N. Couldrey, B. Chaikin, A. A. Hands, W. T. Temple, Alan Binning, H. Reaney, A. M. Millwood, P. O. Dunk, C. Gascoyne, S. W. Hill, J. R. Osborn, M. R. Martin, P. H. Topham, E. F. Ferry, A. E. Munby, A. Horsnall, G. F. Royds, T. C. Pope, C. M. Harris, T. S. Atlee, W. G. de M. Wilkinson, J. H. Markham, L. Cahen, C. A. S. Vardy, W. Whymper, W. K. McDermott, G. D. Clunies Ross, G. G. Sigismund, L. Morgan.

Mr. T. R. SPENCE read the following paper, entitled

## Homer and Architecture and the Crafts.

The aim of this paper is not to enter into vexed questions of archæology or the latest discoveries relating to archaic art and their relation to the life of Homer.

It is more in the nature of a fairy journey with him, noting the delicate and subtle suggestions on architecture and the crafts which interlace the expression of his joy in battle, and the lovely sea and land in which is set the story of his characters. He was the seer who "dipped into the future and saw the wonder that would be," for, we may take it, the art he described was more in the sense of a vision of its fruition. He gave in literature what Phidias gave in marble and metals. May not archaic work be the strenuous childhood of effort to materialise the conception of the seer? and only when Phidias came did his ideas reach their permanent ripeness and fulfilment.

How well he has suggested in the Odyssey a broad conception of architecture in speaking of shadowy halls, echoing galleries and fragrant chambers and the value of the bath. His genius seems to have indicated most of the things in architecture and its accessories which are acceptable to those who find their joy in this great art. Any discussion on Homer and architecture really embraces all that is best in Greek art, so that the subject is a vast one. It is like accepting a brief for the scheduling of all that adds to the beauty and refinement of life in architecture. Of course, I mean one phase of architecture only, and my reverence is equally great for many others of widely distinct periods of expression in form and treatment, but here we have infinitely more than will suffice for this evening. The architecture that Homer gives largely appertains to stately dwellings; it is the hope of all students that commissions for such will reach them sooner or later. Recently architecture has suffered somewhat from persistent efforts to graft on to that architecture, which should be spacious, large and dignified, such forms, shapes and dimensions as appertain to the cottage or kitchen furniture.

Homer's appreciation for the decorative details of marble, colour, metals, &c., associated with architecture, seems to run on true schemes of harmony. Their gamut is not large (probably the better for that), and consists of gold, silver, ivory and bronze, so that you feel he was familiar with the refinements of life and free from the tyranny of the commonplace. His heroes, during the delight of battle, were decked with magnificent beaten armour, ornamented in repoussé of gold and silver. Some descriptions of such are quoted later, and we only need to refer to vase paintings, &c., to see how good was the general scheme of the armour of the best Greek period. In the "Iliad" we find the first reference to architecture in a suggestive passage on Priam's palace, "adorned with polished colonnades—and in it were fifty chambers of polished stone, builded hard by one another, wherein Priam's sons slept . . . and for his daughters over against them, on the other side within the courtyard, were twelve roofed chambers of polished stone, builded hard by one another."

Hephaistos plays a great part in the arts, he being a great craftsman in metal in the house of the gods. His own dwelling is described as being imperishable, star-like, a house of bronze worked by the crooked god himself, where he forged "tripods, twenty in all, to stand round his hall, and beneath the base of each he had set golden wheels, that of their own

motion they might enter the assembly of the gods and again return unto his house, a marvel to look upon; this much were they finished that not yet were the ears of cunning work set thereon—these he was making ready and welding chains," &c.

Here follows the description of the shield of Achilles. It is carefully detailed at some length, but quite worthy of your attention, and gives with a keen insight all that goes to make magnificent subjects illustrating such incidents as embrace all those elements which are decorative. Here there is no lack of matter to fill with interest and beauty many friezes, and we know how difficult it is to find a *motif* or a subject that is really decorative in itself. "He threw bronze that weareth not in the fire and tin and precious gold and silver, and next he set on an anvil stand a great anvil and took in his hand a sturdy hammer. First fashioned he a shield great and strong, adorning it all over, and set thereon a shining rim triple, bright glancing. Five were the folds of the shield itself, and thereon he fashioned much cunning work from his wise heart. There wrought he the earth and the heavens and the sea, and the unwearied sun and the moon waxing to the full, and the signs every one wherewith the heavens are crowned: Pleiads and Hyads and Orion's might, and the Bear that men call also the Wain—her that turneth in her place and watcheth Orion, and alone hath no part in the baths of Ocean.

"Also he fashioned therein two fair cities of mortal men. In the one were espousals and marriage feasts, and beneath the blaze of torches they were leading the brides from their chambers through the city, and loud arose the bridal song. And young men were whirling in the dance, and among them flutes and viols sounded high; and the women, standing each at her door, were marvelling. But the folk were gathered in the assembly palace, for there a strife was arisen, two men striving about the blood price of a man slain, and both were fain to receive arbitrament; and the folk were cheering both as they took part on either side. And heralds kept order among the folk, while the elders on polished stones were sitting in the sacred circle, and holding in their hands staves from the loud-voiced heralds. Then before the people they rose up and gave judgment each in turn. And in the midst lay two talents of gold, to be given unto him who should plead among them most righteously.

"But around the other city were two armies in siege with glittering arms. And two counsels found favour among them, either to sack the town or to share all with the townsfolk even whatsoever substance the fair city held within. On the wall there stood to guard it their dear wives and infant children, and with these the old men; but the rest went forth, and their leaders were Ares and Pallas Athene, both wrought in gold, and golden was the vesture they had on. Goodly and great were they in their armour, even as gods, far seen around, and the folk at their feet were smaller. And when they came where it seemed good to them to lay ambush, in a river bed where there was a common watering-place of herds, there they set them, clad in glittering bronze. And two scouts were posted by them afar off to spy the coming of flocks and of oxen with crooked horns. And presently came the cattle, and with them two herdsmen, playing on pipes; they took no thought of the guile. Then the others, when they beheld these, ran upon them and quickly cut off the herds of oxen and fair flocks of white sheep, and slew the shepherds withal. But the besiegers, as they sat before the speech-places and heard much din among the oxen, mounted forthwith behind their high-stepping horses, and came up with speed. Then they arrayed their battle, and fought beside the river banks, and smote one another with bronze-shod spears, and among them mingled Strife and Tumult, and fell Death, grasping one man alive fresh wounded, another without wound, and dragging another dead through the mêlée by the feet. Like living mortals, they held together and fought, and hurled the corpses each of the other's slain.

"Furthermore, he set in the shield a soft, fresh-ploughed field, rich tilth and wide, the third time ploughed, and many ploughers therein drave their yokes to and fro as they wheeled about. Whosoever they came to the boundary of the field and turned, then would a man come to each and give into his hands a goblet of sweet wine, while others would be turning back along the furrows fain to reach the boundary of the deep tilth. And the field grew black behind and seemed as it were a-ploughing, albeit of gold, for this was the great marvel of the work.

"Furthermore, he set therein the demesne-land of a king, where hinds were reaping with sharp sickles in their hands some armfuls along the swathe were falling in rows to the earth, whilst others, the sheaf-binders, were binding in twisted bands of straw. Three sheaf-binders stood over them, while behind, boys gathering corn and bearing it in their arms gave it constantly to the binders; and among them the king in silence was standing at the swathe with his staff, rejoicing in his heart, and henchmen apart beneath an oak were making ready a feast and preparing a great ox they had sacrificed, while the women were strewing much white barley to be a supper for the hinds.

"Also he set therein a vineyard teeming plenteously with clusters, wrought fair in gold; black were the grapes, but the vines hung throughout on silver poles; and around it he ran a ditch of cyanus, and round that a fence of tin; and one single pathway led to it, whereby the vintagers might go when they should gather the vintage. And maidens and striplings in childish glee bare the sweet fruit in plaited baskets. And in the midst of them a boy made pleasant music on a clear-toned viol, and sang thereto a sweet Linos-song with delicate voice; while the rest, with feet falling together, kept time with the music and song.

"Also he wrought therein a herd of kine with upright horns, and the kine were fashioned of gold and tin, and with lowing they hurried from the byre to pasture beside a murmuring river, beside the waving reed. And herdsmen of gold were following with the kine, four of them, and nine dogs, fleet of foot, came after them. But two terrible lions among the foremost kine had seized a loud-roaring bull that bellowed mightily as they haled him, and the dogs and the young men sped after him. The lions rending the great bull's side were devouring his vitals and his black blood, while the herdsmen in vain tarred on their fleet dogs to set on, for they shrank from biting the lions, but stood hard by and barked and swerved away.

"Also the glorious lame god wrought therein a pasture in a fair glen, a great pasture of white sheep, and a steading and roofed huts and folds.

"Also did the glorious lame god devise a dancing place like unto that which Daidolos wrought for Ariadne of the lovely tresses. There were youths dancing and maidens of costly wooing, their hands upon one another's wrists. Fine linen the maidens had on, and the youths well-woven doublets faintly glistening with oil. Fair wreaths had the maidens, and the youths daggers of gold hanging from silver baldrics. And now would they run round with deft feet exceeding lightly, as when a potter sitting by his wheel that fitteth between his hands maketh trial of it whether it run; and now anon they would run in lines to meet each other. And a great company stood round the lovely dance in joy (and among them a divine minstrel was making music on his lyre).

"Also he set therein the great might of the River of Ocean around the uttermost rim of the cunningly fashioned shield.

"Now, when he had wrought the shield great and strong, then wrought he him a corslet brighter than a flame of fire, and he wrought him a massive helmet to fit his brows, goodly and graven, and set thereon a crest of gold, and he wrought him greaves of pliant tin."

In the *Odyssey* we learn more of the arts that appertain to home life and its hospitality; the provision for these things is mainly the architect's function, so that we may not pass them over. Bathing and anointing with olive-oil and sweet herbs to end all fatiguing journeys and to precede all feasts. Much was made of guests arriving from either peaceful or warlike expeditions. They were led into the hall.

"They sat down orderly on seats and high chairs, and when they were come the old man mixed well for them a bowl of sweet wine, which now in the eleventh year from the vintage the housewife opened."

When Telemachus was welcomed at the house of Menelaus by his wife we find the following:—"Helen bade her handmaids set out bedsteads beneath the gallery and fling on them fair purple blankets and spread coverlets, and thereon lay thick mantles to be a clothing over all. So they went from the hall with torch and spread the beds, and the henchmen led forth the guests. Thus they slept there on the outer gallery of the house—the hero, Telemachus, and the splendid son of Nestor."

Again, when Telemachus and his men had "tilted his chariot against the shining faces of the gateway, and led them into the hall divine, and they beheld and marvelled as they gazed through the palace, for there was a gleam, as it were, of sun or moon through the lofty palace of renowned Menelaus. But after they had gazed their fill they went to the polished baths and bathed them. Now when they had bathed and anointed them with olive oil, and cast about thick cloaks, they sat on chairs by Menelaus, and a handmaid bore water for the hands in a goodly golden ewer and poured it forth over a silver basin to wash withal, and to their side she drew a polished table and laid upon the board many dainties." When they had put from them "the desire of meat and drink," there comes a finely-expressed speech of thanks from Telemachus. To quote:—"Son of Nestor, delight of my heart, mark the flashing of bronze through the echoing halls, and the flashing of gold and of amber, and of silver and of ivory. Such like, methinks, is the court of the Olympian Zeus within, for the world of things that are here; wonder comes over me as I look thereon." A portion of the reply of Menelaus should be quoted:—"Yea, for after many a woe and wanderings manifold I brought my wealth in ships. I roamed over Cyprus and Phœnicia and Egypt, and reached the Ethiopians and Sidonians and Erebi and Libya."

Here is another passage bearing on the domestic life:—"Helen came forth from her fragrant vaulted chamber, like Artemis of the golden arrows; and with her came Adrastê and set for her the well-wrought chair, and Aleippê bare a rug of soft wool, and Phylô bare a silver basket which Alcandrê gave her, the wife of Polybus, who dwelt in Thebes of Egypt, where is the chiefest store of wealth in the houses. He gave two silver baths to Menelaus and tripods twain and ten talents of gold, and besides all his wife bestowed on Helen lovely gifts; a golden distaff did she give, and a silver basket with wheel beneath, the rims thereof were finished with gold," &c.

Other quotations follow bearing on the matter:—"Helen stood by the coffers wherein were her robes of curious needlework which she herself had wrought." Menelaus to Telemachus:—"And of the gifts such as are treasures stored in my house I will give thee goodliest and greatest of price. I will give thee a mixing-bowl beautifully wrought; it is all of silver, and the lips thereof are finished with gold—the work of Hephaestus."

Throughout the whole of Homer's writing there is evidence of a close acquaintance with the treasures of art of many races, and the examples of these may have fired his imagination; but it is not my function to enter into this wide field of archaeology and conjecture. In the descriptions handed down by ancient writers of the work of Phidias and his pupils, there is the great statue of Zeus, with which no other artist can compete, a statue of large proportions carved in gold and ivory, seated on a throne holding in his right hand a figure of victory and a sceptre, capped with an eagle in his flight. His garment was covered with low-relief sculpture of figures and lilies. On the throne and footstool were mythological conceptions worked in relief and colour. The rests for the footstool were lions in gold. The head of the god was not passionate or distorted in expression, but calm, majestic and godlike; and through the whole work of figure, throne and canopy was that rare sense of refinement and impressive distinction in design which should stamp a supreme piece of art. Then there was the great statue of Athene on the Acropolis, and the incomparable frieze; but his supreme position and works in the world are too well known for me to take up your time in enumeration, uniting, as it does, all that is perfect in craftsmanship and dignity of design. Many quotations might be given from the *Odyssey*, but probably the following will suffice as bearing on architecture:—

"Meanwhile, Odysseus went to the famous palace of Alcinoüs, and his heart was full of many thoughts as he stood there, or ever he had reached the threshold of bronze, for there was a gleam, as it were, of sun or moon through the high-roofed hall of great-hearted Alcinoüs. Brazen were the walls which ran this way and that from the threshold to the inmost chamber, and round them was a frieze of blue, and golden were the doors that closed in the good house. Silver were the door-posts that were set on the brazen threshold, and silver the lintel thereupon, and the hook of the door was gold. And on either side stood golden hounds and silver . . . and within were seats arrayed against the wall this way and that from the threshold even to the inmost chamber, and thereon were spread light coverings thinly woven, the handiwork of women. . . . Yea, and there were youths fashioned in gold, standing on firm-set bases, with flaming torches in their hands, giving light through the night to the feasters in the palace. And he had fifty handmaids in the house, and some grind the yellow corn on the millstone and others weave webs and turn the yarn as they sit restless as the leaves of the tall poplar trees, and the soft oil drops off that linen, so closely is it woven. . . . And without the court hard by the door is a great garden of four plough gates, and a hedge runs round on either side, and here grow tall trees blossoming, pear trees and pomegranates and apple trees with bright fruit and sweet figs and olives in their bloom. The fruit of these trees never perisheth or faileth, winter nor summer, enduring all through the year evermore; the west wind blowing brings some fruits to birth and ripens others. Pear upon pear waxes old, and apple on apple, yea, and cluster ripens on cluster of the grape, and fig upon fig. There, too, hath he a fruitful vineyard planted, whereof the one part is being dried by the heat, a sunny plot on level ground, while other grapes are gathering, and yet others they are treading in the winepress. In the foremost row are unripe grapes that cast the blossom, and others there be that grow black to vintaging. There, too, skirting the furthest line, are all manner of garden-beds planted trimly, that are perpetually fresh, and therein are two fountains of water, whereof one scatters his streams all about the garden and the other runs over against it beneath the threshold of the courtyard and issues by the lofty house, and thence did the townsfolk draw water."

The greater part of this applies to the garden, but as many architects now include schemes for laying out gardens in their plans it should be of interest.

The following quotation may be added which bears on the reception and treatment of a guest, necessarily associated with

Domestic architecture:—"Pontonous, the henchman, set for him a high chair inlaid with silver, in the midst of the guests, leaning it against the tall pillar, and he hung the loud lyre on a pin, close above his head, and showed him how to lay his hands upon it, and close beside him he placed a basket and a fair table, and a goblet of wine by his side . . . after they had put from them the desire of meat and drink, the Muse stirred the minstrel to sing the songs of famous men."

It seems to me that the architect Ictinus and Phidias have petrified the dreams or prophecies of Homer, so that we can in a measure believe they were one in architectural design, the one finding his expression in words and the other in such material elements which embody architecture and give it a local habitation and a name.

It should be our function to gather the threads together of what makes Greek art so great, and I can only indicate some things which occur to me as evidence. These I submit with some diffidence, not being an expert or having my mind charged with a great store of knowledge of the vast field of Greek architecture.

From what I have seen in Greece, the perfection of the workmanship of every detail in the architectural remains is very patent—from the perfect arrises of fillets and flutes of the immense Doric columns, the soft and accurate curves of the volutes in the Ionic caps, the daintiness, finish and shape of the egg and tongue and other details of acanthus leafage on horizontal mouldings; the fine, sinuous uniting curves and relief of the acanthus when used in larger and detached forms; the true and delicate contours of their mouldings and the juxtaposition of larger flat curves with smaller incised and sharply-cut members; the sense of decoration they get in soft horizontal lines of shadow being picked up and accentuated by the sharp incisive darks below.

The evidence of reserve in the disposition of ornament—if their ornament was full of nice detail so was it laid on a quiet field, and thus lost none of its value. This vignetting of the sculptor's jewels is a most commendable feature in architecture.

The satisfactory way in which their bas-relief panels filled up the space they were to adorn—the subject filled the space fully and with dignity, the heads not slipping far below the top moulding. What could be better in this respect than the frieze of the Parthenon?

In their groups of ornament note, notwithstanding much small work in parts, running through are always larger curving, uniting forms so that the general effect is in no way belittled, but delicacy and breadth of expression is maintained.

Note the coins of the best period, how "largely" the heads fill the circle. How fine and dignified is the convention or design of the hair and other accessories. How the lions, the goats, the bulls have those parts accentuated which express their attributes, forerunner of the same sense as is seen in animal forms in the early heraldry of the Middle Ages. It may appear curious to cite coins in speaking of architecture, but their sense of largeness and true invention contains that which makes fine architectural ornament. Whatever may be the period or style of architecture in which it is your destiny to work, the storing of these details just mentioned in the cells of the mind should create such an innate sensitiveness to bad proportion, clumsy forms and imperfect workmanship as would form a large proportion of an architect's education.

Their candelabra are fine in contour and ornamentation of curved forms and the right distribution of mouldings, with long spaces between on the shafts.

The real Greek lyre is a fine example of design as seen on the coin. In modern times there is no poor instrument that has been so tortured away from its great prototype. The stage property-man has much to answer for in this respect.

Our incomparable British Museum is a treasure house of Greek art, and there you may note how satisfactorily many things relating to architecture are accomplished. See how the groups of sculpture in the Parthenon pediment fill the triangular space and, as you may know, this has not always been done in modern buildings with success. The high reliefs of the figures in the metopes show a fine expressive crispness suitable to their position. The frieze, which, of course, comes within the shadow, has a treatment of another kind, comparatively low in relief, yet giving a fine sense of breadth and refinement. At the first glance you think that the great purple shadows on Greek architecture are lightless, but on examination such is the quality of the iridescent light, innumerable soft reflections play on these reliefs and give them more definition and harmony. Well, in such juxtapositions where two ways of treatment are involved, the result is an added value to each form of detail. This also applies to mouldings and other forms of decoration. The architects of the Italian Renaissance have treated the ornamentation and profiles of mouldings with a charming variety and liberty. Mina da Fiesole is about the best in this way. Yet do not start from Mina da Fiesole in your efforts to add further interest to such detail; rather add your invention to the purer Greek forms.

The museum contains in the archaic-room an Ionic capital from the Temple of Ephesus, which seems to me the perfection of treatment in the volutes—so soft, yet large and truly architectural. It seems to me to be finer than those of the Erechtheum.

Note in some of the statues how broad and searchingly expressive of the contours of the figures are the draperies, yet when leading away from the figure how they are licked up into crisp and expressive lines which would show against the sky or other background (especially in those statues that are to express movement).

In the museum you will notice how architecturally that noblest of decorative animals, the horse, is treated.

It may be contended that there is not much to be learned of architecture proper from Homer, yet I venture to think that what he says of it is of significance and interest to those practising this art, for by that means they will be led to take a deep interest in the efforts of later Greek architects and artists to illustrate or build up into permanent form his imagery. The examination of their achievements will result in an education. Really, beauty is required of you on special occasions, apart from that which is scientific or constructive. You cannot give beauty to your work by a paragraph in the specification. Now the world expects of you, over and above perfect planning, construction and sanitary excellence, that crown which we name beauty and which Jules Breton has defined as "the splendour of the true."

Please do not think that your task is to reproduce only from the cells of memory the best details of the Greek or any other period; but think how much can be gathered from their sense of proportion, the value of plain spaces and the vignetting and placing of such adornments as their sculptors, painters and metal craftsmen could supply.

To me the clothing of the Greeks ranks, as costume, very high, if not the highest, as a motif for the architectural sculptor. It does not seem an invention of pushing tailors. It is of the simplest construction, and follows and accentuates all the sinuous motions of the figure. Its lines are endless in variety, and can be governed by, and made subservient to, the sculptor's aims. What perfect gems in design, craft and line are the best Tanagra figures, as you may observe in the British Museum, mostly illustrating quiet domestic incidents; but there are in the museum in Athens several examples showing remarkable and vigorous technique in the expression of the swirl of the dance.

The best Mediæval costumes bear a close relationship to those of the Greek. Then, again, the symbols of their religion, as seen in the Parthenon frieze, are of refined and decorative forms. The late Lord Leighton uses them with great effect in his picture *The Daphnephoria*, I venture to say, one of the finest decorative pictures ever painted. Although it represents another form of festival than that on the Parthenon, it always leads me to realise how great as a decoration in form and colour must have been the actual procession which Phidias illustrates. We can imagine it on its progress along the Sacred Way, winding through the shallow valleys, and anon outlined against the blue and sapphire of the Saronic Gulf and the Peloponnesian mountains.

We gather from Homer a fine sense of site for his architecture, as he mentions in his descriptions the House of Alcinous as having a fair prospect. Then, again, a later writer speaks of Athens as the "city of the violet crown," the crown being the Parthenon.

I can speak from experience of the site of the House of Agamemnon on the lower spurs of the mountains of Argos. Behind are the higher peaks and far away below stretch the plains of Argolis. As Homer phrases it, the pasture-land of horses, and beyond the boundaries of this plain lies the blue shimmering bay of Nauplia. On speaking of Greek landscape with its long, horizontal lines of blue seas and grey-green plains, from the boundaries of which rise the broad and dignified mountain forms, all bathed and united in the iridescent air of that divine land, makes it an unequalled source for instilling into an architect such a sense of colour for decorative purposes as cannot be obtained from text-books of coloured ornament.

This reference to landscape may seem a wandering away from architecture, but no source of inspiration is unworthy. Most architects have a deep interest in interior colour, but many cherish as their only idols schemes of grey-greens and reds, avoiding that which is sumptuous in colour. When you get over the wall of the Swiss Alps revelations come upon you that the diffused purple has harmonies equally beautiful. In Greece all the greens, blues and greys, &c., seem to be steeped in a bath of purple. This veil of purple iridescent atmosphere is the magic which assimilates and brings all local colour into decorative completeness. Unfortunately, we cannot bring the quality of the sunlight here, but still remembrance of these things has an educational value.

An architect's life and practice is, we know, inextricably mixed up with specifications, quantities, dilapidations, sanitary and other engineering, *et cetera*. There is no escaping the well-

known ending to specification paragraphs—the very convenient *et cetera*. Yet sometimes the opportunity comes when a fine creation is demanded of him in which all these things for the moment are of secondary importance—when, like Homer or Shakespeare, he must give to airy nothingness a local habitation. Even as seeds in the idle fallows long for the gentle rains, so will he sigh for that enthusiastic and supersensitive state of mind from which creation is won. My remarks may have been of a wandering nature, but apart from the science and ever-changing needs of architecture, it is a great and beautiful art, and to give it that crown of art or beauty, air of distinction or style—call it what you will—that subtle seal which Phidias, Bramante, Wren, the great Goths and many others have set upon their work, some little deviation in the side paths of the softer emotions cannot be a fruitless journey. Whatever may be the perfection of the anatomy of the parts of your architectural work, it can never suffer from wise and restraining disposition of its bejewelling.

Frankly a great architect must possess many gifts. He must have that which is generally known by the words common sense; it is rather a clumsy phrase which means so much, for it really embraces a subtle practical wisdom, a sense of winnowing the wheat from the chaff, and as far as architecture is concerned a thinker in building material rather than in pencil. I venture to say he must have added to these qualities the instincts of a poet to finally set that seal of completeness on his conception which makes a work of art.

Mr. JOHN SLATER, who proposed a vote of thanks to the author of the paper, said Mr. Spence had taken a line in the subject which he had not expected, and one which could draw little discussion from the architectural point of view. They must not take the descriptions of the palaces in Greek poems too literally. The bards committed the poems to memory, and then made up and inserted passages. In the descriptions of imaginary grand buildings the writers enlarged on the grandeur; they knew barbaric splendour and they also knew the more splendour they crammed into their descriptions the greater interest was taken in their narratives. The general drift of the paper had been to impress upon the minds of students the value of steeping themselves in a knowledge of Greek work. Such advice could not be laid too much to heart by lovers of architecture.

Mr. R. PHENÉ SPIERS, who seconded the motion, said the paper had suggested that it was not simply building construction that should take up the student's thoughts; there was a higher sphere, that of the poetical, which should influence his design.

Mr. J. D. CRACE supported the motion.

The CHAIRMAN, in putting the vote to the meeting, said the study of Greek architecture in England laboured under some disadvantages. It seemed necessary that in order to appreciate fully the beauty of Greek art, one must see it under its own climate.

### METROPOLITAN THEATRES.

THE theatres and music-halls committee of the London County Council have just issued a report, signed by Sir Algernon West, the chairman, on the subject of the Council's treatment of theatres under the license of the Lord Chamberlain in respect to the public safety. It appears that the Lord Chamberlain in July last stated that he understood there were certain theatres that had not yet complied fully with the requisitions made by the Council at its general inspection of the previous year, and that in the circumstances he would be glad if the Council would give instructions to have such theatres inspected, and he asked that he might be favoured with a report upon their condition. Later on his lordship forwarded to the Council a copy of a circular which he had sent to the managers of the theatres licensed by him, to the effect that he would not grant any licenses for the performance of plays in theatres until the several managers were provided with a representation in writing from the London County Council that such theatre was properly safe from the danger of fire. The Lord Chamberlain was next informed that it was impossible for the Council definitely to state that a theatre was "properly safe from the danger of fire," as a certain amount of risk in every place of amusement was bound to be incurred, however well the house be constructed. It was arranged, therefore, that the theatres should be bound to come up to the Council's standard of safety. Upon hearing from the Lord Chamberlain in August that he would require such a certificate for the coming licensing day on September 29, the officers were instructed to survey the theatres. In the short time at their disposal, however, it was impossible to complete so heavy a piece of work, and accordingly it was agreed to grant full licenses to all theatres which had been surveyed and had complied with all the requisitions, and to grant provisional licenses of three months to the remaining theatres which had either not completed the necessary works or had not yet been surveyed

by the Council's officials. In matters of this kind misapprehension might arise owing to a want of appreciation of the facts of the case, and it was with the object of informing the public that this report had been issued.

### WEATHERING OF MAGNESIAN LIMESTONE.

DURING the summer of 1899, whilst the Jermyn Street front of the Geological Museum was being renovated, the opportunity was taken of collecting several specimens of the stone to see how it had been affected by half a century of London atmosphere. The museum was erected during 1848 to 1851 from designs by Sir James Pennethorne, architect. Owing, however, to more important work having to be attended to it was not possible for the chemists of the Geological Survey to complete the examination till recently. An interesting paper has appeared recently by Mr. E. G. Clayton, F.I.C., "On an Incrustation from the Stone Gallery of St. Paul's Cathedral." This paper is of great interest in connection with Portland stone in London atmosphere. The report on the selection of stone for the Houses of Parliament by Charles Barry, H. T. de la Beche, William Smith and Charles H. Smith, London, 1839, should be referred to, as it was a similar stone to the one recommended that was used in this museum. The stone used here was from North Anston, Yorks, and its composition is given as:—

	Upper bed.	Fourth bed.	Lower or eighth bed.
1. Calcium carbonate . . . . .	52.0	52.5	52.8
Magnesium carbonate . . . . .	45.2	44.7	44.4
Oxide of iron and earthy matter . . . . .	2.0	2.1	2.1
Moisture . . . . .	.8	.7	.7
	100.0	100.0	100.0
2. Calcium carbonate . . . . .		54.89	55.37
Magnesium carbonate . . . . .		42.07	41.71
Protoxide of iron . . . . .		.49	.73
Peroxide of iron . . . . .		.24	—
Protoxide of manganese . . . . .		Trace	1.68
Silica . . . . .		.56	.92
Water . . . . .		.51	.45
		98.76	100.86

From these analyses it will be seen that the stone is as near a true dolomite as possible, the ratio of lime to magnesia (mean of these five analyses) being 1:97.

The following are the main points observed in this examination. The stone facing south-west was more weathered than that facing south-east, doubtless due to the south-west winds being mostly wet, and to its being the prevailing wind (cf. Report, p. 4). It is impossible to give any exact figures as to the amount of stone which has been weathered or has flaked off, but probably it is something between 1 and 3 mm. This rough estimate was made possible by the fact that the stone contains occasional segregations of calcite crystals. These have stood the weather much better than the stone itself, and stood out wart fashion on the surface. Where the rain had fallen directly the stone was rather less black than where it was sheltered. Only a trace of magnesium sulphate could be found on the exposed surfaces, whilst an appreciable amount was found where the stone was sheltered.

A microscopic section of a specimen that had been sheltered from the direct action of the rain was prepared showing the surface in section, which Dr. Flett has described as follows:—

The following notes on the microscopic characters of specimens of the stone of which the Museum of Practical Geology is built, and of their weathered surfaces, are by Dr. J. S. Flett:—

The stone is a granular yellow dolomite consisting mostly of small rhombohedra, often rounded and slightly irregular in outline, but showing perfect crystalline form when occurring in cavities and veins. It contains many irregular-shaped pores, which are sometimes filled up with recrystallised dolomite, and through the rock are scattered rounded patches, apparently concretionary. The blackened surface of the under part of the moulding from which the fragment was taken has been preserved, and is well seen in the section. It is covered with small crystals of gypsum, mostly in the form of monoclinic prisms and swallow-tailed twins. These form a layer mixed with black particles, probably sooty matter, and resting on a thin black film, beneath which the rock is unattacked. The average length of these crystals is about 1-100th inch, and the thickness of the deposit, as preserved in the section, a little greater than this. Outside of the thin basal carbonaceous layer there is no dolomite, but only gypsum, which has apparently been formed by the evaporation of aqueous solutions of sulphate of lime, which have leached out of the stone. The black film upon the surface of the dolomite can be seen, where it is less opaque than usual, to consist of fibres of

gypsum crossing irregularly and mixed with black particles, apparently carbonaceous.

This formation of calcium sulphate, or gypsum, on the surface of marbles and limestones in town is well known.

Sir A. Geikie has gone very thoroughly into this in connection with "Rock Weathering, Measured by the Decay of Tombstones" ("Geological Sketches at Home and Abroad," 1882).

In "Geological Sketches" a figure of the altered surface of a marble will be found, which had stood for eighty-seven years in Edinburgh.

The black edge of gypsum and soot similar to that described by Dr. Flett in his account of the microscopic characters above, is very clearly shown.

In addition to this gypsum deposit on the stone of this museum, in one or two places sheltered from rain small crystals, some as long as 3 mm., were found. These occurred presumably where condensed moisture had evaporated. They were found to be magnesium sulphate.

What has occurred is that the sulphurous and sulphuric acids in the air have attacked the dolomite-forming calcium and magnesium sulphates, and the latter being more soluble has to a great extent been leached out. This is entirely borne out by the following analysis. The sample was collected from the surface of the stone as scraped off by the masons in cleaning it. Hence a certain amount of unaltered stone is also in the sample.

The composition was found to be—

Ignited insoluble residue . . . . .	5.2
Oxides of iron and alumina . . . . .	1.4
Lime . . . . .	26.9
Magnesia . . . . .	9.5
Sulphur trioxide . . . . .	20.7
Carbon dioxide . . . . .	19.4
Water lost at 105° . . . . .	1.8
" " between 105° and 150° . . . . .	9.1
Water above 150° + organic matter . . . . .	6.5
	100.5

If we assume the following molecules to be present (the magnesium sulphate was calculated from the amount of magnesia determined in a solution obtained by extracting with cold water) we get :—

CaSO <sub>4</sub> ·2H <sub>2</sub> O . . . . .	41.7
MgSO <sub>4</sub> ·7H <sub>2</sub> O . . . . .	4.0
CaCO <sub>3</sub> . . . . .	22.2
MgCO <sub>3</sub> . . . . .	18.5
*CaO . . . . .	.9
*(FeAl) <sub>2</sub> O <sub>3</sub> . . . . .	1.4
Residue . . . . .	5.2
Moisture and organic matter . . . . .	6.6
	100.5

Comparing this with the five analyses quoted above, it will be seen that the iron oxide and earthy matter has greatly increased, owing to the leaching out of lime and magnesium sulphates by the action of rain and fog.

In conclusion it must be stated that the alteration of the one surface is to a great extent due to chemical causes, owing to the presence of sulphurous and sulphuric acids in the London atmosphere. These decompose the dolomite-giving sulphates of lime and magnesia. The sulphate of magnesia, being a soluble compound, is to a great extent leached out and washed away by rain. The sulphate of lime, being a sparingly soluble compound, is leached out to a far smaller extent and tends to form a coating (with the soot, &c) which helps to protect the stone. No doubt flaking or scaling play an important part in the weathering as well, but it is not possible here to calculate to what extent.

Suffice it to say that with the exception of a few blocks which were of inferior quality and hence had decomposed to a greater extent considering the time and conditions to which the stone had been exposed, the state was by no means satisfactory.

## GLASGOW ARCHITECTURAL ASSOCIATION.

At a meeting of this Association, held in their own rooms, 11 Pitt Street, Glasgow, on the 15th inst., the President intimated that this autumn the Association celebrates the twenty-fifth anniversary of its foundation. He proceeded to describe how it came into existence through the initiative of Mr. James Lindsay and Mr. William Dunn. These gentlemen early in the year 1878 called together a few kindred spirits to discuss the possibilities of an Association, and set the ball

rolling by a notice in the *Glasgow Herald* calling a meeting of those interested. At this meeting it was resolved to form an Association, rules were submitted and passed, and office-bearers elected. A room for meetings was shortly afterwards secured in the Belgravia College, Newton Terrace. This remained the headquarters for two or three years, when a move was made to more central premises at 101 St. Vincent Street. The stay there was also of short duration, being brought to a sudden and tragic end by a fire. Thereafter a suite of rooms was secured at 114 West Campbell Street, where a successful and progressive existence of about eleven years ensued, till in 1895 the Association joined with the Institute of Architects in securing joint chambers at 187 Pitt Street. The President then reviewed the progress of architecture during the lifetime of the Association, and remarked on the great advances that had been made from a practical and artistic standpoint, and referred to the advantages the younger generation of architects had over those of even thirty years ago, in the latest illustrated works, process prints and the greatly increased facilities for foreign travel. Looking to the present conditions of the art world, he further remarked how the present state of economics had affected it. The competition for trade and the consequent rivalry between nations had raised their patriotic spirit, and had led to a general revival in national literature and art. This was manifested in Scotland by the number of books on Scottish history, &c., being published, the great run on examples of Scottish art, and the restoration during the last few years of quite a number of national monuments. Another pleasing result of this movement was the revived interest being taken by architects in the national phases of architecture in Scotland, especially those delightfully picturesque conceptions of the seventeenth and early eighteenth centuries. The President remarked on the fitness of the style for modern treatment, and diverged into a sketch of the domestic life of that period. He drew attention to the fact that the combined evidence of that domestic life and the buildings themselves clearly showed that Scotland was behind her great neighbours in her handling of the Renaissance, not through lack of originality or taste in her architects, but through lack of means in the country to indulge them. At the close of his address, Mr. Whitelaw remarked on the great benefit it was to the individual as well as to the profession that all architects should be members of their professional societies, and expressed a hope that all those who were not already members of the Institute would hasten to join.

## COMPETITION FOR A GREEK CHURCH.

A REPORT by Mr. Frank W. Jackson, United States Consul at Patras, Greece, gives the following information about the international competition for a church :—

The city of Patras has decided upon the erection of a church to cost 250,000 dols., which will take the place of the present edifice dedicated to St. Andrew, erected early in the second quarter of the last century. With a view to securing something especially apt in design, the committee having the matter in charge (composed of the Metropolitan bishop, the Governor of Achaia, mayor of Patras and other prominent officials) has decided to secure plans through an architectural contest, and I have been assured that contributions from American architects will be welcomed. The general order of architecture will be Byzantine, after the spirit of the East, and the following general conditions should be observed :—

1. The dimensions are left to the discretion of the architect, but must come within a ground space of 25,834 square feet.

2. In planning the structure consideration must be given to possible effects of earthquakes, to which this region is subject.

3. The edifice must accommodate at least 5,000 worshippers, not including standing room in the women's apartments or other annexes.

Possible models of architecture might be found in the Russian church of St. Nicodemus, in Athens, or in the church of Sta Sophia, in Constantinople.

The contest will be divided into two parts. All who pass the first degree will be entitled to enter the second degree, and no others. The general requirements of the first degree are as follows :—

1. To submit a general view of the temple and courts on a scale of 1 to 500.

2. View of front of temple ; scale 1 to 200.

3. Two views, front and lateral ; scale 1 to 200.

4. View cross section, setting forth the general plan according to the judgment of the artist.

5. Estimate of the cost.

6. An abridged technical memorandum.

The plans submitted will be passed upon by the committee, and the successful architects will be required to meet some additional conditions.

\* The CaO and (FeAl)<sub>2</sub>O<sub>3</sub> uncombined here are possibly combined with the silica of the residue and with traces of Cl and P<sub>2</sub>O<sub>5</sub>.

## CONCRETE CONSTRUCTION.

THE cement and concrete exhibits at the Düsseldorf Exhibition furnish examples of the results obtainable with skilled workmanship and good materials properly used. These exhibits are grouped in and about a large terrace on the bank of the Rhine. At the head is a large fountain and basin, adorned with concrete sculptural work, and on each flank is a lofty column. The steps, balustrades and arcades of the terrace are all concrete, and one of the neighbouring buildings is a concrete structure resembling in exterior appearance some of the city halls in small German towns. The columns have a total height of 114½ feet. The foundations extend 18 feet below the surface and are made of 1 part cement to 10 parts gravel, with a grillage of steel beams; the foundations are square and measure 42·7 feet on a side. The rather elaborately ornamented pedestals are 40·3 feet high. The shafts are 52·1 feet high, 7·4 feet in diameter at the base and 6·2 feet at the top. The bottom portion, with ornamental reliefs, is a ring of rammed 1 : 5 concrete, while above the work is a succession of rings of similar concrete with a 1 : 2 plain mortar facing; the rings are about 3½ feet high, and each has six vertical and three horizontal steel rods as reinforcement. The shaft has an ornamental capital with a metal dome surmounted by a large concrete figure. Another special feature of the exhibits is a 1 : 4 : 4 concrete bridge of 98·4 feet span and but 6·56 feet rise. The arch is 2·3 feet thick at the springing and 2·13 feet at the crown, and showed no appreciable deflection under a load of over 90 lbs. per square foot.

## EXPERIMENTS WITH CONCRETE.

IN January 1901 some large blocks of concrete were made under the direction of Mr. W. H. Parkhurst, the American engineer, for the purpose of determining the effect of using different amounts of water in mixing on the character of the resulting material. The concrete was mixed by hand on a plank platform adjacent to the moulds, the ingredients being measured in a box holding 4·42 cubic feet when full, and the quantities checked after measuring by weighing them. The water was also measured and weighed. The details and results of the experiment have been described by Mr. Parkhurst in a paper before the Western Society of Engineers.

The accompanying table gives the general data concerning the three blocks. In the case of the dry block, the endeavour was to employ enough water to make a "mealy" concrete, but not to flush it. No amount of ramming the thin layers would bring water to the surface. With the wet concrete men could not stand on the material to ram it; the mass quaked easily, and the mortar clung to the tamping iron. In the case of the medium block, there was enough water so that the top of each layer was flushed by the tamping, but there was no quaking, and the mass was always hard. The top surface had enough free water on it to spatter when the tamping was finished. The blocks were left exposed to the sun, rain and snow for several months and then drilled and broken by plug and feather. Dragon Portland cement was used. The sand and gravel were obtained by a washing plant from the Fox River, and the crushed stone was of "medium" size.

Data of Concrete Test Blocks.

Block.	Dry.	Medium.	Wet.
Portland cement, cubic foot . . .	4·42	4·42	4·42
Portland cement, lbs. . . . .	392	382	382
Sand, cubic foot . . . . .	8·84	8·84	8·84
Sand, lbs. . . . .	908	895	908
Gravel, cubic foot . . . . .	11·05	11·05	11·05
Gravel, lbs. . . . .	1,104	1,078	1,059
Crushed stone, cubic foot . . .	11·05	11·05	11·05
Crushed stone, lbs. . . . .	939	915	919
Water, cubic foot . . . . .	1·81	2·65	3·35
Water, lbs. . . . .	113	166	209
Vol. concrete, cubic foot . . .	25·31	22·69	22·97
Weight, per cubic foot, lbs. . .	136·2	151·5	151·4
Loss of weight per cubic foot during ten months, lbs. . . . .	1·7	4·5	5·9

In mixing the concrete the sand and cement were made into a mortar on which the crushed stone and gravel were spread. The materials were turned over several times by shovels and then placed in the moulds, where they were tamped in layers 6 inches thick. The dry mixture was placed in its box in twenty-five minutes, the medium in twenty-one minutes, and the wet in twenty-three minutes. The dry concrete required and received the most tamping; the wet concrete required nearly as much time to be placed in the mould because so little could be handled on the shovel. After the blocks were finished the surplus water on those of medium and wet concrete froze; this freezing was of short duration.

The blocks stood for about four months exposed to the weather before they were weighed again. As there was not enough water used in making the dry blocks to permit a finish

on the sides or top, the surface could be easily abraded. The gravel and stone came away from the mass quite easily, and the block could not be handled to weigh it without crumbling the edges and top surface. At the end of the four months all the blocks were found to have lost in weight, but the loss of the dry block was not due wholly to the same causes as that of the others, owing to this abrasion. The loss at the end of ten months is given in the table. After the blocks were split the texture of those of medium and wet concrete was excellent while that of the dry concrete was poor and not well compacted.

The conclusions drawn by Mr. Parkhurst from his experiments are as follows:—First, a medium concrete, or one that has not enough surplus water to produce quaking, while having enough to permit easy and thorough ramming, is most desirable. The specification that the concrete shall not quake in the barrow nor while handling, but that it may be wet enough to quake when heavily rammed, would seem about right for regulating the amount of water to be used. Second, it is probably safer to have an excess than to permit a deficiency of water. Above all, however, it is of the utmost importance that the concrete shall be consolidated thoroughly by ramming.

In the discussion following the presentation of the paper Mr. Finley called attention to another discussion of concrete before the Society in 1896, when Mr. Alfred Noble summarised his opinion as follows:—"It thus appears that while there is considerable diversity of opinion as to the exact degree of wetness concrete should have, none of the engineers quoted advise such dry mixtures as are commonly required here. The writer believes that a more homogeneous, a denser and stronger material will be obtained if the concrete is made so wet that the mass will quake after ramming, and furthermore, that where concrete is to be placed in contracted spaces, as between timbers, it may be with advantage made still wetter, so that it can be pushed into place with the shovel, and by treading filling all the spaces solidly, with no important diminution of strength at any point, but stronger as a whole." In commenting upon this opinion, Mr. Parkhurst approved Mr. Noble's suggestion of using wet concrete well rammed in contracted spaces. If this plan is followed a very much better material is obtained, in his opinion, than where dry concrete is used, which will contain many voids.

Some other experiences with concrete mentioned by Mr. Parkhurst are also of interest. In one case certain columns resting on pile foundations were constructed under the head-house of a railroad station. To protect them concrete walls were built connecting one column with the adjacent one between tracks, the walls being 4½ to 5 feet above ground and extending 2 to 3 feet below the surface. As they were built simply for protection, little attention was paid to the foundation. The ground had been solid three or four years before, but was all dug up when the building was constructed, and had not been thoroughly compacted afterward. Crushed granite and limestone were used, with no sand at all in some cases, and a layer of mortar was placed over the walls as soon as possible after the moulds were removed and before the concrete had set. The walls developed long, irregular, vertical cracks in many places, which were evidently due to bad foundations and not to internal stresses. They were cut to pieces in places and the interior was in excellent condition; in all such cases where wet concrete was used the material was found to be very well compacted.

In using concrete in walls Mr. Parkhurst suggests placing the expansion joints from 20 to 30 feet apart. In one wall on the Illinois Central road there are three concrete sections, making together a length of 100 feet, with pilasters every 33 feet. An artificial joint was made adjacent to each pilaster by putting a septum in the mould and building up to it, then taking it away and building the next section, and repeating the process again. The wall was built while the temperature was 50 to 60 deg. The temperature sometimes falls to 20 degrees below zero, and in such extreme weather the joints open fully one-sixteenth of an inch. No cracks had been observed elsewhere.

## RUSKIN MEMORIAL.

ON Tuesday the foundation-stone of a building which is to commemorate the work of John Ruskin was laid by Lord Avebury at Bournville, near Birmingham. The scheme originated with the Ruskin Society of Birmingham, but it has the support of a number of societies and men and women throughout the country. The intention is to provide a village library, art gallery and museum for the diffusion of those ideals which Ruskin preached. The establishment of classes tending to promote the study of nature and to encourage the revival of handicrafts is another branch of the scheme. A site two and a half acres in extent has been provided by the trustees of the Bournville Village Trust. It is in an elevated situation commanding a good view of the model village of Bournville,

and will be within easy reach of several populous districts. The building is designed in a simple Victorian style. The bricks and tiles will be hand-made, and the blending of the colours of the exterior has been carefully studied. The cost of the building and equipment will be about 5,000*l.*, of which some 2,000*l.* have been promised.

Lord Avebury said the project was in harmony with what his friend Mr. Ruskin would have wished. Alluding to the future of our manufactures and commerce, he said he had never shared the melancholy apprehension which some entertained with regard thereto. Whilst our manufacturers were content to face foreign competition by their own clear heads and strong arms, foreign manufacturers said it would be impossible for them to carry on their businesses if they were not assisted by protection. We were much indebted to those who were showing how it was possible to combine manufacture with country life. With regard to Ruskin's work, it would be a mistake to assume it was merely the outcome of great natural gifts and fortunate circumstances. The advantages which he possessed were just those which had led many to a life of luxury and uselessness. But Mr. Ruskin made the most of his advantages and fought bravely against his disadvantage of ill-health. What he accomplished he accomplished by means of continual application and hard work. His life was a great lesson, better than his advice, better even than his books.

### TESSERÆ.

#### The Doric Order.

EVERY detail of pure Greek architecture is actively engaged in announcing the facts of the upbearing power and the burden which is upborne, and in expressing a just balance of the two forces. The antithetical comparison which is often made between the "verticality" of the Pointed and the "horizontal" of the Greek style is quite without foundation. If this relationship exists anywhere, it is between the Pointed and the Egyptian architectures. In the Doric, and in a less degree in the Ionic style, the aspiring Gothic and the low and heavy Egyptian expressions are perfectly combined; the first expression breathing from every curve and cut of shaft and capital, the latter showing itself, with surprising variety and power, in all the features of the entablature, in the dead unbroken mass of the architrave, in the frieze with its hanging row of triglyphs and guttæ, in the impending corona of the cornice, and, finally, in the low, pyramidal pediment. Ruskin criticises the details of Greek architecture as if they were not architecture—as if they might be plucked from the building, like flowers from the stalk, without any loss of significance; but the fact is that properly speaking they are not decorations at all. The influence of triglyphs does not depend primarily on their severity and simplicity, but on their power, in juxtaposition with the guttæ beneath them, of greatly strengthening the idea of weight in the entablature, by the addition of their pendent effect to the effect of simple mass in the bare architrave below them, and of impension in the cornice above them. Conceal the lines of triglyphs and guttæ in the print of a Doric temple with your paper-knife and the building will look light-headed at once; that is to say, the actively expressed power of support in the shafts will appear to be in painful disproportion to the burden carried by them. Again, we believe that the bark of a tree, or any other "canaliculated organic structure," is the last thing that anyone with no particular theory at heart would ever think of in looking at a fluted shaft. This symbolism may have given birth to the flutes; but the beauty which continued their use and made it in variable, and which, as Ruskin allows, is instantly felt in it, has many accounts better than this to render of itself. The business of the shaft is to support weight; the aim of the Greek architect was to make it express as well as perform that business. The mind instinctively attributes motive and ascendent energy to a series of vertically convergent lines, which are checked before reaching their focus. This effect is much increased in the Doric shaft by the gentle swell or entasis which accompanies its swift taper; but another and far more subtle, and at the same time powerful, reason for the fluting is in the capacity of the series of concave surfaces to express an active resistance against, or rather a denial of, any tendency to burst and crumble beneath the superimposed burden. This may, perhaps, seem a refinement, but let the reader compare the fluted Greek with the smooth "Roman Doric" shaft, and he will probably acknowledge that a certain unpleasant effect which always accompanies the last, and which caused the Greeks invariably to flute their shafts, is mainly owing to the absence of any such suggestion of resisting power. That which sounds like an over-refinement when explained to the understanding is often simple enough to the eye.

#### Lübeck.

Everywhere in Lübeck it is impossible not to be struck with the extreme boldness with which the Mediæval architects trusted to unbroken, unadorned masses of plain, unsophisticated

brickwork. This very simplicity is the evidence of power and of honesty. When shall we learn that there is a dignity in repose and rest, and that many a wall is in no wise improved by arcading and windows at even intervals over its whole surface, when their only object is to look smart and pretty? The houses in this old city have, unhappily, been everywhere whitewashed. They usually present their gables to the street and are arcaded with three or five arches running up into the gables, and within which the various windows are pierced. The civic buildings are singularly fine. The Rathhaus is mainly remarkable for the enormous screen walls, which are carried up to mask the roofs of some parts of the building. All brick architecture seems to have been more or less productive of shams, and here, just as we see in Italy, the shams are on the most prodigious scale. This work deserves description, however, for its intrinsic merits. The screen, on the side towards the street is divided by octagonal turrets into four bays, each bay is subdivided by two brick arches; these are filled in below with tracery panels of two trefoiled lights, and a large circle filled with reticulated tracery formed by the repetition of a brick moulded in the shape of a portion of a quatrefoil; above these tracery panels are two arched openings and a large circle above them fringed with brick cusping. The whole work is executed in black and red brick, without any stone. The back of the same building towards the market-place is very similarly treated, and a good deal of effect is produced by the introduction of a great many brightly-blazoned coats of arms, set within brick medallions. The arcades on the ground level are of brick on stone columns—a good arrangement—for the innumerable jointings of brickwork always make it a rough and weak-looking material for this purpose. The gateways—the Burg Thor and the Holstein Thor—are the last and crowning points of interest in Lübeck. The former is a square gateway, six stages in height, and covered with traceried arcades throughout. The group of buildings close to its inner face is all of the same character, with picturesque stepped gables and traceried brick parapets at the sides. The other gateway is probably the largest and finest in Europe, and its tall slated roofs harmonise admirably with the deep red brick of its enormous expanse of arcaded wall. The string-courses here were double, with the space between them filled in with inlaid terra-cotta enrichments.

#### The Walls of Babylon.

The concurrent testimony of travellers describes the ruins of Babylon as mere mounds of earth, heaps of soil, the remains of houses fallen in. It is probable that most of the private buildings of antiquity were composed of mud or cob, as Rennell describes the modern houses of Bussorah, and adds that after a heavy rain the falling in of houses in the streets is no uncommon occurrence. The magnificence of royalty and pomp of religion were displayed in expensive monuments of brick or stone. To take such an instance as Pæstum, the temple remains, the basilica exists, the stone foundations of the city walls may be traced, while the dwellings of the inhabitants are gone, crumbled into the earth from whence they were made; the grey monuments of a more durable material stand out like the bleached skeleton of some mighty megalotherion whose flesh has long since mouldered into corruption. The celebrated walls of Babylon were certainly not entirely built of brick; the singular mode of their construction has long been a matter of some difficulty. We do not pretend that the process was exactly that of the cob of Devon, although the remains at present are so precisely the same. The difference seems to be that the cob of Babylon was raised dry, in solid forms of unbaked earth, that is, of cob made in detail, laid at certain elevations on layers of reed, and then cemented together. We learn from Herodotus that they were built of the earth which came from the excavation of the surrounding moat. Diodorus Siculus, who gives the most particular account, mentions an interior wall of unbaked brick, or to adopt the words used by Rennell on another occasion, of "clods of earth." This agrees with their present state as described by Sir R. Ker Porter, "masses composed of mud mixed with chopped straw or broken reeds, and then dried in the sun." According to Eusebius, quoting Abydenus, they were rebuilt by Nebuchadnezzar, or, according to Larcher, by Semiramis his wife—the original walls having perished, melted into air. Berosus, a Chaldean author, describing these rebuilt walls, particularly states that some were of burnt and others of unburnt brick. These renewed walls in their turn have crumbled away. St. Jerome, writing in the fourth century, and on the authority of a travelling monk, an eye-witness, relates that they were just sufficient to form an enclosure for the hunting preserves of the Persian king. No trace whatever of these walls can now be discovered at Babylon, although the most careful researches have been made by many and intelligent travellers. They too have vanished, and, like the baseless fabric of a vision, have left no wreck behind; while the walls of Hilla near the site of Babylon are described by Rich "as of mud and presenting a truly contemptible appearance."

### Consulting Electrical Engineers.

SIR,—I enclose a copy of a letter on the subject of professional etiquette in electrical engineering work, which is being sent to-day, by order of my Council, to the clerks of some of the larger counties and boroughs.—I am, yours very truly,

W. G. McMILLAN, Secretary.  
The Institution of Electrical Engineers,  
28 Victoria Street, London, S.W. :

October 17, 1902.

SIR,—As it has come to the knowledge of the Council of this Institution that in several cases consulting engineers have applied for employment, and in others local authorities have advertised for consulting engineers, I am instructed by the Council to forward a copy of the code of etiquette in such matters that, in their opinion, ought to govern all those belonging to the Institution.

I am also instructed to urge upon you the great importance of having electrical work well done at the most moderate outlay, and would point out that by advertising, or by employing those who solicit employment either directly or by agents, local authorities may deprive themselves of the services of electrical engineers of high standing and great experience.—I have the honour to be, sir, your obedient servant,

W. G. McMILLAN, Secretary.

### *Standard of Professional Etiquette for Consulting Electrical Engineers as approved by the Council of the Institution of Electrical Engineers, July 16, 1902.*

1. No consulting engineer should solicit employment as consulting engineer verbally, by letter, by agent paid by commission or otherwise, or by any other means.
2. No consulting engineer should answer advertisements for consulting engineers.
3. No consulting engineer should advertise for employment.
4. No consulting engineer should pay by commission or otherwise any one who introduces clients.
5. No consulting engineer should receive trade or other discount or surreptitious commissions or allowances in connection with any works which he superintends.
6. A consulting engineer who is also directly or indirectly interested in any contracting or manufacturing business should inform his client in writing what his connection is with such contractor.

### Re Transvaal Association of Architects.

SIR,—Since it was decided to alter the title of the South African Association of Engineers and Architects, founded in 1891, and to eliminate the word "Architects," there has been no association in this country adequately representing the profession. The architects belonging to the South African Association of Engineers, with other qualified members of the profession, practising here before the war, have constituted themselves into a separate association to be known as "The Transvaal Association of Architects."

The objects of the Association are primarily to form an influential representative body on the lines of the Royal Institute of British Architects, to whom the Government, the Town Council and other public institutions may refer matters on which they desire the views of the profession, and to represent the views of the profession generally.

At a meeting held on June 5 it was resolved to form an association.

The following gentlemen form the executive:—Viscount Milner, G.C.B., G.C.M.G., hon. president; Mr. E. B. J. Knox, M.I.C.E., A.R.I.B.A., president; Mr. W. Leck, M.S.A., and Mr. G. A. Hamilton Dickson, A.R.I.B.A., vice-presidents; Mr. P. E. Treeby; Mr. G. S. Burt Andrews, M.S.A.; Mr. W. H. Stucke, A.R.I.B.A.; Mr. J. Waterson; Mr. F. Emley, M.S.A.; Mr. G. A. Hamilton Dickson, A.R.I.B.A., hon. sec. and treasurer.—I have the honour to be, your obedient servant,

H. VICKERS, Secretary.

Johannesburg : September 22, 1902.

### Sussex Manors.

SIR,—Your issue of the 17th inst. gave a detailed account of the manor of Streatham and others in the above county. I should like to state that in Lambeth Palace Library there is a collection of Court rolls, stewards' accounts of several of the Sussex manors, and of the "peculiars" of the Archbishopric. The series was catalogued and arranged some years ago, and is available for use on the open library days, Saturdays excepted. To mention places, as Tangmere, Ringmer, the Pallant (Chichester), Amberley, Slindon and

others is to quote but a few examples; local boundaries, name of landowners and other minute matters appear in all these documents of extreme interest.—I am, Sir, yours, &c.,

S. W. KERSHAW, M.A.

October 22, 1902.

### GENERAL.

**The Adelphi Site** for the proposed buildings of the London County Council failed to secure a majority of votes at the meeting on Tuesday. The subject will, no doubt, be indefinitely postponed.

**The Rev. J. H. Horrox**, vicar of Newchurch, has issued an appeal for funds towards the cost of placing in St. Mary's Church, Newchurch-in-Pendle, an east window in memory of Mr. W. Harrison Ainsworth, the novelist, who stayed at Newchurch parsonage to collect materials for his "Lancashire Witches." The scenes in that novel are almost exclusively laid in the parish of Newchurch.

**M. Carolus Duran** has painted on a wall of a small chapel in a forest near Saint-Aygulf the last scene of the "Crucifixion." The place is a holiday resort of the artist.

**The Formal Opening** of the great Nile reservoir and dam at Assuan will take place on December 10, and not on December 9, as had been reported. It is definitely settled that the Duke of Connaught will perform the ceremony. The invitations, which will number about 400, will be issued by the Egyptian Government.

**The Ancient Cloth Hall** at Newbury will be reopened on November 7 by the Master of the Clothworkers' Company, Mr. James Edward Horne. The hall has been restored as a memorial to Queen Victoria, and will in future be utilised as a local museum and art gallery. The building preserves fine wood-carving of the Jacobean period, and stands close to the market-place.

**The Musée Moreau**, which is the gift of the late Gustave Moreau, the painter, will be opened in Paris before the end of November. M. Paul Dubois will be president, and M. Léon Bonnat vice-president of the museum. M. Georges Rouault will be conservator.

**The Governors of Christ's Hospital** have obtained an order for the payment out of court of 150,000*l.*, part of the purchase money (233,000*l.*) in respect of a portion of the site of Christ's Hospital compulsorily acquired by the Governors of St. Bartholomew's Hospital. The money is required to pay for the new buildings to which the boys have been removed at Horsham.

**M. Chartran** has received a commission from the French Government for a large painting which is to represent the ceremony at the Panthéon on the occasion of the centenary of Victor Hugo. It is intended for the Historic Gallery of the Palace of Versailles.

**An Arrangement**, it is understood, has been entered into by which the difference between the Duke of Norfolk and the assessment committee respecting the valuation of Arundel Castle will be terminated. The advisers of the Duke recommended that the rateable value should be raised to 1,650*l.*, and the assessable value to 1,250*l.*

**The Executive Committee** for the Charlotte Yonge memorial have had under consideration Mr. Kempe's drawings and estimates for the proposed rood beam and chancel entrance in Otterbourne Church and the reredos in the lady chapel of Winchester Cathedral. The designs for the work at Otterbourne were approved, as also were those for the reredos, subject to such modifications in detail as may be suggested hereafter. The secretary has been authorised to take the necessary steps to obtain a faculty for the erection of the Otterbourne part of the memorial, but for the reredos, which is to cost 500*l.*, there is still 100*l.* to be subscribed.

**A Bill** will be introduced in the next session to authorise the construction of an underground electric railway from Hammersmith to the City, in connection with the Brompton and Piccadilly Railway Company and the authorised deep-level line of the District Railway.

**The Site** of the Temple of Hera, at Samos, has recently yielded twenty columns and an altar, the latter being in an almost perfect condition.

**Mr. John Faed, R.S.A.**, the Scottish painter, died in his eighty-third year on Wednesday. He was the elder brother of the late Thomas Faed, R.A. For a time he resided in London, but retired to Scotland in 1880.

**The Bronze Statue** of which pieces were dredged at Cerigo has been restored by M. André, the French sculptor. It now bears some resemblance to the *Hermes* of Praxiteles.

**The Decision** of the works committee of the Dundee Town Council disapproving of the plans of the proposed cancer hospital to be erected by Mr. J. K. Caird has been revoked, and the same plans are to be considered as approved.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

ASHTON-IN-MAKERFIELD.—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

DURBAN (NATAL).—Dec. 18.—Designs are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

## CONTRACTS OPEN.

ASTON.—Oct. 31.—For condensers for electricity station. Mr. Reginald P. Wilson, 66 Victoria Street, London.

BANEURY.—For erection of a house and offices in Dashwood Road, Banbury. Mr. J. Timms, architect, 34 Bridge Street, Banbury.

BARNSELY.—Nov. 11.—For erection of outbuildings and conveniences at the Locke Park. Mr. J. Henry Taylor, borough surveyor, Manor House, Barnsley.

BATLEY.—Oct. 27.—For erection of four houses in Victor Street, Batley, Yorks. Mr. John H. Brearley, architect, Branca Road, Batley.

BECKENHAM.—Oct. 27.—For erection of a timber platform over the covered swimming-bath, 100 feet by 30 feet in area, with a movable stage, &c. Mr. John A. Angell, surveyor, Town Hall, Beckenham, Kent.

BECKERMET.—Oct. 30.—For erection of five houses at Beckermert, Cumberland. Mr. J. S. Stout, architect, 36 Lowther Street, Whitehaven.

BILDESTON.—Nov. 2.—For erection of a classroom to the Nedding and Naughton Board school. Mr. Robert Pannifer, Bildeston, Suffolk.

BILSTON.—Nov. 3.—For carrying-out the alterations and extensions of Lower Gornal Robert Street Infants' School, Coseley. Mr. A. Ramsell, architect, 187 Wolverhampton Street, Dudley.

BIRMINGHAM.—Nov. 15.—For erection of sanitary outbuildings at the old school block at the workhouse, Gravelly Hill. Mr. Cooper Whitwell, architect, 23 Temple Row, Birmingham.

BISHOP AUCKLAND.—Nov. 6.—For erection of an administrative block, main pavilion, isolation pavilion, porter's lodge and outbathing block, laundry and disinfecting block, covered ways, boundary walls and fences, water supply, drainage, roads, &c., at the No. 2 isolation hospital buildings at Helmington Row. Mr. William Perkins, architect, Victoria Street Bishop Auckland.

BRIGHTON.—Nov. 5.—For alterations to part of the Royal Pavilion in Palace Place to adapt the premises to the purposes of a telephone exchange, &c. Mr. Francis J. C. May, surveyor, Town Hall, Brighton.

BROMSGROVE.—Nov. 15.—For erection of the first portion of the proposed new lunatic asylum on the Barnsley Hall estate, near Bromsgrove, Worcestershire. Mr. George T. Hine, architect, 35 Parliament Street, Westminster.

BURTON-ON-TRENT.—Nov. 5.—For overhead equipment of the tramlines, &c. Messrs. Kincaid, Waller & Manville, 29 Great George Street, Westminster.

COALVILLE.—Nov. 4.—For supply and delivery of the pipes and specials required in the construction of new waterworks. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

COALVILLE.—Nov. 4.—For supply and delivery of No. 192 sluice, air and reflux valves, No. 219 screw-down hydrants, No. 89 expansion joints, and No. 4 Deacon's waste-detecting meters, with other fittings, surface boxes, name plates and posts required in the construction of new waterworks. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

COALVILLE.—Nov. 4.—For construction of a service reservoir to hold 500,000 gallons, the laying and jointing of mains, fixing fittings and testing and other work required in the construction of new waterworks. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

COALVILLE.—Nov. 4.—For erection at the proposed new pumping station of two compound inverted tandem pumping engines, each capable of lifting not less than 240,000 gallons of water in twelve hours, and two steel Lancashire boilers, 6 feet 6 inches diameter, 20 feet long, including steam and water

## INTERNATIONAL FIRE EXHIBITION, EARL'S COURT, 1903.

At the executive meeting of the British Fire Prevention Committee held on the 15th inst., the announcement was made that the committee's preliminary arrangements for the International Fire Exhibition had been completed and the general programme finally decided upon. An eminently influential advisory council, representative of the great technical and fire interests and headed by the President of the Royal Society and presidents of the leading scientific institutions, has now been duly constituted and the various working sub-committees are in course of formation.

The hearty co-operation of the Duke of Marlborough, K.G., president, and the leading members of the National Fire Brigades Union, the officials of the Private Fire Brigades Association and St. John Ambulance Association has been assured, whilst the various continental fire authorities have promised active assistance.

The preliminary work for the Fire Congress to be held next year at the time of the exhibition has also now been started under the direction of Mr. Edwin O. Sachs, chairman of the Fire Prevention Committee. A number of important questions will be discussed at this conference, at which the leading authorities of all countries will be represented.

The exhibition will have the advantage of eminently interesting exhibits in the way of modern constructional and engineering work and the latest fire appliances, as also in the form of paintings, engravings and historical relics, so that the subject of fire protection, which is of so much interest to the Metropolis of late, will be most exhaustively treated in every way.

## TENDERS.

### BASFORD.

For street works in five streets at Ilkeston Junction. Mr. G. W. HAWLEY, surveyor, York Chambers, King Street, Nottingham.

# WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

PRICE

5/- per foot super.

Wilson's Patent  
"SAFETY" Pavement  
Lights prevent slipping

Wilson's "DIOPTRIC"  
Pavement Lights are  
an improvement on  
the semi-prism at the  
same price.

COLUMNS, STANCHIONS,  
CIRDERS, AND ALL ARCHI-  
TECTURAL CASTINGS.

**WILSON & CO.**  
24 HARRISON STREET,  
GRAY'S INN ROAD,  
LONDON, E.C.

## TRADE NOTES.

THE Baptist schools, East Finchley, have recently been fitted with the latest improved hot-water heating apparatus, by Messrs. John King, Ltd, engineers, Liverpool.

THE City of Sheffield Hospital, Lodge Moor, is being warmed and ventilated by means of Shorlands' double-fronted patent Manchester stoves in glazed faience, and under-bed ventilators, by Messrs. E. H. Shorland & Brother, of Manchester.

THE CHERRY TREE MACHINE CO., LTD, engineers and ironfounders, Cherrytree, near Blackburn, have just supplied one of their metal rotary steam-pressure washing machines to the Royal Naval Hospital, Plymouth, for the Lords Commissioners of the Admiralty.

THE COLUMBIAN FIREPROOFING CO., LTD., 37 King William Street, E.C., have commenced their contract for fire-proof floors and roofs at the Kirkcaldy electric generating station for the Kirkcaldy Corporation, and have now virtually completed their large job of floors and roofs at the electric generating station at Bow, for the Charing Cross and Strand Electricity Corporation, Ltd.

MESSRS. GEORGE JENNINGS, LTD., Lambeth Palace Road, S.E., have at present in hand the sanitary work and drainage at Messrs. Gooch's new premises in the Brompton Road, S.W., under the architects, Messrs. Ford, Son & Burrows. They are also executing the sanitary work, drainage, &c., at the Bank of England's new premises for the National Debt, and offices in Old Jewry and Princes Street, City, for Mr. A. C. Blomfield, architect.

IN the old church of Fridaythorpe, East Yorks, now being restored by Sir Tatton Sykes, Bart., Sledmere, a new clock is to be erected as a memorial to the late Mr. Sellers, of York. The trustees have placed the order with Messrs. Wm. Potts & Sons, of Leeds and Newcastle-on-Tyne, who are now making some clocks for South Africa.

THE convenient portable telescopic ladder towers of Heathman & Co., at Parson's Green, S.W., are receiving the adoption they deserve. The War Department recently ordered fifty, and all have been delivered, rigidly examined and tested, and not one rejected. Visitors to the State apartments of Windsor Castle can see these Heathman portable scaffold towers, as two sets are invariably in use in one or other of the rooms, and prove a great convenience for

cleaning the cornices and ceilings. It is claimed that some 70% was saved in the employment of one for men to clean the armour hung in Hampton Court Palace; some 30% was saved through the use of one for hanging sun-blinds under skylights at the National Gallery, and a similar sum at the Royal Gallery of British Art. At the Café Monico the cost of a set was saved in the restoration of the ceiling of the grand dining saloon, since which they have been used in all the other rooms of the building. A set is kept at the Portman Rooms in Baker Street, and put into annual use for cleaning the painted ceilings.

## ELECTRIC NOTES.

THE Colchester Council have adopted the system of overhead electric trams at an outlay of nearly 70,000*l.*, refusing to have anything to do with any outside company.

ON the 20th inst. Councillor Amos Chippindale, as chairman of the Harrogate electric-light committee, at a Local Government Board inquiry before Major C. E. Norton, gave particulars respecting the increase in the use of electricity in Harrogate. In 1897, when the works were first opened, they supplied equal to 8,700 candle-power, whilst last year the amount had increased to 41,800. During the first two years the undertaking involved a loss of 1,997*l.*, on the third year there was a profit of 777*l.*, the following year 1,046*l.*, and last year there was a profit of 1,758*l.*, after repaying interest and capital. Of this 73% had gone towards the relief of the local rates. The inquiry was to obtain sanction to borrow 46,000*l.* for the purpose of extension of plant to meet the increasing demand. There was no opposition.

THE Leyton Urban District Council announce that it has made a profit on its electric-light supply station during the past six months of 700*l.* According to a statement just made by the Council's electrical engineer, Mr. F. H. Lewis, the rate-payers in this district are in possession of a rapidly increasing asset of considerable value, as represented by the electric-lighting station and plant. Whereas in 1897—the year in which the station was inaugurated—there were only 2,982 lamps connected with the system, and 28,591 units sold in the twelvemonth, at present there are 40,000 lamps connected, and the financial year now closed saw a total of 811,141 units sold. To provide for this enormous increase in the output of electricity, the Council is at present having laid down an extensive plant of steam-engines, having had to discard the use of gas-

engines upon an injunction of the High Court. There are already laid down five steam-engines of 360 horse-power each, and workmen are now putting in a sixth engine, which will generate 700 horse-power and work an extra large dynamo just purchased. In the adjoining township of Walthamstow the District Council's electric-lighting station contains equally powerful engines, and though this station was opened only a year ago it was described at the Council meeting on the 20th inst. as "already a little gold mine for the ratepayers."

### VARIETIES.

PRINCESS CHRISTIAN OF SCHLESWIG-HOLSTEIN will open Brentford's new workhouse, which has been erected at Isleworth at a cost of 100,000*l.*, on Tuesday, November 4.

At the village of Swanscombe, Kent, a manse for the minister of the Congregational church is being built by the free labour of young men who are associated with the church, and who are also connected with the building trade.

The directors of the London and Lancashire Fire Insurance Company have declared an interim dividend of 5*s.* per share (as compared with last year's interim dividend of 4*s.* per share), payable on November next.

The body of Mr. James Casey, town clerk of Tralee, was found on the shore at Spa, four miles from Tralee. Mr. Casey, who was subject to fits, is believed to have been taken ill when walking on the beach.

The Roman Catholic church of St. Mary at Malton has been reopened after undergoing complete restoration. The church has had a new floor and new roof constructed, has been relighted and reseated, and a new interior porch and several new rooms erected. The work of restoration has cost 300*l.*

A SYSTEM of water supply for Ripponden, Soyland Town and Mill Bank has just been completed by the Soyland District Council. The reservoir, which is situate at Black House Farm, has a water area of 1½ acre, and a holding capacity of nearly seven million gallons. Altogether the scheme, including works and land, has cost 17,500*l.*

The Bishop of Shrewsbury (Dr. Allen) opened the new Catholic church of St. Mary, Latchford, Warrington, on Monday. The church, which accommodates 600 persons, has been erected in St. Mary Street, and adjoins the schools, which up to the present have also been used as a church. It is

intended at some future time to erect a tower and spire. The cost has been about 6,000*l.*

*Commercial Intelligence*, Mr. H. Sell's very useful trade weekly, celebrates with its this week's issue its fourth anniversary. We are glad to see that the high standard of useful information aimed at in the first number has been fully maintained, and notice that among the valuable matter comprised in the present issue is an interesting article on the "Past Steamship Service to Canada."

A GOOD deal of work is going on at Osborne, in view of the changes which are to take effect early next year. Although tons of statuary and other art treasures have been removed to Buckingham Palace and Windsor in a dozen or more pantech-nicon vans, there is still a magnificent display remaining in the late Queen's island home. Until the transfer has been effected Osborne remains under the control of the Keeper of the King's Privy Purse. What is known as the Household Wing will be used for the purposes of the convalescent hospital for army and naval officers.

THE London School Board have decided to introduce the following regulation for insurance by builders:—"In the event of any property being subjected to special risk from fire by reason of work being done on the premises by a contractor, it shall be the duty of the Works Department to communicate with the Accountant's Department. If the property be insured in the Board's Fund, the contractor shall be required to insure it in an insurance office during the progress of the work, and the insurance in the Board's Fund shall automatically cease pending the continuance of this insurance. If the property be already insured in an insurance office, that office shall be advised of the work, and any additional premium which may be charged to cover the special risk shall be paid by the contractor."

THE new Opera House at Tunbridge Wells was formally opened on the 16th inst. It provides seating accommodation for 1,100, has been constructed from designs and plans prepared by Mr. John P. Briggs, Effingham House, Arundel Street, Strand, and built by Mr. John Jarvis, Tunbridge Wells. There are dwelling-houses, shops, warehouses, &c., facing on to four roads connecting Monson Road with Newton Road. The main entrance is just opposite Dudley Road. Over the pathway in front of the principal entrance is an iron and glass verandah. Above this is a balcony with some handsome colonnading, and above this rises to a height of

60 feet from the ground an effective and finely proportioned cupola, the dome of which will be surmounted by the electric light at night-time. The façade is in the Georgian style of architecture, and the interior decorations are of the style of Louis XV.

THE new over-cliff drive, which has been constructed by the Bournemouth Corporation on the West Cliff, at a cost of 10,000*l*, was formally declared open by the Mayor of the borough on the 16th inst. Mr. J. E. Cooper Dean, the ground landlord, presented to the town the cliff front, with two acres of land in addition for pleasure grounds. The drive affords views of the Isle of Wight, Purbeck Hills, Corfe Castle, Old Harry Rocks, &c., and winds its way along Alum Chine amid stretches of gorse and bracken. After the ceremony a luncheon was given, and attended by the Mayor and Corporation and many leading inhabitants. It was stated that it was anticipated, as the result of a recent interview with Sir George Meyrick, the East Cliff frontage will be handed over to the town, and in all probability a drive constructed connecting the East and West Cliffs. It was also intimated that the drive just opened will be named King Edward's Drive.

THE following is a list of students to whom National Scholarships (Art) and Free Studentships (Art) have been awarded:—*National Scholarships*.—Harry C. Smith, Dundee; Henry A. Hall, Leeds; Oswald Schwemmer, Manchester Municipal School of Art; William M'Bride, Dublin; Frank P. Brown, Stoke-on-Trent; Lightowler, Manchester School of Art; Sidney Boyes, Southampton; George J. Mitchell, Dundee; Joseph R. Shea, Burnley; Herbert A. Budd, Hanley; James R. G. Exley, Skipton; Annie W. Morton, Edinburgh; William M. Whitehead, Burnley; John Gibson, Bury; Norman M. Morrow, Belfast; Annie R. Hetherington, Carlisle.

WE regret to announce the death of Mr. W. B. Wilkinson, of Newcastle-on-Tyne, on the 13th inst. in his eighty-fourth year. He was the founder of the well-known firm of W. B. Wilkinson & Co., Ltd., of Newcastle-on-Tyne and London, and was the originator of the now universally known concrete pavings. The first floor ever laid in this form was a greenhouse floor in Newcastle-on-Tyne by this firm, and afterwards the business developed to an enormous extent, their paving being

laid all over the kingdom and even as far away as Lisbon. Mr. Wilkinson took out a patent in 1854 for fireproof construction, and in many respects this has never been improved upon. He used wire rope and small bars embedded below the neutral axis of the concrete. In 1856 he patented a hollow tubular fireproof and soundproof partition, and in the eighties an ornamental concrete paving which he called "Specular Granitic." The deceased gentleman was a J.P. and was chairman of the Newcastle and Gateshead Gas Company, director of the Newcastle and Gateshead Water Company and the North Shields Gas Company, and was connected with many of the largest businesses of the North of England, while his connection with philanthropic institutions of the district was equally extensive.

WE have received particulars of the "Gasteam" radiator, which, as its name suggests, is one that with gas for fuel radiates steam heat. These radiators, which are well-finished and artistic in appearance, have several improvements embodied in them that deserve attention, one of the more important being the automatic regulation of the amount of gas consumed by means of a valve which closes when the radiator has become properly heated, leaving only sufficient gas alight to keep it to that temperature. These radiators are guaranteed by the makers to be odourless, provided that sufficient water is maintained in the reservoir, and to insure this they are fitted with a gauge glass, by means of which the amount can readily be ascertained. Among the advantages claimed is the small consumption of gas, about 1½ feet per section per hour; also that they take up very little space, can be heated at any time by applying a light to the burner, and as easily dispensed with by turning off the gas; they are self-contained, and can be attached to the nearest gas-pipe at a trifling cost. The "Gasteam" radiator is suitable for heating rooms, halls, churches, schools, theatres, &c., and to those desiring fuller particulars Messrs. Hendry & Pattison, Ltd., 11 Hills Place, Oxford Street, W., will be glad to furnish them.

THE facings required for the new Wellington town hall, New Zealand, are being imported from Sydney, though subject to a duty of 25 per cent. The cause is the scarcity of stonemasons in Wellington.

**BUILDING AND BUILDERS.**

THE foundation-stone in connection with the new Wesleyan Sunday schools at Westgate Hill, Cleckheaton, which are to be erected at a cost of 6,000 $\frac{1}{2}$ ., was laid on Saturday.

ON the 18th inst. Mr. Alderman J. F. Wilkinson laid the memorial-stone of an extension to the Monton Wesleyan school church in Grange Drive, Manchester.

THE foundation-stone has been laid of a new Sunday school which is to be erected in connection with the Independen, Methodist church, Barton Road, Stretford, Manchester.

HER Royal Highness Princess Christian visited Hampstead on Tuesday to lay the foundation-stone of the new hospital to be erected at a cost which is estimated at 30,000 $\frac{1}{2}$  at the rear of the North-Western Hospital at Hampstead Green.

THE foundation-stone of the Queen Victoria Memorial Church, Eccles New Road, Weaste, was laid on the 18th inst. The church is being erected on a site valued at 1,800 $\frac{1}{2}$ ., which has been given. The building, which will accommodate 400 persons, is to cost 3,500 $\frac{1}{2}$ .. The work is being carried out from the designs of Messrs. Royle & Bennett, of Manchester.

WORK has been commenced on the new Marlborough Theatre, which Mr. F. W. Purcell (proprietor of the successful Alexandra Theatre, Stoke Newington, and of several important provincial theatres) is erecting in a very commanding position in the Holloway Road, nearly opposite the Nag's Head. Mr. Frank Matcham is the architect, a fact which promises much for the beauty and comfort of the new theatre, which will, we understand, be under Mr. Purcell's personal management.

THE members of the Merthyr Tydfil District Council have been engaged for several years in developing a scheme for housing the working classes. Five hundred cottages are to be built, and of these 100 are now in course of erection in the populous district of Penydarren. In view of the early completion of a number of these tenements (thirty-six are expected to be ready at the end of the year) the Council have decided to fix the rentals at 22s. 6 $\frac{1}{2}$ d. per month.

AT Ettington, near Stratford-on-Avon, the foundation-stone was laid on the 16th inst. of a new parish church, the old one being sadly out of repair and otherwise unsatisfactory. The work which Messrs. Collins & Godfrey (the contractors) have now in hand will cost about 3,000 $\frac{1}{2}$ ., and the fittings and furniture have yet to be provided. The new church has been

designed by Mr. C. Ford Whitcombe, and is a cruciform structure in the Perpendicular style. The work will be proceeded with in sections as funds permit.

AT the monthly meeting of the Pwllheli Town Council the principal business was the reception of the report of the harbour committee. Mr. Douglass, the engineer of the harbour scheme, attended the committee for consultation purposes. Acting on the advice of Mr. Douglass, the committee had requested some of the contractors who had tendered for the work under the original scheme to tender for a modified scheme. A few sent in amended tenders, and the committee recommended the adoption of the plans and the tenders sent in by Mr. E. R. Lester as the basis of negotiation for the modified scheme. Alderman Anthony said the cost would be a few pounds under 50,000 $\frac{1}{2}$ .. Mr. R. Ivor Parry moved that consideration of the matter be deferred. Mr. Winslow, in seconding, said the amended scheme was a new scheme, and that it should be brought before the ratepayers in the same way as the original scheme had been brought. Four voted for the adjournment and eight for the adoption of the committee's recommendation. The clerk was requested to write informing the Cambrian Railway Company that the Council had at last adopted the amended plans of the new scheme.

AT a recent meeting of the Leith Dock Commission, Mr. John Wilson presiding, Mr. R. Cross stated that, unless some more rapid progress was made in the deepening of the entrance to the new dock, the larger ships for which it was intended could not be admitted before September next. The General Works Construction Company had denied responsibility for one part of the work, which the Commissioners were getting done by another contractor on the understanding that the cost would be charged to them. But he thought they should hire or buy a more powerful dredger than was employed, and take the work in hand themselves, or make a fresh arrangement with some contractor who would get it done. The Chairman said difficulties had arisen which could not have been foreseen two years ago, but some drastic step was necessary, and the matter was remitted for report. The works committee intimated that they could not advise the Commission to proceed with the construction of a graving dock in connection with the new dock meantime, in view of the financial reasons put forward by the finance committee. The report was adopted.

THE Southport Corporation and the Pier Company directors have now arrived at an understanding with reference to the

improvements at the pier entrance. A year or two ago the pier directors came under an obligation to the town to set back the pier approach a distance of 67 feet 6 inches, but under the new bargain the entrance will be 112 feet 6 inches from the present line. The scheme of the Corporation includes the building of a retaining wall between the first buttress of the marine bridge and the approach to the lower parade on the south side of the pier entrance. The intervening space will be filled with sand. The Pier Company, on the other hand, receive a considerable amount of land in frontage, and for this they will pay 650/. A short time ago the Corporation came to an agreement with the Victoria Hotel directors for the purchase of vaults at a cost of 5,000/. By these two transactions the Corporation will be enabled to carry out one of the most important improvements effected in Southport within recent years. The Victoria vaults will soon be a thing of the past, and a magnificent road of wooden setts will stretch up to the pier. The total cost of the whole scheme cannot be far short of 10,000/.

THE Farnham Urban Council are proposing to expend the sum of 4,000/. for the purpose of providing dwellings under Part 3 of the Housing of the Working Classes Act, 1890, and with this sum two sites have been provisionally secured for the erection of eight and twelve houses, which will accommodate in all 100 persons. The Local Government Board inquiry into the proposed loan brought to light some unpleasantly suggestive facts. It was stated that during the last twenty years only seventeen cottages had been built for workmen, and some of these were simply converted hopkilns. In one case a man and his wife and six children lodged in a house occupied by a man and his wife, the four adults and six children having only two bedrooms between them. The family were turned out, and after the father had lost three days in trying to find a cottage he put his family in a henhouse. In yet another case there was a cottage occupied by a child of three years, suffering from consumption, who died within a week. The other members of the family were the father and mother, three sons (aged seventeen, ten and eight respectively), two other girls (aged twelve and six respectively), and a seven months' old infant. Many families have been driven from Farnham by their inability to get cottages.

AT a meeting of the sub-committee of the district committee of Upper Renfrewshire—Mr. Henry Erskine Gordon, of Aikenhead, presiding—a plan and section of a modified scheme for rebuilding Auldhouse Joint Bridge and improving the lines

and levels of the approaches thereto, prepared by the district road surveyor and the burgh surveyor, was submitted, along with a report and estimate of the cost. The report stated:—"It is proposed to widen the Thornliebank Road to 60 feet from Auldhouse Gate to Auldhouse Bridge, and to widen Harriet Street within the burgh of Pollokshaws to 60 feet from the Auldhouse Bridge to the north-east boundary of Well Meadow Laundry; also, to rebuild Auldhouse Bridge and improve the gradients of the road between Auldhouse Road and Greenbank Street by raising the level about 3 feet at the bridge and by cutting a portion off Harriet Street." The total cost of the work was estimated at 3,359/. 15s., of which 1,800/. 10s. would be payable by the Upper district committee and 1,559/. 5s. by the Town Council of Pollokshaws. The sub-committee resolved to recommend that the district committee agree to the work being carried out, subject to sufficient contributions being received from the Glasgow Corporation Water and Tramways Departments towards the cost. It should be added that the Glasgow Water Department are to lay a new main over the bridge, and it is anticipated that tram lines will also be laid down.

### CORRUGATED ARCHED DECKING FOR BRIDGES, FLOORS AND ROOFS.

THIS decking is of rched form, corrugated to a uniform depth over five-eighths of the central span, and then tapering on either side to a flat flange, which takes a bearing on girders or abutments. The plates forming the deck are stamped or pressed from the flat in one operation; they vary in width, depth of corrugation and thickness of metal according to the span and load; they can be made up to a 30-feet span, and for ordinary spans they are usually 6 to 7 feet wide finished. For small bridges of less than 30 feet span no girders or rods to tie in the arch are required.

The deck is well suited to all classes of heavy and light bridgework, the thrust of the arches being easily ascertained and allowed for in the rivets of the flanges and in the tie rods to accommodate any loads. No stiffeners are required.

Work can be delivered and fixed in far less time than with any other form of decking, time, labour and material being greatly reduced, while, span for span, strength has been increased. For concrete floors and roofs the decking is of a lighter character; but wide spans between joists or girders are

arranged for. When the tie rods spacing the girders are in, the decking can be fixed at any time; very few bolts or rivets are necessary to secure the deck to the girders, and connections between the plates are made with cold rivets. For factories, warehouses, strong-rooms and all buildings where strength and economy have to be considered this flooring is especially well adapted.

Further particulars can be obtained either from the Corrugated Arch Decking Company, 55 and 56 Chancery Lane, W.C., or Messrs. Hemingways, Ltd., Haverton Hill, Middlesbrough, and 9 Broad Street House, E.C.

### AUCTIONEERS' INSTITUTE.

THE opening meeting of the session of the Auctioneers' Institute was held on Wednesday evening at the Medical Examination Hall, Victoria Embankment, when the president, Mr. John Hepper, delivered his inaugural address.

Devoting himself mainly to matters connected with daily business and current events, the President said that the refusal of their application for a Royal Charter would have the effect of causing the Council to strive in every way to broaden the foundations and strengthen the influence of the Institute, so that it should be a power to be reckoned with, and should hold a position second to none in its usefulness. This must be loyally aided by the committees of the various branches.

The country was alive with the cry of education. What for? Primarily because it was essential to the maintenance of our commercial supremacy. Education was to be found in the school and the college, but there was a continuation school of vast importance—the school of experience. In this the wise man was a daily student, and in proportion to his cultivation therein and thereby would be his fulness of knowledge, the measure of his usefulness to the world, the gauge of his powers. He who sets a low standard of attainment for himself was often deficient in moral purpose and self-respect, and he was contented with small things. If he was no more than his license made him—an auctioneer without qualifications—he was unworthy of the dignity of a Royal Charter, and therefore ought not to possess its privileges. In conclusion Mr. Hepper paid a high tribute to the memory of the late Mr. J. F. Field, an ardent supporter and past president of the Institute.

The medals gained at the last examinations were presented during the evening.

### THE AUCTIONEERS' BENEVOLENT FUND.

THE annual meeting of the Incorporated Auctioneers' Benevolent Fund was held at the Mart, Tokenhouse Yard, Mr. E. W. Rushworth presiding. The report and statement of accounts showed that there was a slight falling off in the subscriptions and donations during the year. The total receipts under that head amounted to 436*l.* 16*s.* The annuities now numbered fourteen, and further grants amounting to 50*l.* had been made at a committee meeting that afternoon. Mr. Daniel Watney was re-elected treasurer.

The meeting next proceeded to the consideration of a motion by Mr. F. Eiloart, one of the members of the committee of management, to the effect that a sub-committee be appointed to consider the advisability of amalgamating the capital of the Fund with that of the Benevolent Fund of the Auctioneers' Institute. Mr. Eiloart pointed out that the total amount invested in the name of the Fund was 10,669*l.* 1*s.* 4*d.*, and he argued that as the two funds were organised and subscribed to for benefiting the same class of people, they could be more economically managed and efficiently distributed under one management. He protested against the hoarding up of the subscriptions for investments, and pointed out that during the last three years the average income from subscriptions and interest was 825*l.* 11*s.* 3*d.* per annum, and they had spent in grants and annuities 436*l.* 6*s.* 8*d.*

Mr. Warman seconded the motion.

Mr. Galsworthy and Mr. Watney opposed the proposal, and the Chairman took the same view, remarking that the idea of the committee in having a large amount invested was to keep the annuities secure, so that whatever happened to the subscriptions the annuitants should always receive their money.

The motion was negatived by a large majority.

### MUNICIPAL BUILDING SPECULATIONS.

THE *Times*, in a leading article, says:—The fifteenth of our articles on Municipal Socialism, which we publish to-day, deals with the intervention of municipalities in the provision of houses for the working classes. This branch of the subject happily illustrates by the proceedings of different municipalities the general principle which ought to govern the delimitation of the spheres of private and municipal enterprise. That principle

Liberal Commission allowed to BUILDERS AND ARCHITECTS for introduction of Business.

is that municipalities ought not to undertake directly to supply a public want until it is clearly demonstrated that the ordinary social, commercial and industrial machinery is incapable of doing the work efficiently under proper and vigilant municipal supervision. Putting aside all theoretical or political objections to municipal trading, this principle rests upon a sound business basis. That basis is that experience proves abundantly what knowledge of human nature would lead us to expect—that commercial undertakings are never managed so efficiently and economically by a fluctuating body of municipal representatives as by men directly and personally interested in their success. It is no doubt possible to point to apparent exceptions to this as to every other rule. There are municipalities which contrive to get an exceptionally good class of citizens to attend to public affairs, and which carry on some specific undertaking, such as the supply of water, in a manner that leaves nothing to be desired. It may be doubted, however, whether even in these cases results at least equally good might not have been attained had the municipalities in question confined themselves to their proper work of supervising and controlling those who minister to great and general public wants in such a manner as to secure the greatest possible public benefit without frightening capital away altogether. As soon as we pass from a limited class of undertakings in which the whole community, without exception, are interested, the objections to municipal supply become indefinitely stronger. When we find a municipality prepared to take into its own hands anything and everything which in private hands is showing a profit, we get at once into a region of economic disorganisation from which spring evils tenfold greater than arise even from wholly unregulated private enterprise. The municipalities which abandon their proper work of control and supervision, and of obtaining when necessary legislation to make their control effective, have themselves to be controlled by a central department. But whatever may be the case elsewhere, it is generally true in this country that a Government department is a slow, wasteful, obstructive and inefficient machine for conducting business. A municipality is inefficient enough in itself, but a municipality doubled with central control—and no one is rash enough to venture to dispense with it—is probably the very worst business combination that perverse ingenuity has yet developed.

Our correspondent shows what, indeed, is common knowledge among all who have given any attention to the matter, that municipal house building is a failure. When all sorts of

dodges have been resorted to in order to lighten the apparent cost of providing workmen's dwellings, the fact stares us in the face that the dwellings are beyond the means of the class for which they were ostensibly built, or that municipal regulations are too irksome for that class to put up with. There is a showy but not very practical Act of Parliament which saddles municipalities with initial costs and delays enough of themselves to destroy the business prospects of a building speculation. Putting these aside, we find that the municipal employer does not get the same value for money as the private one. Overseers and workmen alike think the public purse inexhaustible and a proper subject for plunder. The municipal council consist of gentlemen who depend upon the votes of their own servants and can most easily secure them by laxity in control. The demoralisation spreads, the private builder cannot get more work than the public one exacts, and the result is that the rents of workmen's houses steadily rise in spite of disguised eleemosynary aid. Not only so, but in many cases there is an absolute dearth of houses, whereupon a cry is raised not for a return to common sense but for more municipal building with a more frank and complete reliance upon the rates. Accordingly, the rates are rising with alarming rapidity in most places, and the rise is contemplated with absolute satisfaction by our Socialist theorists. They think they are making the well-to-do pay for the poor and idle. They are really inflicting a loss upon the community, and that loss will fall in the long run most heavily upon the poor, in spite of all the legislation in the world. The poor are far more deeply interested than the rich in the wise conservation of national resources.

The same Act which in Part I. provides cumbrous and costly, though showy means of dealing with insanitary areas, does by some happy accident provide in Part II. a simple and inexpensive means of shutting up insanitary houses, and incidentally getting better ones provided on business principles by private builders. But municipalities generally elect to adopt the showy, dilatory and costly method, ending in failure to supply the poor with houses, instead of the simple and unostentatious method which supplies the houses without bleeding the ratepayer or demoralising the workmen. Some municipalities, as our correspondent shows, use their summary powers to close insanitary dwellings, leaving their owners to put them in proper condition at their own expense, which is the right thing to do. If these owners fail to supply proper accommodation other men are ready,

## ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889.)

*PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for Framing.*

**THE EXALTATION OF ART.** (Ceiling Painting in the Hôtel de Ville, Paris.) By Mons. LÉON J. F. BONNAT. (Printed in Colours Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

**MASTER BUNBURY.** From the Painting by Sir JOSHUA REYNOLDS. Size, Twenty Inches by Fifteen Inches. Price, One Shilling free by post, carefully packed inside patent roller.

**ST. PAUL PREACHING AT EPHESUS.** By EUSTACHE LE SUEUR. From the Painting in the Louvre. Printed in red & black. Size, Thirty Inches in depth by Twenty Inches in width. Price, Two and Sixpence each; free by post, carefully packed inside patent roller.

**A TURKISH MASSACRE.** From the Painting by EUGÈNE DELACROIX. Size, Thirty Inches by Twenty-two Inches. Price, Two Shillings each; free by post, carefully packed inside patent roller.

**AN ITALIAN GIRL.** By WALTER BLACKMAN. Size, Thirteen and a Half Inches by Nine and a Half Inches. Price, Sixpence each free by post, carefully packed inside patent roller.

**PANELS BY F. BARTOLOZZI, R.A.** After J. B. CIPRIANI, R.A. Printed in the famous Bartolozzi red. Size, Twenty-six Inches in length by Fifteen Inches in depth. Price, Three Shillings and Sixpence the Pair; free by post, carefully packed inside patent roller.

**THE ROMANS OF THE DECADENCE.** From the Painting by THOMAS COUTURE. Size, Twenty Inches by Fourteen and Three quarter Inches. Price, One Shilling and Sixpence; free by post, carefully packed inside patent roller.

**THE GALLAND FRIEZE.** From the Wall Paintings in the Hôtel de Ville, Paris, by P. V. GALLAND. Eighteen pieces printed in Terra Cotta with Gold background.

in the absence of municipal competition, as a business matter to build houses meeting legal requirements, and in neither case does the ratepayer suffer, while in both cases the poor get proper dwellings at rents within their means. Why is this not done everywhere? Partly because it is not showy enough; partly because there are no pickings to be made out of it, while big municipal schemes can be made to yield very good private returns; and partly because the owners of insanitary properties are often on the Council and prefer to be bought out at a fancy price rather than to have to put their houses in order at their own cost. There would be much less municipal socialism if there were not so much keen individualism in municipal councils.

### LIGHTING, HEATING AND SMOKE ABATEMENT EXHIBITION AT THE CRYSTAL PALACE.

THE Lighting, Heating and Smoke Abatement Exhibition at the Crystal Palace is to be opened on Saturday, December 13, for five weeks. Preparations for a really representative display were commenced many months ago, and from the progress already made there is no doubt that the forthcoming exhibition will cover a much wider sphere than its precursor of last year, and at the same time include all the latest and most recent improvements in gas lighting and heating.

The most important new feature of the Exhibition will be the coal smoke abatement section, which is being organised under the patronage of the Coal Smoke Abatement Society. No branch of modern hygiene deserves greater consideration than that dealing with the question of getting rid of the obnoxious products of combustion of coal, and it is with the object of drawing increased attention to this very urgent subject, and interesting those more directly concerned, that the Society are offering a prize of 50*l.* for the best domestic open grate which in the opinion of a jury, to be appointed by Sir William B. Richmond, president of the Society, is best capable of consuming its own smoke. The section will be situated in the centre transept, while a further space in the building will be set aside where exhibitors can show their various appliances in operation.

The gas engineering section, in which all the most up-to-date contrivances for the more efficient and economic uses of gas will be incorporated, will possess many unique inventions

of interest alike to the expert and layman. Street lighting, the illumination of large buildings, incandescent burners, recuperative gas-burners, gas-lamp fittings, vehicular lighting and all kinds of intensified gas lighting will all have space allotted for their respective illustration.

The latest advances in gas cooking and warming apparatus will be placed in position, while meters, from the most approved wet and dry systems to the now popular slot machines, will be on view. Cooking demonstrations and lectures will be given daily. Every description of gas plant and labour-saving appliance for the manufacture of gas will also be able to be inspected. A further section will, of course, be devoted to gas-engines, and also another for colliery exhibits of various coals.

The electrical section will also form a most important and prominent feature. It will be fully representative of this great and rapidly increasing industry, and embrace everything included in the gas section, viz. lighting, heating, power, and even cooking by electricity. Judging from the great exhibition of 1892, this section alone will no doubt put to the test the vast resources of the Crystal Palace and give them ample scope for their well-known organising abilities.

The promoters of the exhibition have secured the patronage of the Acetylene Association, which should insure this branch being particularly attractive. The period of the exhibition will embrace the chief holiday season of the year, and it might also be mentioned that it is the forerunner of an international display of a similar character to be held about the same time next year.

### AMERICAN CONDITIONS OF CONTRACT.

THE following are some of the clauses in the specifications of the Navy Department of the United States for the construction of a dock at Charleston, and will suggest the rigorous system which is now being established—at least on paper:—

The omission from the contract, or from the plans, specification, or other papers attached thereto, and forming a part thereof, of any work or materials required to secure the result set forth in paragraph 1, or the misdescription of any details of work the proper performance of which is necessary to carry out fully the intention above expressed, shall not operate to release the contractor from supplying all such materials and performing such work, but the same shall be fully and properly supplied and performed in the same manner as if fully and correctly shown, described and required in and by the contract,

and without expense to the United States in addition to the contract price.

The United States, by its civil engineer in charge of the work or other authorised representative, shall at all times have full control and direction of all work under the contract, and all questions, disputes, or differences as to any part or detail thereof shall be decided by such civil engineer or representative, subject only to appeal to the Chief of the Bureau of Yards and Docks.

The contractor shall employ only competent, careful, orderly persons upon the work, and if at any time it shall appear to the civil engineer in charge that any person employed upon the work is incompetent, careless, reckless or disorderly, or disobeys or evades orders or instructions, or shirks his duty, such person shall be immediately discharged from and not again employed upon the work.

If at any time the progress of the work shall, in the opinion of the civil engineer in charge, appear to have been such as to indicate that the work is not likely to be completed within the time allowed, he shall report such opinion to the Chief of the Bureau of Yards and Docks, who may in his discretion declare the contract null and void, without prejudice to the right of the United States to recover for defaults or violations.

This specification and the plans accompanying it shall be considered as supplementary one to the other, so that materials and workmanship shown, called for or implied by the one and not by the other shall be supplied and worked into place the same as though specifically called for by both. All detail plans that may be furnished subsequently in further amplification, as well as all instructions given by the civil engineer in charge that may be necessary to more fully indicate the intention of the specification and the above-mentioned plans, shall be followed and considered as though forming a part of the original contract. For all portions of the work the contractor shall submit the necessary detail plans to the civil engineer in charge for approval, unless otherwise directed by him, before proceeding with the work. These details shall conform to the letter and spirit of the specification, to any supplementary data and instructions, and to the general and detail plans already furnished the contractor. Plans shall be submitted to the civil engineer in charge in the form of tracings on cloth of Bureau of Yards and Docks standard sizes. These will be returned to the contractor either with blue prints of same stamped "approved" or to be revised as noted on the tracings. In the latter case the necessary corrections shall be made, and the revised

drawings submitted before proceeding with the work. Approval of plans will be of a general nature and will not relieve the contractor from errors or omissions that may exist therein.

The contractor shall check all plans furnished him immediately upon their receipt and promptly notify the civil engineer in charge of any discrepancies discovered therein. Figures marked on plans shall in general be followed in preference to scale measurements; but the contractor shall compare all plans and verify the figures before laying out the work, and will be held responsible for any errors therein that thereby might have been avoided. Large-scale plans shall in general govern small-scale plans. In all cases where dimensions are governed by conditions already established the contractor must depend entirely upon measurements taken by himself, scaled or figured dimensions to the contrary notwithstanding, but no deviation from the specified dimensions will be allowed unless authorised by the civil engineer in charge. The contractor will be held responsible for the lines and levels of his work, and he must combine all materials properly.

After the dry dock and all appurtenances relating thereto required by the contract are complete in all particulars, a board of officers appointed by the Secretary of the Navy for the purpose will examine and test the structures and all work included under the contract. All expense of such examination and test will be borne by the Government. After the board has reported that all work called for by the contract has been completed in every particular, according to the true intent and meaning of the specification, plans and contract, and after the report has been approved by the Chief of the Bureau of Yards and Docks, the contractor will be paid the remainder of the contract price. For a further period of six months after the approval of the report of the above board by the Chief of the Bureau of Yards and Docks the Government may test the dry dock and appurtenances under any working conditions which it sees fit, and if at the end of that time no bad workmanship, weakness, or other defect due to the fault of the contractor shall appear, the work will be accepted and the contractor and his bondsmen will be released from further responsibility; if such defects do appear, they shall be made good by the contractor without additional compensation.

Sheet 1 contains a record of borings made at various places on the Government property. This record is given for the information of bidders. However, the Government does not guarantee it to be correct in all particulars, or that the conditions will be found uniform, and it will not be responsible for

### CANADIAN LUMBER.

A CORRESPONDENT of the *Leeds and Yorkshire Mercury* writing from Vancouver says:—

The two trees of greatest economic importance in British Columbia are the Douglas fir, known in commerce as Oregon pine or red fir, and the great cedar, commercially called the red and sometimes the yellow cedar. The so-called Oregon pine is best known in England, but during the past few years the chief market has been British South Africa. The term Oregon pine is a characteristic commercial misnomer. In the State of Oregon it has been practically worked out, and the tree is not a pine at all, but a true fir. Botanically it is known as *Abies Douglassii*, and for its supplies of this invaluable timber the world must henceforth mainly depend upon the dense forests of British Columbia.

The coast ranges, the Cascade Mountains, the islands and the inlets on the mainland are its favourite habitat; and so vast is the acreage ascertained by the surveys of the Dominion Forestry Commission to be covered by this superb conifer, that even if the present annual output were trebled, and an allowance of 50 per cent. be made for destruction by fire—an allowance which experience shows it imperative to make—it would take sixty years to work out the ascertained acreage. At present, however, only about one-third of the limits of the province is taken up, and the remaining two-thirds offer a splendid field for the investment of British capital. It is estimated that the limits already taken up will be worked out by the companies now in operation in twenty years.

A common object adjoining a British Columbian farmhouse is a clump of Douglas firs standing in the open. In such a situation the whole character of the tree is transformed; the enormous limbs, draped in deep green, glossy fronds, droop to the ground, spreading a broader shade than the noblest of the forest-famed beeches of Denmark. But in the forest the tree grows without branches except at the top, yielding timber of immense size and strength, destitute of knots, and particularly suitable for bridge-building, house-building, wharves, piles, masts and furniture. No other timber is put to more varied uses. It is the material from which a great part of the bedroom furniture of America is made, and the chief timber used in the building of her wooden bridges and wooden sailing

ships. So dense are the forests that as much as 508,000 feet have been cut off one acre in Vancouver Island.

Next in economic importance to the Douglas fir is the great cedar—*Thuja gigantea*. The celebrated "big trees" in Stanley Park, Vancouver Island, are specimens of this species. Though of less lofty stature, the dimensions of the trunk frequently exceed those of the Douglas fir. It is a more ornamental wood, and is mostly used for interior furnishings, cabinet-making, doors and shingles. The manufacture of shingles, with which almost all the houses in Canada and the Western States are roofed, I shall describe later on.

I can merely enumerate the other forest trees of British Columbia. The yellow cedar, or cypress—*Thuja excelsa*—commands a great price as a furniture wood, owing to its close grain and high susceptibility to polish; it also forms a grand forest tree, 6 feet in diameter frequently; but its range is more restricted than that of the Douglas fir and the red cedar. Of commoner distribution and wider range, forming forests over great areas of the mainland still untouched, are the hemlock, the balsam fir, the bull pine, the tamarack or western larch and the broad-leaved maple.

My object in reciting these particulars is to show the field which exists for the investment of British capital in Canadian timber. The wood-pulp industry has come into great prominence in recent years and has conferred immense value upon the second-growth forests of spruce which abound in every province of the Dominion. Quite a large number of United States companies have engaged in this manufacture, which, owing to the existence of inexhaustible water-power everywhere, is highly lucrative, and some of the largest pulp-mills in Canada are owned by Americans. A similar remark applies to lumber factories and saw-mills, numbers of which have been erected by United States capital along the Canadian shores of Lake Huron and Lake Superior. The Dominion regulations for obtaining timber leases are as generous as the land settlement laws.

Some particulars about the Victoria Lumber and Manufacturing Company will illustrate the profitable nature of the business. This company for one initial payment of 5 dols. per acre acquired the license for twenty-one years to hew the timber of 122,000 acres. At the minimum computation, every acre will yield 30,000 lineal feet board measure—1 inch thick, 12 inches square—but it is nothing uncommon to get 200,000 feet upon an acre and sometimes the yield per acre is as high as 500,000 feet. The average selling price is 5 dols.

TO BOROUGH ENGINEERS, SURVEYORS, ARCHITECTS, &c.

## Massall's Patent Water Closet.

IMPORTANT IMPROVEMENT IN FLUSH-DOWN W.C.'s.

### ADVANTAGES.

Absolute and perfect flush guaranteed with 1½ gallons of water.

Excelsior and Rawdon Potteries,

per thousand feet, and this company's production last year was 56,000,000 feet—44,000,000 for export and 12,000,000 for home consumption. All this was Douglas fir—the so-called Oregon pine—this company reserving the cedar and other woods on its property for the present. The capital of the company is 1,000,000 dols., and I understand that an offer was recently made to buy out the company for 2,500,000 dols.

The saw-mills and loading wharves at Chemainus form one of the sights of Canada. Most of the machinery in a Canadian saw-mill is similar to that in England, but out here they have appliances for handling the rough logs which fill everyone with amazement. As a general rule the logs are brought to the mills by water, and a single jamb or raft is sometimes a mile in extent, and contains several millions of feet of lumber. Everything is done mechanically. The logs are raised from the water up an inclined plane, upon which moves an endless pulley, studded with steel teeth, and delivered upon a movable platform running parallel to a stupendous circular saw.

The monster log, dripping with brine, is slowly lifted up the gangway. As it projects through the doorway at the extremity of the bay, it seems to darken the spacious building, its huge bulk excluding so much light. No sooner is the log delivered upon the movable table than two immense grappling forks, like Titan hands of steel, sling it into position facing the circular saw, the lumberman pulls a crank, and the platform upon which he stands rushes madly forward, carrying the inert mass, automatically focussed to the nicety of a line against the teeth of the rotating steel. A deafening screech, the torture of a few seconds, and the "back" is severed from the log. The platform darts rapidly to and fro, the sawyers, strong of hand and of eagle eye, flit along with it. Never before in my life had I witnessed such strength and expertness. It is like men toiling incessantly upon some colossal moving shuttle, and in a few minutes' time the rough-barked log has been hewn into a score of planks, which the eye can hardly follow as they travel along to be still further split and dressed into deals.

At the work above described expert sawyers can earn 17. and upwards a day, but only smart and agile men are fitted for the task. Chinamen do most of the less responsible work—I am here speaking of Chemainus—and hundreds of them seem to be employed at this mill. The bays and timber yards are of great extent, and all the machinery is of the most modern description. At the end of the yard ships are loading the dressed timber—full-rigged 3,000-tonners, barques and four-masted schooners—and the day we visited the yard ships were

loading for Liverpool, Panama, Melbourne and the Cape. On the previous week vessels had cleared for Calcutta, Shanghai, Tien-tsin, the Cape, Liverpool, Sydney and Geraldton, in Western Australia.

Although the cedars and Douglas firs are the trees of greatest economic importance to British Columbia at present, and the coast forests where they grow are the only ones likely to be worked for some years to come, they by no means exhaust the forest wealth of this province. The big trees form a mere littoral fringe—a fringe, however, equal in area to Italy. In the central region between the Cascades in the West and the Rocky Mountains in the East, over an area 770 miles long and 300 miles broad, is a solid forest of spruce—black spruce and white spruce—the greatest preserve for the pulp industry which the world contains.

Moreover, this spruce forest passes beyond the bounds of British Columbia. It extends down the Peace River into the little-explored plains of Athabasca, its range being only bounded by the barren lands of the Arctic and the central wheat-growing steppe, which, as I have explained in previous letters, is destitute of forest vegetation. In the prairie trees are confined to the creeks and river bottoms, and are of inappreciable economic significance. The chief species are Manitoban poplar, or cotton wood, Western birch and tamarack.

Hitherto the staple article of the timber trade in Eastern Canada has been the white or Weymouth pine, the most useful of all pines for common lumber. In innumerable mills it is manufactured into structural woodwork for houses, flooring, doors, window-frames, &c. New Ontario will for years to come be the chief producer of this serviceable cheap timber for all the North American continent. Though the conifers—firs, pines, cedars and cypresses—constitute the preponderating factor in Canada's forest wealth, they are not the whole. The maple, the elm, the birch, the oak and the walnut diversify her sylvan scenery, often form extensive hardwood forests, and afford the materials for that important furniture-making industry to whose rapid strides in recent years I have already referred. In some of the Eastern mills one may see the whole process of manufacture from the raw log to the polished cabinet, from the floating jamb to the decorative furnishings of a drawing-room.

The harvest of the forest ranks third in value in the products of Canada, taking precedence of agriculture. Last year's exports, without including wood-pulp and many manufactured articles, were valued at 6,030,000. sterling, or 30,009,857 dols.

## THE WEEK.

It would be interesting to know by what principle the Irish Board of Works schedules buildings under the Ancient Monuments Protection Acts. The island abounds in ruins which are neglected, and it has been generally considered there must be extraordinary interest about any remains which acquire official control. According to the annual report of the Board, the church in Waterford, where some of Lord ROBERTS'S ancestors are buried, henceforth enjoys protection. It is reputed to date from 1240, and the structure consists of the nave, tower, transept and choir of the Franciscan church. The tower and transept are roofed, and the choir was in 1695 assigned to Huguenot settlers as a burial-place. There is no extraordinary architectural interest about the remains, and they were not thought to be worthy of becoming State property until Lord ROBERTS attained the climax of success. There is no objection to find a burial-ground in ruins gaining peculiar privileges; but it is tacitly understood that except in unusual circumstances an ancient monument is valued through its architectural or sculptural character rather than from the fact that some of the progenitors of a great man have found repose near the ruins. In Ireland there is a tendency to undervalue the work of old builders and artists and to exalt the associations attached to a spot, although in the majority of cases they rest on insufficient evidence. Waterford was mainly occupied by strangers; it was the Danish capital, and when the English came in the twelfth century it was among the few places which became loyal to the invaders. It has, however, few relics of its early possessors, and the Franciscan monastery is not a striking example of Mediæval art.

It has often been regretted that England is not possessed of natural gas, which in America has been utilised to an enormous extent as a cheap motive power. The gas required in Great Britain has to be distilled from coal. It is known, however, that England is not entirely destitute of gas, and if adequate search were made many sources would be struck. A company has been formed entitled the Natural Gas Fields of England, Ltd. A communication has been received from the company by the Heathfield Parish Council offering to light the eight standard lamps which are used for illuminating the village for eight months for a sum of 22*l.* 8*s.* The price is, therefore, about 55*s.* per lamp, and it includes supplying the light, which would have the latest form of incandescent burner, and keeping the lamp in condition. As the parish has not adopted the Lighting Acts the Council could not come to any official determination, but it was resolved to ask twenty-seven of the inhabitants to become guarantors, and to erect an additional lamp. The Sussex experiment will be watched with much interest by parish councils throughout the country.

The importance of CHARLEMAGNE as an historical personage is increased rather than diminished as the years pass. In his own lifetime he was regarded as a demigod, and his loyalty to the Church was accepted as a necessity. According to the legends he was not buried in a horizontal position within the church which he had erected in Aachen, or Aix-la-Chapelle. He was left seated with the imperial crown on his head, his sword by his side, and an ivory Book of the Gospels open on his lap. It may have been imagined that the king with the snowy beard would, when he exigencies demanded, reappear as the saviour of Europe. Although his actions as described by the poets and romance writers were superhuman, the account given by his son-in-law EGINHARD made him a familiar personage, who was a giant in size and strength, who bathed in the warm springs of Aachen, wore a garment of otter skins, gladly listened to songs about mythic heroes, who directed everything, the councils of State, the army, the training of priests and bishops, and the work performed by his

gardeners. At length he was canonised. When OTHO III., inspired by the contemporary enthusiasm, wished to verify whether the remains of the Emperor had not succumbed to time, he was able to see him still seated upright on a throne, his face bandaged and wearing a crown. Then came FREDERICK BARBAROSSA, who opened the grave in 1165 and ceremoniously carried what remained of the imperial bones and laid them in a new shrine, over which he hung a jewelled crown as a token of reverence. Archaeologists and historians are not all agreed about the incidents we have mentioned. CHARLEMAGNE'S body is now supposed to have been deposited in 814 in an old pagan sarcophagus, which was placed beneath the earth like an ordinary coffin. Above the grave a block of stone was raised of the same length as the sarcophagus, and which bore an inscription. Over it was a canopy, on which the figure of the Emperor was represented on a golden ground. The Normans when they entered Aachen destroyed the canopy and levelled the ground beneath it. OTHO III. sought for and found the grave and had it opened, but then closed. Subsequently, as we have said, BARBAROSSA in 1165 removed the bones to the position in which they are still thought to remain. Such are the latest conclusions of Professor BUCHKREMER on a subject which has excited much controversy. They dispel the legends, but it is likely they express the truth.

"OLD ST. PAUL'S" is still a name to conjure with, and HARRISON AINSWORTH was aware of the fact when he selected that title for one of his romances. The church was a connecting link between Roman London and times that were comparatively modern. But the greater part of the building which succumbed to the Great Fire was not more ancient than the eleventh century. The history of the cathedral has been made the subject of several books, but for the majority of readers we doubt if any of them is to be preferred to the "Portfolio Monograph" by Canon BENHAM, D.D., F.S.A., published by SEELEY & Co., LTD. The author has been in a position to utilise not only the labours of many investigators and the archives of the cathedral, which are better arranged than formerly, but the new processes of photographic presentation have enabled the pages to be illustrated by reproductions of the fine engravings by HOLLAR, as well as drawings in various collections, and, in addition, with portraits and copies of illuminated manuscripts relating to ecclesiastical functions. So many plates in a cheap book are unprecedented in our time. HOLLAR was a Bohemian, who was a protégé of the Earl of ARUNDEL. He held the position of drawing-master to the PRINCE OF WALES, the son of CHARLES I., and he served as a soldier in the Royalist ranks. Having escaped to Antwerp, he remained there for some years, and then returned to England, where he was employed on the illustrations for DUGDALE'S "History of St. Paul's," his pay being at the modest rate of 4*d.* an hour. His style was laborious, and he was more anxious to express details than to suggest pictorial effects. Not only views of the building are given by him, but representations of some of the most important monuments. In none of the views is the great steeple introduced, and the building therefore is deprived of a feature which at one period was a landmark in London and Westminster. There are one or two anonymous drawings of great interest. One shows the west front after the fire, in another we see JAMES I. and his court listening to a sermon at Paul's Cross, and the frontispiece is a compilation suggesting what the building was like when viewed from the river. There is some reference to the drawings by the late B. E. FERREY, who was a most conscientious draughtsman, but it is pointed out that in his representation of the spire he has not shown the corner pinnacles of the tower, which appear not only on the seal of the Chapter but in WYNGAERDE'S drawing. Canon BENHAM'S book is not confined to an architectural description. In St. Paul's many historical events were transacted which are narrated. The book therefore forms a worthy companion to the author's "Mediæval London," and both should have a place in the smallest library of the inhabitants of London and especially of the City.

PAINTERS' ARCHITECTURE: BREEMBERG.

### PORPHYRY.

THERE was no science like geology among the ancients, and in consequence the references to the materials employed in sculpture are often very vague. When, to take one instance, we hear of a vase, sarcophagus, or column being made of porphyry, we cannot imagine what was its colour or appearance. Many varieties of stones of an igneous class were believed to be porphyry. There are, for example, references to green, black, rose and mottled porphyries. Stones that would now be considered as syenite, serpentine, obsidian or basalt were formerly regarded under that generic name. From its endurance, and the colours some varieties presented, it was esteemed as a most valuable decorative material.

The Egyptians were long familiar with it, but the Romans do not appear to have become acquainted with it until the third or fourth century of our era. According to PLINY, the first blocks were sent from Egypt by VITRASIUS POLLIO, and it is supposed the material did not meet with admiration. WINCKELMANN was of opinion that the porphyry was not in blocks, but in the form of statues of the era of the PTOLEMIES. VISCONTI, on the other hand, maintains that the Romans were already cognisant of porphyry, and there was no novelty for them in the material. It is, therefore, not unlikely that the presents of VITRASIUS were works which he had ordered, and which from their archaicism were not judged to be in good style. From the quantity of porphyry discovered in the ruins of Palmyra it is evident that the Romans were able to appreciate so tenacious a stone. Another proof of admiration for it is to be observed in the attempt to make the draperies of white marble statues assume the semblance of porphyry by means of painting. Under ANTONINUS PIUS it was extremely valued. From its colour it was supposed to bear some relation with purple, and was consequently assigned to statues of deities, emperors and exalted personages. Sometimes it was used for draperies by sculptors, and sometimes for heads.

It is to be regretted that the introduction of the material should have been deferred until a time when Roman art, and especially sculpture, no longer displayed Greek influence. CONSTANTINE THE GREAT employed porphyry for sarcophagi. In the Vatican there are two remarkable examples. One sarcophagus served as a receptacle for the remains of his daughter, St. CONSTANTIA, the other for those of his mother, St. HELENA. The reliefs which embellish the exterior of the former are sufficient to indicate the condition of art at the period. The composition resembles some of those painted in the catacombs. We see winged amorini gathering grapes from branches or trampling on them in the wine-press. The figures are, of course, symbolic. There are also peacocks, which had ceased to be recognised as the attributes of JUNO alone. Porphyry is extremely difficult to carve, and allowance should be

made accordingly for the imperfections. But when all is taken into account the conclusion cannot be resisted that the early Christian sculptors were deficient in artistic skill, and with the most pliable materials would not have been much more successful.

The sarcophagus of St. HELENA is more ambitious in its ornamentation. It is suggestive of a battle-field, and may have some reference to the victory of her son over MAXENTIUS, which, as an important event in Church history, was one of the last works selected as a subject by RAPHAEL. After the battle CONSTANTINE introduced the labarum with a figure of the Cross as the army ensign, and the inscription "In hoc signo vinces." St. HELENA was credited with the finding of the Cross, and she could be easily supposed to have had some influence on the mysterious events of the battle. As the Rotunda of the Vatican was intended to be a shrine for the colossal porphyry vase, so the adjoining hall of the Greek Cross was formed to house the pair of immense sarcophagi. It is related that the restoration of the sarcophagus of St. HELENA occupied eight sculptors during ten years.

LEON BAPTISTA ALBERTI, the architect, was attracted by the difficulty of working porphyry, and endeavoured by research to discover the secret of the ancient operations. It is so hard as to resist strokes of the chisel, and it is only, as it were, in grains the surface can be abraded. According to VASARI's account, it was essential for the porphyry worker to have heavy hammers pointed with a diamond, and, what seems more extraordinary, the hammers must be soaked in the blood of goats. COSMO DE MEDICIS also investigated the subject, and he was reputed to have been able to harden the tools required by means of vegetable juices. He communicated his discovery to one of the Florentine sculptors, BAPTISTA DEL TADDA, who followed it with success. Modern scepticism will not accept the statements, and probably there was no other way to conquer the consistency of porphyry than patient labour. It is said, however, that MICHEL ANGELO, who was strong armed, was amazed at TADDA's facility in operating on hard stones. One instance of his skill was familiar to the Florentines. It was the porphyry statue of *Justice* erected by Cosmo to commemorate his victory over his countrymen at Montemurlo. The material was overcome to excess, for it was necessary to add a mantle of bronze in order to remove the appearance of slenderness which the figure presented.

Owing to the slowness of the operations, it was requisite to employ a large number of workmen on every example which had to be produced in porphyry. The vases of the Vatican and of the Naples Museum, and the statues and busts in the material, must have cost a sum of money which it is now difficult to estimate. It has been maintained by some archaeologists that the ancient sculptors may have been acquainted with processes, or rather appliances, by which manual labour was diminished. If, however, they had been conversant with a machine such as

the modern "rock-drill," it would be easy to imagine that a more delicate variety could be used for sculpture. But, so far as is known, the Romans trusted entirely to human hands, and it is not unlikely they possessed trained slaves who were capable to undertake the mechanical exercises of stone-working. From experiments carried out of recent years it has been concluded that porphyry is ten or twelve times harder than marble. In VASARI'S time the saws in use were without teeth, and were formed of copper. It was likely that sand or emery was an auxiliary, and the saw merely kept the grains in motion.

GAUTIER in one of his poems recommends the sculptor to work only on the hardest and most enduring materials, and no doubt it would be well to confer as much immortality as possible on a work of art. It is remarkable, however, that such materials as porphyry, or basalt, never seem to have been in favour with great sculptors. It is true we have Egyptian figures over which time seems to be deprived of power. The style of execution cannot be considered as more than conventional, and the characters of the figures are in keeping with the material. No ordinary individual can feel any sympathy with the kings or deities who seem to be removed beyond the region of human existence. The delight with which the portrait in wood of the old overseer was received suggests the failure of the great works in basalt, granite, or porphyry to appeal to the minds of living men. We have the authority of HERODOTUS for the existence in his day of wooden statues, and, judging from the effect produced by the examples which have survived, we may with some reason conclude that the statues which the old Egyptians loved were not those made, so to speak, for eternity. There is a limit in calculating time, and men do not care to see works which appear as if not destined to pass away.

It is doubtful whether any of the statues of porphyry which exist can be considered as the production of Greek sculptors, unless we apply that name to men who were compelled to labour in Rome under unfavourable conditions. If the legends are of any value, Greek sculpture was for a long period embodied in figures of wood. We cannot suppose that the works in bronze were other than castings, or it may be a collection of beaten plates rivetted together. Marble, ivory, gold seemed to be enduring enough for the sculptors of Greece. No doubt the hardest stones were selected for glyptic works, and Greek gems are often as remarkable as the large statues. But we should remember that gems were constantly handled; they were utilised for personal adornment, and the minuteness of the details if worn away would cause the whole to lose its character. It is idle to assume the Greek sculptors were ignorant of the materials made use of by the Egyptians, but they seem never to have been eager to toil on stones like porphyry. It was felt no doubt that an over-rigid substance was not well adapted for the representation of action; for although the bronze of Syracuse could vie in endurance with any of the porphyries of Egypt, it was realised that a bronze statue was no more than a copy of a model in clay. The passage of PLINY which has been the subject of much comment is certainly suggestive of the fact that in his time the connection between bronze figures and the clay originals was not overlooked. He tells us how "LYSISTRATUS of Sicily, brother of LYSIPPUS, first of all expressed the image of a man in gypsum from the whole person, and improved it with wax or colour spread over the form. He first began to make likenesses, whereas before him the study was to make persons as beautiful as possible. He also invented expressing effigies from statues, and this practice so grew that no statues or signs were made without white clay. From which it would seem that this science or process was older than that of casting in bronze. The most famous modellers were DAMOPHILUS and GORGASUS, who were also painters, and who decorated the Temple of Ceres at Rome with both branches of their art." In this passage it is evident that PLINY, and probably the amateurs of his time, formed a mental vision of a statue in its original condition, which was as near living reality as possible. In fact, the old belief was that the statue was in the block of marble, and was made visible by the removal of the matter concealing it. With a material so tenacious as porphyry such a belief was hardly possible.

#### MODERN SURVEYING.\*

THE failure of the plans of the proposed Brighton railway to sustain scrutiny before the examiner on standing orders was enough to disquiet a great many people connected with works on a grand scale. The errors no doubt arose through the use of Ordnance Survey sheets of old date. But the system must have been at fault by which such plans were deposited. It is always expected that plans and sections of railways are to correspond, and when we see on plans objects which do not exist, as well as the omission of important objects, it is evident that the two were not compared, and it may be assumed the sections are also erroneous. The plans of the Brighton line were evidence of incapacity to produce extensive surveys on a small scale. The Land Registry report has also demonstrated that plans of houses and other buildings on a comparatively large scale are produced no less carelessly. The conclusion to be drawn is that modern surveying is the work of untrained men who are ignorant of the methods of measurement by which errors are obviated.

There can be little doubt that many of the errors arise from the too general use which is made of the maps of the Ordnance Survey. Great care has no doubt been taken with that work, but indiscriminate copying of the sheets is a risky process. Details are being constantly changed, and the maps in consequence become obsolete. The triangulation no doubt was laboriously laid down and measured. But it is quite possible that in many cases it has not the accuracy which is desirable. This will be seen in cases where areas are given and which will not always agree with computation from the maps. In the case of plans for Parliamentary purposes, the errors derived from a 6-inch Ordnance map may not be serious. But to follow the 25-inch maps for working plans means liability for inaccuracies, and may cause the outlay on works to be larger or smaller than would be the case with an exact survey. This would mean a loss either to the railway company or to the contractor. Surveying must, we suppose, submit to the same economical law as many varieties of business, or, in other words, must be produced at the cheapest rate. By the employment of the Ordnance Survey time and trouble are spared. But the reliance on maps which were not intended to become the basis of contracts is a departure from old principles which produced satisfactory results.

The same spirit is also seen in the efforts to substitute photography for measurement. Remarkable views may be obtained in that way, and for dealing with immense tracts of lands in new countries photography can be turned to account. But the legal aspects of the arrangement do not appear to have received any consideration. From the earliest time it has been recognised that a surveyor's plans are documents which can be supported by oath in a court of law. Indeed, among litigious people the surveyor is a frequent attendant at trials. But can anyone believe that an English judge or jury, with no more than a photograph of a disputed property before them, would give as much reliance to it as would be placed on a plan produced by a surveyor who testified to the accuracy of every line in it? One would be an approximation to the truth, the other would be as true a representation as human intelligence can produce. When they are bound to plans which are simply modifications of the Ordnance Surveys, experienced contractors are too shrewd to be indifferent as to the degree of confidence, with which these can be accepted, and in such cases the allowances for contingencies are likely to always be greater than in cases where plans which have been prepared in the legitimate way are employed.

It is necessary, however, for the young surveyor to understand that the days when a chain, a few off-set staves and a pole or two were sufficient to produce extensive plans are over. That method was not always successful. It often failed in dealing with winding rivers and in surveys of the extent of an ordinary parish. The English tithe maps and the Irish Down Survey are evidence of failures of chain-

\* *Surveying as Practised by Civil Engineers and Surveyors*. Including the setting-out of works for construction and surveys abroad, with examples taken from actual practice. Intended as a handbook for field and office use. Also as a text-book for students. By John Whitelaw, jun., A.M.Inst.C.E. London: Crosby Lockwood & Son.

work which have caused a great amount of inconvenience to the public. Prior to the employment of the theodolite for taking angles, the area which the ordinary surveyor was able to map was likely to be incorrect unless the work was carefully tested. There are plans which have withstood all attempts to prove them to be inaccurate, and they deserve to be considered as examples of scientific geodesy conscientiously produced under many difficulties. The theodolite, it should be remembered, was costly, and was rarely employed by ordinary land surveyors, who preferred more simple instruments for determining angles.

The invention of the theodolite caused a revolution in surveying. It was a development of earlier instruments, such as the astrolabe and the quadrant, the latter being in use until the end of the eighteenth century. A horizontal circle was also devised in Denmark, and used for large surveys. To RAMSDEN, the English optician, we owe the theodolite. It was first employed in the operations for the connection of the observatories of Greenwich and Paris. Three were made by him for the trigonometrical survey between 1787 and 1799. TROUGHTON & SIMMS and other opticians introduced improvements from time to time, and the ordinary theodolite now in use appears to have little connection with that which was figured and described in the Philosophical Transactions towards the close of the eighteenth century. Without the theodolite railways could not have been so accurately or quickly laid out. It may be said with truth that the theodolite is more generally associated with such operations than with ordinary surveying. In some kinds of surveying, as in the case of large towns and cities, the theodolite is not easily dispensed with.

The character of Mr. WHITELAW's book can be judged from the introduction of the theodolite in the second chapter. The science of surveying, as it was known to the old-world practitioners, is explained in the first chapter. Other instruments employed in surveying operations, and especially in levelling, are also described. Examples of working plans and sections are given. The latter, we think, could be improved if, as the gradient or formation level is commonly drawn in red ink, the levels relating to it should also be in red, and it is more convenient if they are placed opposite the figures indicating the level of the surface on the other side of each ordinate. The depths of cuttings and embankments will be more appropriately disposed if they are written on or near the parts to which they relate. During the execution of works the parts between the gradient and the surface line become the most important, and it is unnecessary labour, besides offering a chance of error, to have to seek the depths and heights at foot near the datum line. The section given of the Tolley tunnel is interesting, for the different varieties of material to be encountered are defined. Information of that kind is not always forthcoming, and we doubt if contractors care to possess it. There is less left to chance, which an English contractor generally believes will be favourable to him, for a much higher rate can be charged when the faults, springs and changes of strata are unknown. Indeed, it seems to be difficult, if not impossible, to determine the geological character of a tunnel which is 6,229 yards in length without costly preliminary works. The setting out of this tunnel was performed with so much accuracy that "when the headings met the difference between the centre lines of the two headings was found to be  $4\frac{1}{2}$  inches and the difference between the levels was  $2\frac{1}{2}$  inches." The description of the means adopted in this case reveals the perfection which is now attainable. With such examples the truth of the saying, "Science is measurement," becomes manifest. The publishers have already issued useful books on surveying, and the addition of a new volume would probably not have been undertaken if it had not been found that a demand exists for a certain class of information which it was necessary to supply.

One of the new appliances is the tacheometer, used for telescopic ascertaining of distance and height. It is found to be of great utility in preliminary surveys for roads and railways. We are told that "on the Continent the tacheometer is supplanting every other method of making preliminary surveys for public works, especially among Italian, French, German and Spanish engineers." The employment

of the tacheometer may be only partial in this country where the Ordnance Survey maps are available for projects in an embryo state; but for engineers who have to investigate countries which are not so favoured the instrument becomes a necessity.

Land surveying in its fullest extent forms the subject of about two-thirds of the volume. A portion is also assigned to marine surveying. There are in addition chapters on such work as is required in jungles, forests and the trigonometrical surveys which are usually undertaken after much deliberation by public departments. There is also considerable incidental information such as the following concerning the surveying regulations in the Australian colonies:—

In the Australian colonies almost every branch of the civil engineer's profession is practised directly under the control of the State, and more especially those branches in which surveying plays an important part. Surveys under the control of the Departments of Lands and Survey are performed by salaried officials, or by those who are "authorised" on either Crown lands or sold lands which will be brought under the operation of the Transfer of Lands Statute. Plans of surveys made by "unauthorised" persons are not officially recognised. All "authorised" surveyors must comply with the regulations issued as departmental instructions or bearing the force of an "Order in Council." Each colony is divided into survey districts, each of which is under the control of a salaried inspecting officer. These, again, are subdivided into divisions, and each is assigned to an "authorised" surveyor to whom orders for departmental work are sent. The "authorised" surveyors are not salaried, but are remunerated by fees fixed by regulation, and they are removable at the pleasure of the Surveyor-General. When a vacancy occurs selection is made from those holding a certificate of competency obtained by examination. The inspecting officer of each district makes periodical inspections of "authorised" surveyors' work in the field, their instruments, field books, &c., and certifies to all accounts. Inspecting surveyors are under immediate control of the Surveyor-General. The higher classes of surveying, including minor triangulation, are performed exclusively by staff officers; the ordinary sectional or block surveying and laying out of towns and roads is performed by "authorised" surveyors. The system of examination and supervision is so complete that a very high standard of efficiency has been attained.

It will be seen that Mr. WHITELAW does not confine his attention to English work alone. The stay-at-home surveyor can only have a limited field before him. The book is adapted to the new conditions of English life—that is to say, it will meet the conditions of the regions which are now accepted as being in reality as well as in name parts of the Empire. At home or abroad Mr. WHITELAW's "Surveying" will be found a profitable guide.

#### THE GLASGOW ART GALLERIES.

THE exhibition of pictures, sculpture, &c., in the new fine-art galleries belonging to the Corporation was formally opened on Saturday. It will be remembered that the galleries formed a great attraction during the international exhibition held at Kelvingrove last year. The exhibition of pictures, British and foreign, brought together at that time, says the *Glasgow Herald*, was the most brilliant ever seen in Scotland. That memorable collection was soon returned to the owners after the exhibition doors were closed. Since then the permanent art treasures of the Corporation have been removed from Sauchiehall Street to the new building. The contents of the Kelvingrove museum have been similarly transferred. The valuable Corporation collections will also be recognised as having benefited greatly by removal from the unsuitable rooms in Sauchiehall Street to the new galleries. The pictures especially are now seen to great advantage in respect of fuller light and air and space. In the grand central hall we have the elaborate pendent brass lamps, with their myriads of lights hanging from the arched roof, and reflecting the rays of light from lofty windows. There is, however, the added decoration of the fine organ. East and west from the main hall extend the courts, which are also very bright in appearance. The central hall is devoted as before to sculpture. A number of pieces are in marble and some in bronze; the majority, however, are careful casts taken from famous works. One of the finest pieces is Flaxman's famous statue of Pitt. Other works were acquired at the exhibition of 1888 and at the exhibition last year. Included in these are two outstanding pieces by Rodin, the distinguished French artist, his "John the Baptist" and "The Burgher of Calais."

The eastern division on the ground floor is devoted to natural history science, the southern saloons being occupied with zoological and mineralogical collections. The corner pavilion is given over to the remains of recently extinct animals. The central court contains the mammalian collection, together with the large assortment which the Corporation now possess of osteological specimens. In the central saloon in the same division are shown birds, reptiles and lower forms of the animal kingdom. In the corner pavilion beyond is a collection illustrating British zoology as well as local specimens. The south transverse saloon holds the ethnological collection.

Crossing the grand hall to the north-west court of the corresponding division the shipbuilding and engineering industries and architectural subjects are reached. A large number of very fine models of recently-constructed vessels are here shown, besides an important historical series of vessels illustrating the development of shipbuilding, especially on the Clyde. The general technological collections which were formerly in Kelvingrove Museum occupy the saloon on the south. The corner pavilion adjoining is given over to metallurgical industries. In the transverse saloons are engineering models, which give a general idea of the industry. The north-west corner pavilion has been allotted to the historical memorials and remains of Glasgow. There is a large series of pictures of the city at various periods which the Corporation now possess, and which were painted by Crimean Simpson, Thomas Fairbairn and William Small, besides a very large number of deeply interesting relics of Glasgow. General antiquities and personal relics occupy the adjacent saloon. In this section there is a large gathering of stone and bronze implements from Scotland, America, Egypt and Somaliland. General antiquities range from remains from ancient Egypt, Greece and Rome down to obsolete implements of modern times. There is also a fine collection of pottery and other ancient manufactures, remains of the Incas of Peru and the old Mexicans and primitive American tribes.

The galleries in the upper floor of the buildings are entirely set apart for the art collection. The gallery on the north-west side contains ancient pictures, while in the corresponding saloon on the south side are exhibited the works of modern and living artists. Beginning with the old pictures, in the first saloon are hung the famous Flemish works, which are the property of the Corporation. The corner pavilion and transverse gallery are given over to the Corporation's pictures by old Dutch masters. In the north-west pavilion and adjoining saloon are the works of early Italian painters. Most of these pictures are pretty well known to habitués of the old Corporation galleries. The balconies are entirely given over to collections of art objects, and some of these may be singled out. There is a case of magnificent old English silverware, lent by Mr. John A. Holmes, of Paisley, who has included in the collection the famous silver Tudor cup which he acquired last summer at the Dunn-Gardner sale for 4,000*l.*, and many other magnificent examples dating from the fifteenth to the eighteenth centuries. In the first of the south art galleries are pictures by Scottish artists. Another gallery is filled with pictures principally of the English school, and here is also to be found the exceedingly valuable collection gifted by the Messrs. Reid, of Hyde Park, which is treated as a group apart, as indeed, in one of the other galleries and a corner pavilion, is a series recently acquired under the bequest of Mr. Thomas B. Smellie.

A distinctive feature of the exhibition is a loan collection of eighteenth-century British and French pictures, which has been brought together in the large transverse gallery and adjoining pavilions. The British section is one of great beauty and importance. Indeed, in quality, if not numerically, it recalls the pictorial triumphs of last exhibition. Portraiture is in the ascendant, and when it is mentioned that there are examples of Reynolds, Gainsborough, Raeburn and Hoppner it will be seen that there is much to interest and instruct. Amongst other noblemen and gentlemen to whom we are indebted for these treasures are the Duke of Westminster, Lord Tweedmouth, Sir Charles Tennant, Bart. of the Glen, Sir Samuel Montagu, Bart.; Mr. R. H. Brechin, Mr. William Beattie, Mr. Arthur Kay and Mr. R. B. Don. Raeburn is strongly in evidence. Perhaps the finest examples of his art are the portraits of Alexander Campbell and Mrs. Campbell. The lady wears a white dress, over which is a red robe. Soft brown hair curls to the forehead. The carnations of the winsome face are exceedingly fine. This is Raeburn at his best. Other fine portraits by the master are of Thomson of Duddingston (who may be regarded as the founder of the Scottish school of landscape), of Mrs. Oswald and of himself. Three examples of Gainsborough are interesting as well as important. One is in portraiture, the Ladies Erne and Dillon; another is a landscape, "Watering Horses," which for brilliance of colour and free handling is unsurpassed in the exhibition. The third canvas bearing his name is a seascape, full of light and life and atmosphere. How broadly and simply it is treated—

how charming and finished its art. Two exquisite presentations of child-life are by Reynolds—a quaint little girl standing demurely with clasped hands and enveloped in golden light, and "The Dead Bird," a child lamenting the loss of her favourite. Other works bearing the same name are portraits of Lewis, the actor, and Mrs. Billington, who, if we remember aright, also trod the stage. A magnificent example of Hoppner may be studied in "The Sisters," two young ladies in al-fresco dalliance. The arrangement is extremely felicitous, the landscape more than a mere suggestion. Romney is represented, amongst other things, by a charming Lady Derby and a half-length of Lady Holte, the latter the property of the Corporation of Birmingham. Mr. Robert Ramsey sends on loan "The Cellarman," attributed to Jean Honoré Fragonard. It is a small work of great delicacy and charm, but it is not at all in the style of the Frenchman. We should rather suppose it to belong to the Dutch school. Sir John Stirling-Maxwell, Bart., sends a number of Blake's drawings, quaint and weird conceptions, including a great oblong, "The Canterbury Pilgrims," "Adam," "Nebuchadnezzar" and "The Last Judgment." The technique is in some passages admirable, while the drawing is frequently defective. Blake was a profound dreamer. The French eighteenth-century pictures have been lent by Mr. Reginald Vaile, of London. One need not hesitate to express the opinion that the most accomplished canvas in this collection is that of Jean Marc Nattier, who paints the Countess of Newbourg and her daughter. The Countess is a handsome woman in figure and complexion. Her features are repeated in those of her daughter, whose sweet oval face is lighted up by dark, luminous eyes. The colour is refined, the arrangement charming. "The Unhappy Family," by Greuze, is not pleasant, either in colour or in subject. Over it is "The Beggar Boy," also by Greuze, a much better picture of its kind. It is delicate in tone and makes pathetic appeal. "The Two Sisters" is also by Greuze. J. S. Chardin's head of a peasant girl, wearing a straw hat, is one of the gems of the exhibition. "The Dance," by Nicholas Lancret, is in the style of Watteau, and reflects the pastoral gaiety of the age in which he lived. Two Watteaus in his familiar manner are shown, and there are several canvases by his pupil, J. B. J. Pater, and a Fragonard, "The Wagered Kiss."

It will be remembered that a collection of pictures by Jean Honoré Fragonard entered into the last Guildhall show in London. They were the property of the American millionaire, Mr. J. Pierpont Morgan, and were assigned a special room. Glasgow has been similarly favoured by the man of many dollars, and here the pictures have been brought together in one of the pavilions, where, it may be added, they are better spaced and lighted than in London. Fragonard, who died at the beginning of last century, was a decorative painter, as Mr. Morgan's collection sufficiently attests. He painted the open-air elegancies of the French life of his time, making much of graceful costume and deportment, and sometimes indulging in the representation of indelicacies which nowadays would give offence. We hasten to say, however, that no charge of this kind applies to Mr. Morgan's collection. It is illustrative in a series of panels of the romance of love and youth. "Love and the Maiden," "Love's Folly," "The Love Letter," "Love the Assassin"—subjects such as these indicate the manner in which the artist develops his theme. He does so with much delicacy and skill—paints flowers and trees and luxuriant foliage with appreciation, and introduces symbolism that is always helpful in interpretation.

We have to congratulate all who have been concerned in the arrangement of the galleries and the hanging of the pictures. Superintendent Paton, Curator Rennie, Mr. Downes and Mr. Wm. Young may well be satisfied with the issue of their long continued labour.

#### THE LATE JOHN FAED, R.S.A.

THE death is announced at Gatehouse, in the Stewartry of Kirkcudbright, at the advanced age of eighty-two, of Mr. John Faed, R.S.A., who as an artist was well known throughout Scotland. Three or four months ago, says the *Scotsman*, he became seriously ill, and it was seen some days ago that the end of a long life was approaching. No later, however, than the 18th of this month he wrote a holograph letter, gifting to the Royal Scottish Academy one of his later pictures in oil, called "The Poet's Dream." The picture arrived, but the Council of the Academy had not an opportunity of thanking the donor for his generous gift, though that was done informally by Mr. George Hay, the secretary. The subject of the picture is a poet stretched on the high bank of a lake, across which, in the sky, the visions of his fancy take shape before him. It is painted in clear tones, and finished with much care. John Faed, who was born in Galloway, was the eldest of a large family, several of the members of which ros-

to distinction in the world of art. His father, who was a miller and engineer, was a cousin of General Sir George Faed, K.C.B., who fought at Waterloo. Faed showed early his bent towards art. He taught himself amid many early discouragements; and, having seen a few miniature portraits on ivory, he determined to be a miniature painter. At the early age of twelve—he had left school a year before—the boy artist is said to have perambulated the towns and villages of Galloway practising his art, and getting patrons among the aristocracy of the district. In his twentieth year the young artist went to Edinburgh, ostensibly to attend the art classes at the Mound, but he did not remain long in them, and established himself as a miniature-painter in the city with the greatest success. He was acknowledged to be one of the leading artists in Scotland in this dainty branch of art until he gave it up over forty years ago. One of the incidents of the early forties was exceedingly creditable to him. Having gained a good footing himself and made some money, he sent for his brother Tom, then a draper's apprentice in Castle-Douglas, to come to Edinburgh to study art. He did so to some purpose, and became a painter of homely genre, whose works are still immensely admired. His youngest brother James followed later, and turned out one of Scotland's leading line engravers. Of the Faed family only Mr. James Faed and Mrs. Walthew (Susan Faed), herself an artist also, now survive. So early as 1841 Mr. John Faed began to exhibit in the Royal Scottish Academy, and for many years thereafter his name was seldom out of the catalogue. He commenced to paint and to exhibit pictures in oil as well as miniatures, and in 1847 he was elected an Associate of the Royal Scottish Academy—full membership coming in 1851. He found his subjects in Burns, in Scott, in Shakespeare, in history and in the homely life of the country—among other noteworthy works by him being "Boyhood" (1850), "The Cruel Sisters" (1851), "The Cottar's Saturday Night" (1854), "Reason and Faith" and "The Philosopher" (1855), "The Household Gods in Danger" (1856), "Job and his Friends" (1858), "Boaz and Ruth" (1860). Among pictures of this period may also be noted "The Raid of Ruthven," "Rosalind and Orlando," "Olivia and Viola" and "Shakespeare and his Friends at the Mermaid Tavern"—a companion picture to his brother Tom's work—"Scott and his Friends at Abbotsford." These pictures were praised by the critics and found a ready sale. In 1862 Mr. Faed removed to London, where he resided for the next eighteen years. While there he regularly exhibited in the Royal Academy such works as "Catherine Seyton," "Old Age," "The Stirrup Cup," "John Anderson my Jo"—a particularly beautiful little example of his art—"Old Mare Maggie," "After the Victory," "The Morning before Flodden," "Blenheim," "In Memoriam," "Goldsmith in his Study" and "The Old Basket-maker." One of his pictures, "The Wappinschaw," which was shown in the Royal Scottish Academy, was purchased for 1,000*l.* or 1,200*l.* by Mr. James Baird, of Cambusdoon. His diploma work, which hangs in the National Gallery, was "Annie's Tryst." The influence of Mr. Faed's art as a miniaturist was seen in his oil-pictures. He was a careful and precise painter, could compose his pictures so that they told their story well, was careful of his drawing and painted in pure, if a trifle hard, colour. In 1880 Mr. Faed retired to his native Gatehouse, where he spent, in quiet retirement, and surrounded by sympathetic neighbours, the evening of his days. Since settling in his native place, he painted several beautiful views of the valley of the Fleet, one of which he presented for the adornment of the Gatehouse town hall, and to the year 1883 belongs "The Poet's Dream," which, as stated, he presented to the Royal Scottish Academy. Mr. Faed was in his youthful days in Edinburgh an officer in the Artists' Company of the City Volunteer Artillery, of which the late Sir Noel Paton was captain. In private life he was warm-hearted and generous, and greatly respected by all who knew him. His wife, an accomplished woman, who had been a great helpmeet to him throughout life, died about four years ago.

### BOSHAM CHURCH.

AN appeal has been made by the Rev. K. H. MacDermott on behalf of one of the most ancient and interesting churches in England—the parish church of Bosham, in the county of Sussex. Built on the site of a Roman basilica, portions of which still exist and are visible in the bases of the present chancel piers, the church has an architectural and historic interest without a parallel. The nave, tower and part of the chancel were built by the Saxons, who used for their work many of the old materials that had previously formed part of the Roman building. In a corner of the nave Canute, who had a dwelling-place at Bosham, buried his young daughter, and the stone coffin containing her remains was discovered in 1865 in the exact spot indicated by tradition. After Canute, Harold lived there, and in the famous Bayeux tapestry, worked by Matilda, wife of William the Conqueror he is depicted

entering Bosham Church before his fateful journey to Normandy. In the twelfth century Bishop Warlewast of Exeter founded a college at Bosham, and for the accommodation of its members he enlarged the church by adding the aisles and lengthening the chancel. In the thirteenth century Herbert de Bosham, the great friend of Thomas à Becket, was buried in the church of his native place. It was at Bosham that Wilfrid, in A.D. 681, first preached Christianity to the South Saxons, although we learn from Bede's "Ecclesiastical History" that Wilfrid found already established a small monastery, in which an Irish monk named Dicul, with five or six brothers, served Our Lord in poverty and humility. This historic edifice is now in sad need of renovation, and as the parish itself is neither large nor wealthy, friends outside are invited to help. The work to be done, which includes the reshingling of the spire, rehanging of the bells, repairs to roof, ceiling and walls, is absolutely necessary for the preservation of the ancient fabric, and the vicar believes that Englishmen all over the world will gladly help rather than allow so unique an English historic monument to fall into decay. The work will be carried out with the most careful regard to the preservation of the many ancient architectural features and under the superintendence of competent architects. It is estimated that the sum of 2,500*l.* will be required to complete the work, and donations are earnestly solicited, and will be gratefully acknowledged.

### SOUND-PROOF PARTITIONS.

THE subjoined report has been prepared by Professor C. L. Norton, on the use of "Sound-proof Partitions":—

The subject of partitions for fireproof buildings is one which has led to much investigation, especially by the New York City Building Department.

When it is desired to make a partition which shall be reasonably sound-proof, it is apparently necessary to diminish somewhat the absolute incombustibility of the partition, though to a less extent than was supposed.

The following account of tests made for Mr. Edward T. Barker, architect of the dormitories of the New England Conservatory of Music, will show the relative values of some of the typical partitions of sound-proof separations between rooms:—

There were built upon the concrete floor of the B. & A. warehouse, East Boston, five rooms 7 feet square, whose side walls were made of the several partitions. The rooms were built upon a floor of the same kind as that which is to be used in the buildings for the students of the Conservatory, for which the results of these tests were especially desired.

The rooms were built near one another on the fifth floor of the warehouse in a large loft or room about 50 feet by 70 feet long and 9 feet high. The ceiling of each room was the under surface of the concrete ceiling of the large room. Each room had a floor of two thicknesses of  $\frac{3}{4}$ -inch floor-boards with two thicknesses of Cabot's sheathing quilt between the floor-boards and the concrete slab of the main floor. On one side of each room was a door with a glass panel, the door-jambs being faced with soft felt, and the bottom of the door was fitted with a stop "weather-strip," operated when the door closed, making a tight joint at the bottom.

The side with the door will be referred to as the front in the following description:—

Room A.—This room was submitted by the National Fireproofing Company, and its four sides were made of terracotta blocks. The front and back walls were made of blocks 4 inches thick; the sides of 2-inch and 3-inch blocks. After the blocks were in position the room was given two coats of plaster inside and out.

Room B was submitted by the Keystone Block Company and its four walls were made of the blocks of the Keystone, material of the nature of plaster-of-Paris with a fibrous bond. The front wall was of blocks 4 inches thick, and the left side was of blocks 2 inches thick, the back of blocks 3 inches thick, and the right side of two 2-inch blocks with a 2-inch air-space between them. The entire room was given two coats of plaster inside and out, except the front, which had no plaster on the outside of the blocks.

Room C was submitted by the Sackett Wall Board Company, and was built of Sackett plaster board  $\frac{1}{2}$  inch thick, wired upon both sides of 3-inch steel channels. The channel truss or studs of the back and right sides were wrapped with felt about  $\frac{1}{2}$  inch in thickness before applying the plaster board. The Sackett plaster board is a composite board of alternate layers of paper and plaster, the whole being about  $\frac{1}{2}$  inch thick. This room, like the other, was plastered inside and out, but to a slightly less thickness.

Room D was submitted by J. Russell & Co. and was of a more complex construction. The left side was a solid partition of metallic lath and plaster. The  $\frac{1}{2}$ -inch steel ties were spaced 16 inches on centres, metal lath was applied to one side only of the ties and then plastered to a thickness of 2 inches. The

rear wall was built upon two rows of  $\frac{7}{8}$ -inch studs staggered. Between them were placed one thickness of waterproof paper about 1-32 inch thick, and metal lath was wired to both sides of the row of studs and given two coats of plaster. The right side was of the same construction, with a layer of  $\frac{1}{8}$ -inch felt between the two thicknesses of waterproof paper. The front wall was of metal lath on two rows of staggered studs, with Cabot's seaweed quilt between the rows of studs.

Room E was submitted by Mr. Samuel Cabot, and was wholly of metal lath and plaster double partitions, with the space between the lath filled with Cabot's sheathing quilt. The front and left sides contained three thicknesses of quilt, and the right side and rear two thicknesses. The quilt was placed between the studs and the metal lath, and where three thicknesses were used, one was between the row of studs as well.

The rooms had been vigorously dried for several days, none longer than a week, but the whole building was so damp and the time so short that no considerable part of the plaster and none of the interior portions of the partition were dry. The Sackett board room was the driest and Cabot's was the least dry.

The preliminary trials showed so great a range of efficiency of the several constructions that the microphonic apparatus, which was designed to make rapid comparisons of sound intensity possible, could not be used. Reliance had to be placed wholly on listening with and without a felt-mouthed stethoscope at the outside of the partition to sounds of various quality and intensity from within. The notes of the piano, violin, cornet and the human voice were carefully tried throughout wide ranges of pitch and intensity. The performers and the instruments were interchanged, every possible chance of unfairness due to the variations of intensity in the sounds used was eliminated. Of course no interchange of the positions of the room was possible. No electrically-driven tuning-fork could be used for producing sounds of constant loudness. The insulating property of some of the partitions was so good that even the blare of a cornet or the overpowering tones of an Italian tenor, drawn from the ranks of the labourers on the building, could be heard through the partition except by careful listening within a few inches of the wall.

After much consideration the writer has given the following ratings to the different partitions. The order of their standing upon the list indicates their efficiency as compared with those above and below them.

No.	Room.	Side.	Scale.	Composition.
1	E	Left	100	... Cabot's quilt, 3 thick + metal lath.
2	E	Right	95	... Cabot's quilt, 2 thick + metal lath.
3	E	Rear	95	... Cabot's quilt, 2 thick + metal lath.
4	C	Rear	85	... Sackett board, 2 felt on $\square$ s.
5	C	Left	85	... Sackett board, 2 felt on $\square$ .
6	C	Right	80	... Sackett board, 2 felt.
7	D	Rear	75	... Metal lath + paper.
8	D	Right	75	... Metal lath + paper + felt.
9	B	Right	60	... Two 2-inch Keystone block with 2-inch air space.
10	A	Rear	50	... 4-inch National terra-cotta blocks.
11	B	Rear	50	... 3-inch Keystone blocks.
12	A	Right	45	... 3-inch National terra-cotta blocks.
13	B	Left	40	... 2-inch Keystone blocks.
14	A	Left	40	... 2-inch National terra-cotta blocks.
15	D	Left	30	... 2-inch metal lath, solid plaster.

Nothing more is to be inferred from the numerical efficiencies than that the first partition is about three times as good as the last, and that the numerical interval between any two partitions on the list merely indicates the order of magnitude of the difference between the partitions.

The partitions making up the rooms submitted by Samuel Cabot and the Sackett Wall Board Company were the most efficient; but it is distinctly to be borne in mind that no other room had so easy a test as did these, in that each of the others had one thin and ineffective side which transmitted sound to the sides adjacent to it. The thin side of the Keystone room was noticeably resonant, and plainly rendered it impossible to make a fully satisfactory test of the air-space partition. The solid metal-lath plaster partition of the room submitted by J. Russell & Co. acted in the same way in that room.

I do not believe, however, that this defect in the structures has caused any changes in the position on the efficiency list of the Cabot and Sackett rooms.

The efficiency of the Cabot quilt as a material for rendering the partition sound-proof is so clearly demonstrated in these tests that I recommend it for use in the partitions in which these tests were made. The nature of the material in which the quilt is encased should be carefully considered. I do not think it within the province of this report to discuss the partition from other than acoustic considerations, and as an encasing medium the most effective material is Sackett board and adamant plaster.

I would therefore give as my opinion that the best acoustic results would be attained by using a partition of Sackett

board and plaster, with two thicknesses of Cabot's quilt between the plaster board.

I should recommend a wooden stud rather than steel channels if the fire-risk is not materially increased thereby.

As later tests showed, some sort of a suspended ceiling will be needed, as the concrete slab transmits the sound across the top of the partition readily. No trouble will be given by the sound passing through the concrete to the rooms above or below, but unless a layer of Cabot's quilt, with the under-lath and plaster, or of Sackett board and plaster, be put on the under side of the concrete ceiling the efficiency of the partitions will be diminished somewhat.

The front walls could not be tested because of the leaks around the door and through the door-frames, even where covered with a large shutter padded with Cabot's quilt. It is evident that a double glass door will be needed. The floor construction is acoustically good.

## ARCHITECTURAL ASSOCIATION OF IRELAND.

THE second general meeting of the session took place at the Grosvenor Hotel, Westland Row, Dublin, on the 21st inst. The president, Mr. F. G. Hicks, occupied the chair, and there were present a large number of members. Mr. Arnold Mitchell, of London, delivered a lecture on "Some Interests of Mediæval Architecture," which was most highly appreciated. Mr. Charles Ashworth proposed a hearty vote of thanks to the lecturer. He spoke in the highest terms of the lecture and of Mr. Mitchell's kindness in coming so far to give it. Count Plunkett seconded the motion, and made some remarks about the surface colour decoration of Gothic interiors. Mr. J. H. Pentland supported the resolution, which was put to the meeting by the President and passed with acclamation. The next meeting will be held on November 4, when Mr. C. J. McCarthy, the city architect, will read a paper on "Three Weeks in Normandy."

## LORD CHEYLESMORE'S BEQUESTS.

THE late Lord Cheylesmore's bequests for public uses are as follows:—"I give to the trustees of the National Gallery the following pictures, on condition that they shall be kept in the National Gallery, with a label affixed to each one stating that it was bequeathed by me, namely:—(1) 'The Execution of Lady Jane Grey,' by Paul Delaroche; (2) 'The Highland Flood,' by Sir Edwin Landseer; (3) 'Dying Grouse,' by Sir Edwin Landseer; (4) 'Italian Landscape,' by J. van Both; (5) 'Cromer Sands,' by William Collins; and I give to the trustees of the National Portrait Gallery my collection of mezzotint prints, on condition that they shall not part with the different states of the same print, but shall keep them in such a manner that they may be accessible to the lovers of the art of mezzotinting as being the portraits of persons in every state of life in this country; also the catalogue enumerating them and any of my books or engravings which they may care to have; also my collection of portrait prints of the English Royal Family." By a codicil to his will, Lord Cheylesmore transferred this bequest to the trustees of the British Museum.

## THE DUFFERIN MEMORIAL.

A SPECIAL meeting of the Dufferin memorial committee was held in Belfast on Tuesday. Sir Daniel Dixon presided. Mr. F. W. Pomeroy, the sculptor to whom has been entrusted the commission of executing the memorial statue, submitted two models of alternative design. The committee unanimously approved of one. The memorial, when completed, will be of imposing appearance, and will stand 30 feet high. The statue of Lord Dufferin, wearing the robes of the Order of St. Patrick, will be in bronze. There will also be figures representing Fame, Canada and India. The architectural setting of the figures will be in Portland stone, and is on Renaissance lines. It consists of a canopy supported by four Ionic columns, with modelled capitals, the whole standing on a massive base showing four panelled faces, on two of which are seated figures emblematic of Canada and India, and the remaining two bearing the inscription of Lord Dufferin's name and title. The whole is surrounded with carved friezes divided into panels, on which are inscribed names of the countries in which the late Marquis served. Above the canopy stands a dome, on which rises a figure of Fame, bearing a palm and raising the torch of light and learning. The entire work, which will cost 5,000*l.*, will be finished in two years, and the Corporation has granted the Donegall Square at the west side of the new city hall for the erection of the statue. Mr. Pomeroy has been fortunate in securing the collaboration of Mr. Bramwell Thomas, architect of the new city hall.

## NOTES AND COMMENTS.

It is expected that in December there will be an exhibition of the models of the adopted designs for the Queen Victoria Memorial by Mr. BROCK, R.A., and Mr. ASTON WEBB, A.R.A. As the area to be treated will be the space in front of Buckingham Palace, the project will have a less grandiose character than was originally suggested. With the sum likely to be at the disposal of the executive committee it would be impossible to carry out a large group of sculpture, an architectural screen, the alteration of roads and the transformation of the Mall throughout its entire length. The designs in their new form and on an adequate scale will be more easily understood by the multitude, and may have an influence in increasing the list of subscriptions. We have already described the various designs, and it will be remembered that the sculptured group represents a seated figure of the late QUEEN, as well as symbolic figures of the virtues by which HER MAJESTY was distinguished, the whole being surmounted by a figure of Victory.

THE Académie des Beaux-Arts has appointed a jury to examine and determine the relative value of the works submitted in the competition for signs. The members are M. VAUDREMER, architect; M. FRÉMIET, sculptor; M. CHAPLAIN, medallist; with M. BONNAT and M. LUC OLIVIER-MERSON as representatives of painting. The works are to be sent to the Hôtel de Ville, Paris, between November 1 and 15. The Municipal Council of Paris has agreed to bestow one premium of 2,000 francs, two of 1,000 francs, five of 500 francs and six of 250 francs. The competition originated with M. EDOUARD DÉTAILLE, and has excited much interest among the artist-decorators and painters of Paris. So many able artists may appear to be out of place as judges of signboards. But the French do not hold that opinion, and their foremost men are willing to put their dignity aside whenever art in its humblest forms may have to be considered. Toys are less important than painted or sculptured signs. In the approaching competition among the inventors of toys MM. GÉROME, FRÉMIET, DÉTAILLE, COUTAN and REGAMEY will form part of the tribunal. M. ROUJON, the official director of Fine Arts, M. SARDOU, the dramatist, M. HONORÉ, of the Louvre, M. CAILLETET, of the Académie des Sciences, and M. BOUSQUET, a Councillor of State, will also be among the judges, and they will be aided by specialists.

THE demolition of the fortifications of Paris will be more widespread than was at first contemplated. Like most other cities, Paris apparently has a tendency to move westward, and the ground occupied by fortifications adjoining the Bois de Boulogne was therefore coveted. It was, however, difficult to arrange matters with the municipal council. The War Department is not satisfied with abandoning the fortifications on the western side of the city; it has now decided to set back the long line on the northern and north-eastern boundaries, and to construct a new wall by which the Seine will be connected with the fortresses of Pantin, Aubervilliers and with the canal basins that are found near the abattoirs and cattle markets. The subject has given rise to several conferences between the Commission of Credits, the Ministry of War, and the Ministry of Finances. Eventually it has been decided that about 2,000,000*l.* will be expended on new military works. It is expected that double that sum will be derived from the building sites which will be created, in addition to the tax on the increased value which will be levied on owners of adjoining property.

MERCIER'S "Tableau de Paris" is one of those works which are praised by a few and blamed by the majority. He commenced it in 1781, and there is no doubt it helped to bring about the downfall of monarchy and aristocracy in the first Revolution. It was the forerunner of a great many modern descriptions of life, of which MAYHEW'S "London Labour and London Poor" is, perhaps, the most important

to English reformers. There is no doubt MERCIER exaggerated his chiaroscuro, but he was inspired by the spirit of the time, and he could not close his eyes to the abuses which then existed. Undeniably there are errors, but who could write on so large a subject and continue exempt from human fallibility? He has been ignored while less worthy men have been perpetuated by memorial statues. There is not even a street in Paris to commemorate him. It was therefore a wise act on the part of the Commission of Old Paris to advocate a few days ago the erection of a bust of the writer, who was familiar not only with the outsides of the houses of Paris, but with their interiors. It is proposed to place it in the Place de l'Ecole, which is near the house in which MERCIER lived. He was a member of the Convention, but he never succumbed to the spirit of revenge which was then rampant, although not one of the deputies could have been more acquainted with the extent of the wrongs perpetrated by the possessors of power in his day.

It may not be known to all inhabitants of the Metropolis that among the committees of the London County Council is one having charge of historical records. The most useful practice introduced by the Society of Arts of placing memorials on houses which were occupied by distinguished people has been transferred to the Council. The work has been only partially executed, for a great many buildings remain to be indicated by means of tablets. We cannot complain if the work is slow, for in Paris, where the spirit for commemorating is strong, work like that of the Society of Arts is left to a body of subscribers. The committee of the County Council has also resolved to take photographs of buildings before demolition, as well as measurements. One example is Christ's Hospital. The most important acquisition of the Council is No. 17 Fleet Street, which was probably erected in 1710. It is well to have at least one section of the Council's business which is unlikely to give rise to controversy.

THE examinations department of the City and Guilds of London Institute is henceforth to be styled the Department of Technology. The annual report just published and dated October 1902 announces an increase in the number of registered classes from 2,222 to 2,320, of students from 34,246 to 36,189, and of candidates for examination from 15,557 to 16,580. Arrangements are in progress for co-ordinating the technological work of the Institute with that of the Board of Education and the Scotch Education Department. The growth of the examinations is evident when it is found that in 1879 there were only 202 candidates' papers, while this year the number was 15,615. There were marked increases in the attendance in many of the subjects connected with the building trades, but it must be said that the failures are on an average rather high. In plumbers' work it was 56.4, and in the preliminary grade 67.3. In carpentry and joining it was 50.2 and in the preliminary 57.4. In brickwork the percentage of failures was 29.8, masonry 32.8, plasterers' work 16.3, painters and decorators' work 41.5. In builders' quantities the failures were 42.3. Taking the forty-nine subjects as a whole, the failures were 41.4. Last year they were 44.4. The Institute's examinations have been extended to India and some of the colonies. Undoubtedly good work is being accomplished, and without any expense to the country.

## MUNICIPAL BUILDINGS, DEPTFORD.

THE THREE PREMIATED DESIGNS: By (1) Messrs. LANCHESTER, STEWART & RICKARDS, (2) Messrs. S. B. RUSSELL & C. E. MALLONS, (3) Mr. A. J. GALE.

DESIGN by Mr. A. BRUMWELL THOMAS.

## THE SOCIETY OF ARCHITECTS.

THE nineteenth annual general meeting of the Society of Architects was held on the 23rd inst. at St. James's Hall, Piccadilly. Mr. G. Gard Pye, vice-president, occupied the chair. After the transaction of some formal business, Mr. F. W. Chancellor (Chelmsford) moved the adoption of the following report:—

A number of applications for membership has been received, resulting in twenty-nine elections to membership; twenty members have resigned, four have died, and three have been removed, the total membership being 597.

The number of students has more than doubled in the last two years, there being now thirty-eight names on the roll, fifteen having been added during the session. Two students have resigned. Considerable interest continues to be taken in the design and measured drawing competitions instituted from time to time, two such having been held during the session, the subjects being "A Design for a Shooting Box" and "Measured Drawings of a Church Porch or Font." The following were the successful competitors:—"Shooting Box," 1st, J. Algernon Hallam, London; 2nd, J. Nixon Scaife, Carlisle. "Church Porch," 1st, E. L. Hampshire, London.

At the ordinary general meetings the following papers were read and discussed:—Presidential Address, S. Trevel, J.P., F.R.I.B.A.; "Hammered Ironwork," W. Höfler; "Early British and Celtic Art," M. Sullivan; "Stained Glass," Herbert Bacon; "Ancient Lights," Walter C. Williams; "Ancient Hampshire Palaces," S. W. Kershaw, M.A.; "People's Baths," W. W. Thomas.

It having been represented to the Council that amongst the Board of Examiners in Science there appeared to be no architect to deal with "Building Construction," though the papers on this subject appeared to relate rather to architectural than engineering construction, the Council took the matter up and received an intimation that the question would be considered.

The Council having had before it the question of county surveyors and private practice, the matter was discussed and the following resolution unanimously passed:—"That this Society is of opinion that it would be in the best interests of the public if architects, surveyors and engineers holding official appointments were debarred from private practice."

The Council has noted with satisfaction the formation of a joint committee of the R.I.B.A. and the Surveyors' Institution to take into consideration the present state of the law with regard to ancient lights, and has intimated to the joint committee its willingness to afford them any information or assistance in its power. At the ordinary general meeting in March the following resolution was unanimously passed:—"That it be referred to the Council of this Society to take such action as may be necessary to promote some legislation to amend the existing law appertaining to rights of light." The matter is engaging the attention of the Council.

A special meeting of the Council was called in June to consider the resolution passed at a meeting of the Royal Institute of the Architects of Ireland relative to the proposed election of an architect by the Treasury, in connection with the erection of a college of science in Dublin. It was unanimously resolved, "That the sympathy of this Council be tendered to the Royal Institute of the Architects of Ireland in the attitude they have taken on the subject of the proposed election of an architect by His Majesty's Treasury for the erection of a college of science in Dublin, and it is the opinion of the Council that for an Irish work of this national character an Irish architect should be solely employed." A copy of the resolution was sent to the First Lord of the Treasury and to the Royal Institute of the Architects of Ireland.

At the Council meeting in November it was unanimously resolved that the gold medal of the Society be presented to Mr. Walter Emden (past president) in recognition of his services to the Society during the past four years; this was confirmed at the ordinary general meeting on the same day, and the presentation took place at the December meeting.

It has not been deemed advisable to take immediate steps to form branches of the Society in the provinces, as has been suggested, but the Council has under consideration the formation of students' sections in various centres, with the object of affiliating the younger members of the profession with the Society, and as a means of organising the entrance examinations in the provinces.

The Society has become an annual subscriber to the Architects' Benevolent Fund, and the Council desires to commend the fund to the notice of members as worthy of support.

The half-yearly examinations continue to attract many inquiries and an increasing number of candidates. This is largely due to the policy of the Council in extending the examinations into the provinces. A centre has been formed and examinations held in Manchester, as well as in London. The Council has appointed as examiners in section I, subject A, Messrs. R. F. Vallance, F.R.I.B.A., and S. Wyborn, in the places of Messrs. W. A. Bassett-Smith and J. W. Manning, resigned. The syllabus has been revised and materially strengthened.

In consequence of the death of Mr. J. Campbell, F.R.I.B.A., the local hon. secretary for Bombay, it became necessary to appoint a successor, and Mr. C. S. Stevens, of that city, has kindly consented to act. The Council takes this opportunity of thanking the local hon. secretaries for the assistance they have rendered whenever called upon, particularly in connection with the examinations.

On April 25, a large number of members availed themselves of the kind permission of His Eminence Cardinal Vaughan to inspect the Roman Catholic cathedral in course of erection at Westminster from designs by the late Mr. J. F. Bentley; the Very Rev. Dean L. G. Vere, one of the canons, conducted the party over the works. In the evening the members' annual dinner was held at the Prince's Restaurant, Piccadilly, the president, Mr. Silvanus Trevail, J.P., F.R.I.B.A., presiding over a large and representative gathering of members and their friends, and being supported by a number of distinguished guests.

On May 24 a well-attended field day was held at Winchester, and was very successful, the ecclesiastical, military and civil authorities having afforded special facilities for viewing the various buildings, &c., under their charge. The Right Worshipful the Mayor of Winchester and others joined the party at luncheon, the Mayor afterwards entertaining the members to tea at the Abbey House.

The Council continues to be fully alive to the necessity of increased activity in forwarding the statutory education and registration of architects. The President has addressed a meeting of West Country architects at Plymouth, where a unanimous vote was given in favour of the principle of registration, and from representations made to the Council it has been felt that the time has come when it should still more actively identify the Society with the movement, therefore the Council has appointed a committee to confer with the Architects' Registration Bill committee (a body of architects distinct from the Society) with a view to additional co-operation, or, if thought desirable, taking over its work.

At the invitation of the Royal Institute of Public Health and of the Sanitary Institute, the Council appointed the following to represent the Society at the Exeter and Manchester congresses:—Messrs. Silvanus Trevail, J.P., F.R.I.B.A., president; G. Gard Pye, a vice-president; Ellis Marsland, hon. sec.; C. Cole, local hon. sec., Exeter; and C. Caine, Manchester.

At the invitation of the newly-formed photographic survey of Surrey, the Council appointed Messrs. S. W. Kershaw, M.A., hon. member, and H. G. Quartermain, hon. treasurer, delegates from the Society on the committee.

The balance-sheet to be presented at the November meeting will show the reserve fund to have been largely augmented and the finances administered with due regard to the interests of the members and the efficient working of the Society. Considerably over 500*l.* has been placed to reserve during the session, the fund now amounting to 700*l.*, of which 500*l.* has been invested in 2½ per cent. Metropolitan Consolidated stock, the balance remaining on deposit at the bank.

A number of posts have been filled through the medium of the register, but it is not made use of to the extent it might be, and members and students are reminded that they have the free use of it and that it is conducted for their benefit.

It is satisfactory to be able to report continued progress in every department of the Society's work; the membership is higher than it ever has been at the corresponding period in any year, the examinations have become better known and appreciated, the various meetings have been well attended, and the members, especially the local hon. secretaries, have willingly assisted the Council in its work. It is the wish and aim of the Council to make the Society of more practical use to the members, particularly to those who, practising at a distance, are unable to keep in personal touch with headquarters. It is impossible to find out all the needs of members, but if the latter will assist the Council by making their wants known the resources of the Society can be developed in ways best calculated to advance their individual interests and promote the objects of the Society generally. Members should claim their privileges and use the Society's premises when in town; communicate with the secretary on any matter affecting their interests as members or their position as architects, or retain the services of the practice committee for advice on points of practice. The Council is always glad to receive, and if possible act upon, suggestions for extending the scope of the Society and the privileges of membership, but the future of the Society rests not so much with the Council as with the general body of members, for only with their co-operation can full advantage be taken of its continued and increasing prosperity and influence.

Mr. Chancellor expressed agreement with the resolution in favour of debarring county surveyors from private practice, but asked if "county surveyors" was intended to include surveyors under the Ecclesiastical Dilapidations Act.

The Chairman replied in the negative.

Mr. B. R. Tucker (London) seconded the motion, which was adopted.

The following officers and members of the Council for the year 1902-3 were elected:—*President*—Silvanus Trevail, F.R.I.B.A., J.P., Truro. *Vice-Presidents*—Walter W. Thomas, Liverpool; G. Gard Pye, London. *Honorary Secretary*—Ellis Marsland, London. *Honorary Corresponding Secretary*—W. R. Mallett, London. *Honorary Treasurer*—H. G. Quartermain, Merton. *Council*—R. G. Bare, London; W. R. Bryden, F.R.I.B.A., Buxton; Chas. Caine, Manchester; F. W. Chancellor, M.A., Chelmsford; W. Cooper, Hastings; J. W. Dyson, Newcastle-on-Tyne; W. L. Grant, Sittingbourne; W. J. Jennings, F.S.I., Canterbury; H. E. Knight, London; F. W. Macey, London; A. E. Pridmore, F.S.I., London; B. R. Tucker, London.

The following nominations were announced:—For membership—F. W. Chancellor, Winchester; P. H. P. Haigh, London; N. Austin Leech, London; C. H. Mead, London; T. Overbury, Cheltenham; H. Teather, Cardiff; C. L. Wilson, Cardiff; J. Wills, Derby. For studentship—H. J. T. Gowen, Norwich; H. Milne, Tewkesbury; J. E. Todd, Southsea.

The following gentlemen were then elected by ballot:—As a member—F. Broadbent, Leeds. As students—Noel F. Barwell, London; W. J. Pulford, Maldon.

The Chairman then presented the prize awarded to Mr. E. L. Hampshire for measured drawings in the Students' Competition.

### THE SURVEYORS' INSTITUTION.

THE land agents' committee of the Surveyors' Institution (Irish branch) met on the 21st inst. at their offices, 110 Grafton Street, Dublin. Major H. G. S. Alexander, F.S.I., presided, and there were also present Messrs. Toler R. Garvey, George F. Stewart, D.L., Hugh Galbraith, Maurice Knight, James Penrose, Alfred H. Wynne, Thomas Courtney Townshend, Chas. Dickinson, G. R. M. Hewson, Robert Sanders, G. de L. Willis, and A. B. Watson, LL.B., secretary.

The minutes of the last meeting having been read and confirmed, questions of interest to land agents in connection with the present public discussion of the land question, and also bearing on the expected Land Bill, engaged the committee during the greater part of the sitting. Subsequently communications from the Surveyors' Institution, London, were read, approving the Irish examination courses for the admission of land valuers and building surveyors (in which latter class are included architects and civil engineers) to the membership and F.S.I. diploma of the Institution. These examinations, adapted as to some minor points to requirements in Ireland, are practically identical with the English courses, and will be held simultaneously with the London examinations in March next.

### PREHISTORIC BRITISH POTTERY.

A PAPER on the "Oldest Bronze-age Ceramic Type in Britain, its Close Analogies on the Rhine, its Probable Origin in Central Europe," was prepared by the Hon. John Abercromby for the British Association. The oldest type of pottery in Britain is the "drinking-cup," for which it is proposed to substitute the shorter term "beaker." Thurman recognised three types, designated  $\alpha$ ,  $\beta$ ,  $\gamma$ . Type  $\alpha$  seems to be the oldest and  $\gamma$  to be derived from it;  $\beta$  has a different secondary origin from  $\alpha$ . Twenty-five interments are described in which the beaker was accompanied by ancient objects; three with large flint daggers, three with buttons with the V-shaped perforation below, and five with stone wrist-guards, all of which objects belong to the later neolithic period on the Continent. None of the objects found with the remaining fourteen interments are of later date than the thin, flat, broad knife-dagger. As no other ceramic type in Britain can show such a pedigree, it is clear that the beaker is the oldest, though before it died out several other types of fictilia came into use. The beakers found with food-vessels and burnt interments are shown by their form and ornament to belong to a rather late period. As ornamentation is a very important subject, fifty-nine examples taken from the three types were exhibited and contrasted. Some later developments are pointed out. The ornament, like the form, points to a different secondary origin for  $\alpha$  and  $\beta$ . The localities where beakers have been found in Great Britain and Ireland are shown on a map. Though  $\beta$  is the least represented numerically, it has the widest diffusion. It extends from the coast of Sussex to Sutherland—perhaps to the Shetlands—and is the only type at present known in Ireland. Ten photographic examples of type  $\beta$  from the Rhine, between Coblenz and Mainz, were compared with ten British. The ornament of the Rhenish examples is shown on a slide and compared. Some of the ornament on the Rhenish beakers is borrowed from a different type known as the "bell-shaped

beaker." This particular system of ornamentation is not found west of the Rhine Valley, south of the Danube, east of about the longitude of Vienna, or north of the latitude of Berlin.

The origin of type  $\alpha$  can only be suggested, not demonstrated. Its form seems derived from the much earlier Schnur-becher and its later offshoots. But the practice of distributing the ornament in zones or bands is probably owing to the influence of the "bell-beaker." Type  $\beta$  is derived from a type much more influenced by the "bell-beaker," though some examples of it are perhaps merely late modifications of the "bell-beaker." In type  $\alpha$  the influence of the "bell-beaker" is much less direct, so that, supposing both  $\alpha$  and  $\beta$  are offshoots of the "cord-beaker," they have different secondary origins, but go back to a common form at a point in time many centuries earlier. But the possibility is not excluded that the origin of  $\beta$  is to be referred entirely to the "bell-beaker," in which case  $\alpha$  and  $\beta$  have an independent origin.

The areas in Central Europe where the "cord-beaker" and its offshoots as well as the "bell-beaker" are found are Northern Bohemia and the region of the Saale, a western tributary of the Elbe. As a fully developed type  $\beta$  occurs on the Rhine, both at the centre of its course and near its mouth. From the Rhine it passed over to Britain.

### LONDON SCHOOL BOARD AND REHOUSING

AT last week's meeting of the School Board for London Mr. Lyulph Stanley brought up the report of the works committee with reference to the scheme for transferring the Board's liabilities for rehousing to the London County Council. The committee reported that they had considered a letter from the Home Secretary expressing the hope that, in view of the class of persons for whom the housing accommodation was intended some reduction of the proposed rentals might be found possible and stating that it would be necessary that the Board should give a bond of 10,000*l.* for the execution of the scheme.

A long discussion followed, with reference to the reply which the committee proposed to send to the Home Office. Ultimately, the letter was agreed to in the following form:—

"Sir,—The School Board have had under consideration the letter from the Home Office, dated August 28 last, with reference to the scheme for the transfer of the Board's liabilities for rehousing to the London County Council. In reply, I am instructed to state that the School Board are proposing to pay a sum of 10,359*l.* to the London County Council in consideration of the latter body taking over the liabilities of the School Board for the housing of 1,030 persons. Thus the School Board are already subsidising the cost of housing these persons so as to secure that they shall be accommodated at as low a rate as possible under the circumstances. The County Council themselves in their housing scheme estimate the return at 3 per cent. upon their outlay. As it is obvious that no private capitalist could undertake to build houses for the working classes, or any other persons, on a return of 3½ per cent., it will be seen that, in addition to this subsidy of 10*l.* per head, the rehousing scheme which has been approved by the Home Office will secure accommodation very much below the ordinary cost. If the meaning of the Home Office is to recommend that a cheaper system of construction be used so as to enable the London County Council to reduce the rents, while still obtaining a fair return for the capital outlay, they will forward the suggestion to the London County Council and request them to do all they can to meet the view of the Home Secretary. But if the suggestion of the Home Office is to lower the rent without lowering the cost of building, this seems to raise an important economic principle; and, although the correspondence on this subject has now been going on between the Home Office and the School Board for upwards of two years, this is the first time that the suggestion has been made. The School Board feel that the amount of the rents is, under the proposed arrangement, a matter for the County Council to fix; and, further, they doubt their power to draw upon the School Fund for any larger sum than the 10,359*l.* agreed upon with the County Council. With regard to the statement that the Board should give a bond of 10,000*l.* for the execution of the scheme, I am instructed to state that the Board were under the impression, from the previous correspondence of the Home Office, that the Home Secretary would be willing to accept the transfer of the Board's obligations to the London County Council, and that the position of the latter body would have been a sufficient guarantee to the Home Office for the carrying out of all these obligations without any bond being given by the School Board. If, however, the Home Secretary still insists that the School Board should give a bond of 10,000*l.* for the execution of the scheme, they are prepared to do so, and will forward a draft as requested.—I am, &c."

## EXAMINATION OF BUILDING CLASSES.

THE following are the reports on the results of the examinations of 1902 by the Department of Technology of the City and Guilds of London Institute:—

## CARPENTRY AND JOINERY.

(Professor T. R. Smith and Mr. S. Barter, *Examiners*.)

*Preliminary Examination.*—It is with regret that we have to again observe that the general standard of the candidates' work leaves much to be desired. The paper was easy, and the candidates were only permitted to answer ten of a total of fifteen questions. In previous years they were allowed to attempt as many of the questions as they could. The innovation was made with a view to preventing hurry and to give a wider field of choice. The arithmetic was better than in most papers of recent years, but was still not good. The plane geometry was by no means good. The simple question in solid geometry was the most commonly neglected of all, and where attempted was generally very badly answered.

The drawing was on the whole distinctly poor. It was inaccurate and showed ignorance of principles. The construction of a plane scale was commonly understood to mean a mere copy of a scale. The drawing of a cupboard front was frequently not attempted, and where it was made was badly drawn. Many who appeared to know what was wanted failed to make the drawing correctly, simply because they could not draw. There has been a steady deterioration for some years past in this drawing, and it would appear that elementary mechanical drawing is not satisfactorily taught in, by any means, all our schools. Too much teaching is attempted with insufficient exercise with the drawing tools. The grading of the candidates was rather remarkable. Good papers were in sharp contrast to bad ones, and the number of average candidates was comparatively small. This indicates apparently poor preparation in the classes, and the evidence of the papers of many of the failures confirms this view. In many cases it is surprising that candidates should have presented themselves at all. The work of the better candidates shows that at least some very good teaching is given, and the chief fault of the remainder is that they show signs of "cramming" rather than of steady preparation.

*Ordinary Grade.*—There was a sharp contrast between the good and the bad candidates similar to that noticed in the preliminary, but not quite so marked. Draughtsmanship was bad. Candidates appeared to know what was wanted, but to be unable to give expression to their knowledge in drawings.

*Question 3.*—The proportions of the mortice to the style of door were very defective. The joint is of the utmost importance to a joiner, and as nearly all candidates attempted this question affords a very sound test as to the thoroughness of the training of the candidates. So badly were the proportions chosen that in a large number of cases no thought at all seems to have been exercised in deciding this important matter. The position of the lock in the answers given frequently involved cutting away the strongest part of the joint made, and consequently weakening the joint in an altogether inadmissible degree.

*Question 7.* (Six leading joiners' joints).—Frequently all carpenters' joints were chosen, and where good joiners' joints are taken the proportions of the parts were very faulty. It could be well if teachers would carefully distinguish carpenters' from joiners' joints and make their pupils realise their general principles and objects. This is of the greatest importance in workshop and would render later teaching easier while at the same time affording opportunities for good drawing lessons. The sash and frame (sash hung on centres) in Question 6 were frequently correctly made and the whole answer spoiled by the manner in which the beads were cut. Windows made, as too frequently drawn, could not be opened. The simple geometrical problem in this question was clearly not understood.

*Questions 13 and 15.*—The trusses and bracing in the answers to these questions were used in impossible places and actual work would be decidedly detrimental, rather than relieving the object of their introduction. Some 20 per cent. of the papers were however really good, and a number of excellent ones were amongst these. Generally the work was better than that of last year, but the old fault—helplessness when deprived of the aid of text-books—was apparent. The questions were naturally not devised to enable the candidates to perform a feat of mere memory, but to test their intelligent utilisation of the principles of the study they had made, or should have made, of the subject.

*Honours Grade (Practical).*

The specimens of work submitted were, as a whole, very good, and amongst them were some very fine ones. The old fault of making small models of large pieces of work was still apparent. These specimens, while they make good teaching models, are not good tests of hand skill. Preferably candidates should make some detail of work, such as they have to make in a workshop. Many sent workshop rods with their work,

and for the honours stage this custom is better than that of rendering a drawing. The practice is strongly commended. The practical test contained a difficulty which was left entirely to the candidate's judgment to solve, and on the whole they did well. For a time test the work was of a high character. The draughtsmanship was very good, and a steady improvement has been noticeable during the past few years in this respect.

*Honours Grade (Written).*

The results of the written examination in the honours grade were in many respects satisfactory, the answers to questions on joinery being rather better than those to questions on carpentry. The drawings were, generally speaking, well executed, and showed familiarity with the preparation of working drawings. The tendency to draw and describe what can be got out of text-books in preference to that which would be learned from actual work by an observant craftsman is, unfortunately, too prevalent in the greater number of these papers. For example, the use of timber beams to carry floors over wide spaces has been completely abandoned since the introduction of girders of steel or iron, but in answer to a question on the construction of floors, candidates have constantly shown such beams, and not more than two or three have added that they are now obsolete, while a very small number indeed have shown the method which they must see being pursued in every building of any importance on which they work. Other answers to questions dealing with centering, with timber partitions, and with a timber roof of large span, such as might be used over a drill shed, include mistakes of the same nature, though it must in fairness be added that these answers also include good honest intelligent work. Answers to a question inviting the candidate to describe some failure of a piece of carpentry or joinery which had come under his personal observation, and to point out how the defect might have been avoided, brought out, together with some trivial cases, descriptions of serious failures, and show keen observation and a very intelligent grasp of the situation. Another question referring to dry rot and its cure showed generally a correct knowledge of the proper remedies; but many of the average candidates failed to grasp the very formidable nature of this disease and the great thoroughness with which it must be combated.

Turning to the joinery questions, most of the candidates showed a familiarity with the geometry involved in questions of setting out work (including one piece of somewhat difficult handrailing) and with the modes of framing joinery and securing it in place. Curiously enough, the greatest variation occurred in answering the simplest problem set, viz. the construction of a set of bookshelves to fit a recess. Some of the answers to this were remarkably imperfect. The best answers were elicited by a question requiring an important door with its appendages to be drawn, and the process of constructing it in a modern workshop to be described. In answering this question, especially the latter part of it, the candidate had to rely mainly upon his own observations, and the result has been on the whole very satisfactory. In conclusion, it is fair to add that the above remarks, so far as they are of a disparaging nature, apply chiefly to the work of candidates who failed to pass, and of those who obtained low marks, rather than to that of the men who are well placed. Many of the successful candidates are to be congratulated upon having done work which is not only free from any serious defects, but is excellent in its nature, and very intelligently set forth, both by writing and by drawings.

## BRICKWORK.

(Mr. H. W. Richards and Mr. R. Roberts, *Examiners*.)

In the ordinary grade there was a decided improvement upon the papers of previous years. There were very few candidates who had not attempted at least some of the questions. The honours grade still gives cause for complaint, and it would scarcely seem that the candidates had received the necessary careful instruction.

We again ask that the candidates should be more particularly requested to state where they gained their experience, as this is of great assistance in fairly judging the papers. This is equally necessary in brickwork and in masonry.

## MASONRY.

(Mr. H. W. Richards and Mr. H. D. Searles-Wood, *Examiners*.)

The answers in the ordinary grade were very satisfactory. The candidates displayed intelligence and did good drawings. The honours papers were again of a low standard, and it is difficult to imagine that the candidates had previously passed the ordinary grade.

## BRICKWORK AND MASONRY.

We are sorry to find that so few candidates presented themselves for examination, and recommend that more encouragement should be given to practical men to induce them to endeavour to gain these certificates. With few exceptions the candidates examined did not appear to have been thoroughly prepared.

We would urge the necessity of more general training in setting out. Before a student, either in brickwork or masonry, attempts to cut a piece of work he should without the aid of the teacher be able to prepare his own templates, moulds, &c. We found that two Institutes went to the trouble of forwarding to the examination centre complete sets of tools for the use of their own candidates. We wish that other Institutes would follow this good example, thus enabling their students to take the examination under more favourable circumstances.

#### PLASTERERS' WORK.

(Mr. W. Millar, *Examiner*.)

The number of candidates in the ordinary grade is slightly in excess of the number entered last year, and there is a decided improvement in the general knowledge of the trade, as shown by the answers.

With regard to the honours grade, I was pleased to find a marked improvement in the answers compared with last session. There were three creditable examples of practical work, but the others were not up to the average.

There seems to be a tendency on the part of the students, or perhaps the instructors, to confine their work to modelling instead of the more practical and everyday class of work, such as making models of cornices, arches, pediments, columns, panelled ceilings, raking mouldings, piece moulds, &c.

#### PAINTERS' AND DECORATORS' WORK.

(Mr. A. S. Jennings and Mr. H. G. Liley, *Examiners*.)

The papers are up to the average, although there is distinct evidence in many cases that the students have had little or no practice in writing answers. Teachers are again urged to give exercises in writing answers to questions on practical subjects, so that a candidate who possesses a knowledge of how a particular piece of work should be executed may be able without difficulty to write an answer that will render it clear to the examiners that he actually possesses such knowledge.

The written answers to questions this year show a marked improvement, some excellent papers being sent up. The practical work, however, is in many cases far from satisfactory. As more time was given to the preparation of the practical work this year it was expected that considerable improvement would be noticed, but this is far from being the case. The brush work is in many cases poor. The preparation of stencils does not appear to be properly understood, many of the students having failed to put in sufficient ties to hold the parts of the stencil together. The relief material which was decorated was in many cases most imperfectly done, the worst features of a design being frequently emphasised and the effect produced being decidedly bad. In a few cases the design of the relief material had been carefully considered before decorating it, but this was rather the exception than the rule. Perhaps the most conspicuous fault in the work submitted when considered as a whole was the very poor selection of colours when such selection was left to the students. A room finished in the colours shown in some of the panels submitted would be far from pleasing in appearance. Most of the students evidently need considerable instruction and practice in the selection of colour combinations for plain work. Some excellent examples of glass gilding were submitted; the lettering was fair and the graining generally good.

#### BUILDERS' QUANTITIES.

(Mr. F. Henniker, *Examiner*.)

A great increase is noticeable in the number of candidates this year. The percentage of passes is very satisfactory, being about the same as last year. Of the candidates who passed in the ordinary grade, the majority have passed well and have showed that they have been well taught, the answers being much better than last year. There were two questions which were very badly answered by many of the candidates, viz. No. 3 and No. 10. In the honours grade there were many very good papers, and the answers were on the whole better than last year. Question No. 4 was in a great many cases very badly answered.

#### PLUMBERS' WORK.

(Dr. H. R. Kenwood, Mr. George Taylor, Mr. W. H. Maxwell, *Examiners*.)

The improvement noted last session has barely been maintained, and elementary science questions are still either avoided or answered indifferently in a large proportion of the papers. The very general lack of knowledge of the underlying principles of chemistry and physics, in so far as they bear upon plumbers' work, is a matter to which the examiners would again direct the attention of instructors. The candidates should be informed that the majority of those who fail to satisfy the examiners fail on this account in both the preliminary and ordinary grade examinations. Candidates should also be taught to strictly confine their answers to the questions set.

Questions requiring freehand sketches of tools and apparatus have been exceedingly well answered, but there has been a great lack of ability shown in the attempts to represent con-

structional details by means of good clear effective sketches and in drawing details to scale.

A fairly intelligent knowledge has been shown by most of the candidates in the answers to questions on practical details of construction, but, as in the preliminary examination, the questions dealing with the principles of chemistry and physics are for the most part poorly answered; for instance, a large proportion of the candidates were ignorant of what constitutes "hardness" in water.

Although a large number of candidates have gained high marks in honours grade, there are many whose answers to questions on construction and methods of practically carrying out work are so incomplete that it seems incredible that the excellent practical work submitted should have been executed by the same candidates.

The quality of the work done in the practical examination reflects great credit on the instructors. There is greater uniformity in the mode of execution, and less error in setting out the work than in previous sessions.

The lead-burning test, forming part of the examination for the first time, has been most creditably executed, and this circumstance proves that it only requires perseverance and opportunity for practice to make this most useful and necessary part of plumbers' work more general in every branch of the industry than has hitherto been the custom.

It is very gratifying to the examiners to report that notwithstanding the fact that the standard of pass marks for the honours written examination has been raised, there is a large number of candidates who have successfully passed both the written and the practical examinations in the first class of each grade than in the previous session.

The Colonial candidates are fewer in numbers than in previous sessions, but they have fairly maintained the position of efficiency in both sections of the examination.

#### DIRECT REDUCING LEVELLING STAFF.

A DESCRIPTION of a new staff was submitted to the British Association by Mr. G. W. Herdman, B.Sc., Assoc. M.Inst.C.E. The object of this staff is to lessen the arithmetical work which is always necessary to obtain from the observation through the level telescope the actual height above datum (or "reduced level") of the spot where the staff is held. The staff may be any number of feet in length, and may be graduated according to any pattern which the user finds convenient. It differs essentially from the ordinary levelling staff in having a shoe which slides on the staff at the end with the maximum graduations, and which can be extended and fixed at any particular hundredth of a foot so as to lengthen the staff by the amount of that extension. The method of employing it is as follows:—Having set up the level, the height of the instrument or "collimation level" is obtained, as usual, by adding to the value of the "bench mark" on which the staff is held the reading seen on the staff. The shoe is now extended to the amount of the decimals in the collimation level, and in the field book beneath the collimation level is written the "datum level," which is the total length of the extended staff less than the collimation level. The "datum level" consequently is a whole number without decimals. All other observations from this position of the level are now taken with the staff inverted, i.e. the shoe on the ground, and the reduced level is obtained by adding the reading to the datum level. The amount by which the shoe is extended only has to be altered when the collimation level is altered, i.e. when the instrument's position has been altered. The booking as reduced levels of a large number of observations from one position of the level is extremely simple and rapid.

#### APPORTIONMENT OF GROUND-RENTS IN GLASGOW.

FOLLOWING upon the arbitration proceedings between Glasgow Corporation and Mr. Matthew Brechin, 15 Sandford Place, under which the amount of compensation for the value of the ground acquired by the Corporation and loss of amenity to the remaining property was determined, a petition was presented to the sheriff of Lanarkshire by the Corporation, says the *Glasgow Herald*, for the purpose of having it judicially determined what proportion of the ground annual of 1901 affecting the whole ground should be paid by the Corporation for the part thereof acquired by them compulsorily for the widening of Sauchiehall Street. The extent of the whole ground originally belonging to Mr. Brechin was 496½ square yards, and the portion taken by the Corporation was practically an eighth thereof. In the action to which Mr. Brechin and the holders of the ground annual were called as defenders the Corporation pleaded that the portion of ground acquired by them was a carriage-way and pleasure-ground, and was restricted to these purposes for all time coming; that the over-

man in the arbitration proceedings had valued the ground taken at 20%, and that the proportion of the ground annual of 15%, to be payable by them, should be 4s. 4d. per annum, being the proportion that the value of the part taken bore to the value of the whole. Mr. Brechin maintained in his defences that the Corporation should relieve him of the proportion of ground annual applicable to the area taken independently of value, viz. 1*l.* 17s. 6*d.* Mr. Sheriff Fyfe, before whom the case was heard, gave effect to Mr. Brechin's contention and awarded him twenty guineas of costs. The Corporation appealed against the sheriff-substitute's decision, and after hearing counsel on both sides, the sheriff-principal has now issued an interlocutor adhering to Sheriff Fyfe's judgment, with eight guineas additional costs. The following is Sheriff Berry's interlocutor:—

"Glasgow, October 20, 1902.—Having heard counsel for the appellants and the respondent Brechin, adheres to the judgment appealed against. Finds the appellants liable to the respondent Brechin in the sum of 8*l.* 8s. sterling of expenses and decerns therefor.

(Signed)

"ROBERT BERRY."

Note.—This appeal has been objected to as incompetent, but in the view I take of the case I think it unnecessary to deal with the question of competency. A written record has been made up, and no proof having been taken, written admissions have been lodged in place of it, so that the conditions required by section 139 of the Lands Clauses Act to the right of appeal from the judgment of the sheriff-substitute seem to be satisfied. Still as in the result I think the view of the case on the merits taken by the sheriff-substitute is correct, it is sufficient to dispose of it on that ground. The question between the parties, shortly, is whether the ground annual is to be apportioned according to area or according to value. The ground taken by the Corporation is no doubt of less value than the ground which has not been taken, there being a restriction against building on it, while on the remaining ground here is a dwelling-house of considerable value. It is, however, on the ground as a whole that the ground annual is secured; and I am not aware of any other principle of apportionment of the burden having been recognised where part of a piece of ground is taken compulsorily than the proportion which the extent of the part so taken bears to the extent of the whole. The rule in regard to the apportionment of feu-duties as laid down in the cases cited in the course of the argument presents an analogy in favour of that being the true rule to be applied in cases like the present. It is said that the rule may operate inequitably where, as here, different portions of ground are of different value. But difficulties might arise if action were given to the introduction of other considerations than that of area, and I am not prepared to give effect to the argument based on general views of equity which was submitted to me. With regard to expenses, I do not think there is any reason for my interfering with the sheriff-substitute's award. The respondent is entitled to the expenses of the appeal.

(Intd.)

R. B.

## RELATIVE PERMANENCE OF STEEL AND MASONRY CONSTRUCTION.

FORMAL papers, prepared with deliberation for delivery before an audience, or for publication in a periodical, are every excellent and desirable means for imparting information, but it is questionable whether, for the giving of information in an impressive and memorable form, they equal the more accidental method of viva-voce discussion, says the *American Architect*. It is this belief that leads us to quote at length the discussion that our fellow-professionals, the members of the American Society of Civil Engineers, recently held on the ever-interesting topic of the lasting qualities of modern methods of construction.

Charles G. Darrach, M.Am Soc C.E.—The speaker approaches this subject with some trepidation, as it is worthy of higher talent than he possesses.

To deal with the subject properly, there should be not only discussion, but contention and consultation, so that it may not be recorded among the dead by the epitaph which heads our publications:—"This Society is not responsible as a body for the facts and opinions advanced in any of its publications."

The speaker would suggest that the subject be amended so as to read, "Is metallic construction or the combination of metallic and cement concrete susceptible of being made as permanent a building material as masonry?"

Many years ago the late Julius W. Adams, then president of the Society, suggested to the speaker that it was preeminently the business of the engineer to adapt the motif of construction to the genius of the locality in which his field operations lay. This is, in fact, the chief business of the engineer, and is using the best and cheapest means for the end to be attained.

It must not be forgotten, however, in making comparisons,

that the best materials may be manipulated so as to produce inferior results, and the proper use of materials in composite engineering construction is as absolutely necessary as in the domestic arts which please our palates, for it is well known that the cook can either spoil the pie or make the pudding.

Before determining upon a method of construction there should be considered not only the first cost, but also the expense of maintenance. The ease of inspection during erection should also be considered, as well as the adaptability of the material to obtain the most economical results.

A knowledge of the relative strength of the various materials, and also of the causes for deterioration and decay, should be attained. With this knowledge the problems will reduce themselves to some degree of simplicity. This knowledge can then be supplemented by observation and experiment, so that there need be no reason to fear results. Knowing the disease, the remedy therefor can be obtained.

The idea that masonry is the sine qua non of all permanent construction seems to the speaker to be without foundation. Permanence of masonry construction depends not only upon proper design, but also upon perfect workmanship. All who have had any experience in construction know well that the most trying and difficult task of the engineer is to have masonry properly erected. In masonry construction, dependence must be placed upon the physical value of the stone, sand and cement. The stone, being a natural product, may or may not have that degree of permanence expected by the engineer, and to meet this contingency a large factor of safety is generally introduced in the calculations for masonry construction. Also, in many cases where masonry is used, it is impossible to design the structure so that the economical quantities of material to meet necessary requirements can be used.

As has been intimated, masonry, as well as metallic construction, may be subject to deterioration and decay.

In using metallic construction, it is possible to calculate the stress upon the structure with a far greater degree of accuracy than can be applied to a masonry structure; consequently, the factor of ignorance can be reduced and the quantity of material used be nearer to that which is theoretically required. Inspection during construction and erection and after completion is more convenient, and, knowing the causes for deterioration, the necessary remedies and protection may be readily applied.

The use of concrete or artificial stone appeals to the speaker with much force. By its use artificial stone of equal value throughout the entire content can be obtained, and that value can be determined in direct accordance with the material of which it is made, so that the composition of the artificial stone can be adapted directly to the use for which it is intended. The cost of construction for equal values in artificial stone is generally much less than if natural stone were used.

Artificial stone or concrete forms a protection against the usual deterioration of metallic construction by atmospheric influence.

The logical conclusion seems to be that the best method of construction would be composite, using artificial stone and metal. Artificial stone or concrete not only forms a protection for the metal, but adds its value in resisting stress, and, except in subterranean and subaqueous structures, the deterioration of metal encased in cement concrete of proper composition may be disregarded.

There are many examples of structural metallic work encased in concrete where no deterioration is shown, even from ancient times. The modern system of iron construction encased in concrete or brick masonry, used in high office buildings, shows that, when properly constructed, there is no observable deterioration in the metallic work. The Drexel building, Fifth and Chestnut Streets, Philadelphia, was constructed in the years 1886-87. The speaker has removed portions of the ironwork in that building, and could see no deterioration whatever.

In the year 1891 the speaker made a cement floor and walk over a pipe-tunnel, the upper surface of which was exposed to all atmospheric influences. This floor was of cement concrete, about 4 inches in thickness, and had a span of about 5 feet. It was reinforced by bands of ordinary chicken-wire fencing, 16 inches in width, laid across the tunnel and spaced 16 inches apart. A bed of mortar, composed of cement and sand, about 1 inch thick, was laid upon a horizontal plank centre, and brought up flush with the top of the side walls of the tunnel. Over this mortar the chicken-wire was laid, extending over the side-walls. The cement-concrete floor, 3 inches in depth, was laid upon this chicken-wire, and finished, the walk being about 7 feet wide. Although this walk has been in use for eleven years no deterioration is apparent, nor has there ever been any leakage even during the most severe storms.

In relation to this, attention is called to what the speaker considers faulty construction. The concrete floors of most office buildings are of cement and ashes or cinders. The resultant concrete is not impervious. The large quantity of

water used in construction is retained within the exterior skins of these floors for a long period, and no doubt is a detriment to the metallic construction of the floors.

In the year 1884 the speaker constructed a waterworks well at Redbank, N.J. This well was some 15 feet in interior diameter, and was sunk from the surface of the ground to a depth of about 60 feet. The lower half, or 30 feet, was below the ocean level, and the entire well, to within 5 feet of the surface of the ground, was under the ground-water level. The water rose in the well to within 8 feet of the surface of the ground, so that the well casing, 20 inches in thickness, constructed of hard brick laid in Portland-cement mortar, was continually in contact with water on both sides, and at times, even during construction, was under a pressure from the outside of more than 40 feet.

For reinforcing the brick shell during sinking,  $\frac{7}{8}$ -inch iron rods were extended from the cutting-curb upward through the masonry, and at intervals of about 6 feet large wrought-iron washers were placed over the rods and extended around the entire circumference of the well-casing. This construction was adopted to reinforce the green masonry of the casing during the operation of sinking. It would be interesting to examine this ironwork for the purposes of discussing this subject.

In the speaker's opinion the hue and cry raised in relation to a properly constructed iron skeleton in modern high buildings is without foundation.

In buildings where the ironwork is concealed within fire-proofing or concrete, there is little reason to suppose that any deterioration takes place, and the speaker will venture to state that, if the temperature and the humidity of the atmosphere immediately adjacent to the metallic structural work were observed and recorded, there would be found but little, if any, difference throughout the year.

Greater care, and concrete richer in cement, should be used for subterranean and subaqueous composite construction, and in some cases it would be advisable to use an asphaltic concrete so as to absolutely prevent the possibility of any moisture coming in contact with the metal.

The numerous cases of electrolysis in subterranean metallic pipes suggest a criticism which has not as yet been presented to the speaker. Is it not possible that, in subterranean and subaqueous work, metal, even when constructed in cement concrete, may be subject to electrolysis similar to that experienced in metallic water and gas-pipes? The speaker is of the opinion that all such subaqueous and subterranean constructions should be laid, as heretofore indicated, in an asphaltic concrete, and efforts should be made to force our legislators to pass laws preventing the use of the ground for an omnibus commercial electrical conductor.

We can also substitute for cast and wrought-iron pipes a cheaper and more permanent conduit, constructed under the composite system. The capacity of metallic water-pipes is materially diminished by the formation of nodules on their interior surfaces, and with some waters the life of iron pipes is merely a question of a very few years.

Composite pipes, constructed of concrete reinforced by metal, can be constructed so as to have the necessary strength without the loss of conductivity due to the metal nodules, and it is not necessary that the concrete of which they are composed should be of such richness as to absolutely prevent at first the transmission of moisture, except when the liquid conducted is free from suspended matter. Conduits carrying either turbid water or sewage soon fill up the pores in the concrete and make it impervious.

In 1894 the speaker constructed a septic tank for the Insane Asylum at Wernersville, Pa. The diameter of the tank was 25 feet, and the depth of water was 14 feet. The well was constructed of hard brick, laid in Portland cement mortar, and had a maximum thickness of 21 inches. There was an inside coating of plaster,  $\frac{3}{4}$  inch thick, made of equal parts of Portland cement and sharp sand. Tests were made through a period of ten weeks, at the end of which time masonry was practically impervious.

There is a paucity of experimental knowledge as to the strength of composite construction; the field is wide, of great importance, and deserves the attention and study of the members of our profession.

Before closing, the speaker would suggest that further experiment be instituted as to the possibility of making a metallic weld to avoid as much as possible the use of bolts and rivets. He is aware that the electric weld does not give a resultant value of 100 per cent., but he is of the opinion that the Society would be gratified with a knowledge of the best results so far obtained.

(To be continued.)

**The Venetian Municipality**, it is understood, will have to bear the cost of the re-erection of the Italian Campanile without any aid from the Italian Government.

## TESSERÆ.

### Sta Sophia.

THE progressive changes in domical edifices, from the circular drum, supporting a dome of equal diameter, as in the Pantheon, to the octagonal base, as in the temple at Spalato, to the square base with pendentives in the four corners, and, finally, to that triumph of constructive skill, the church of Sta Sophia, where a vast cupola rests upon arches springing from four piers only, furnishes the most interesting and instructive example of the successful development of general forms in Byzantine architecture. In the magnificent Christian temple built by Justinian we find the largest attainable space devoted to the celebration of ceremonies in which one vast congregation was expected to unite. Fergusson remarks "that no domical building of modern times can at all approach Sta Sophia, either for appropriateness or beauty; and that, if we regard it with a view to the purposes of Protestant worship, it affords an infinitely better model for imitation than anything our own Mediæval architects ever produced." It would, indeed, be impossible to imagine a scene of more impressive grandeur and of more religious solemnity than this vast building during the nights of the Mohammedan festival of the Ramazan, lighted by innumerable lamps, glittering in the spreading vaultlike stars in the firmament, the area thronged by thousands of earnest worshippers, prostrating themselves as one man under the guidance of the one leader of their prayer. The gradual corruption of Roman art, less distinguishable in the general forms, may be traced with the greatest minuteness in the details. Thus the architectural ornaments of the church of St. John at Constantinople (built between the time of Constantine and Justinian) form the link between the more Classic forms of pagan Rome and the frieze and entablature of the bastard Ionic order of the church of Saints Sergius and Bacchus, and of the bastard Corinthian of Sta Sophia. After the erection of Sta Sophia further modifications took place, but the essential features of the corrupted Roman style were still preserved.

### Keynsham Church.

The date of the foundation of the parish church of Keynsham, the tower of which is a familiar object to travellers between Bath and Bristol, is unknown, but it was appropriated to the neighbouring abbey in the year 1292. The oldest portion of the building, and probably coeval with its foundation, is the chancel. This is Early English in character; in its north and south walls are lancet windows, but all blocked up to afford space for mural monuments within. The awful accident which destroyed the ancient tower, and led to the erection of the stately western one, beneath which is now the principal entrance to the church, is described in a most rare and curious Church-brief, issued in the ninth year of Charles I., for the reparation of the fabric. It is stated in that document that "the parish church of Keynsham, a very fayre, large and substantiall church, and a great ornament to the sayd towne, is lately most lamentably ruined by reason of a most disasterous misfortune by tempestuous weather, happening upon the thirteenth day of January 1632, which continued in a most fearfull manner, being intermixed with hideous clapps of thunder and flashes of lightning, about sixe of the clocke in the afternoon of the same day, and by reason of the force thereof in a moment threw downe the steeple or spire of the tower, which with the fall thereof crushed downe likewise the greatest and principallest parte of the body of the said church, chancel, vestry, pulpit and seates, and defaced the pavement also. And the tower being therewith erased from the top to the foundation, and the glasse windows for the most part utterly rent and torne; and that part which is standing is subject to a further ruine unlesse some speedy course bee forthwith taken. The repaying of which ruynes and decayes as aforesayd, by the judgment of men well experienced in such workes, will amount unto the summe of sixe hundred nynety, or seaven hundred pounds at the least. The said parishioners being men of small ability (they for the most part being poore handicraftsmen) are of themselves, though willing, utterly unable to undergoe this so great a burthen, and are likely by reason of their inability to become destitute of a church for the celebration of Divine worship. And therefore they have most humbly besought us, &c. The repairs from the proceeds of this brief took place in 1634. The new west tower was erected chiefly from material afforded by the ruins of the adjoining abbey church. The noble tower is of mixed Perpendicular and debased work, but very effective in its general character.

### The Faun of Praxiteles.

The being represented is endowed with no principle or virtue, and would be incapable of comprehending such, but he would be true and honest by dint of his simplicity. We should expect from him no sacrifice or effort for an abstract cause; there is not an atom of martyr's stuff in all that softness of marble, but he has a capacity for strong and warm attachments and might act devotedly through its impulse, and even die for it at need. It is possible, too, that the faun might be educated

through the medium of his emotions, so that the coarser animal portion of his nature might eventually be thrown into the background, though never utterly expelled. The animal nature, indeed, is a most essential part of the faun's composition, for the characteristics of the brute creation meet and combine with those of humanity in this strange yet true and natural conception of antique poetry and art. Praxiteles has subtly diffused throughout his work that mute mystery which so hopelessly perplexes us whenever we attempt to gain an intellectual or sympathetic knowledge of the lower orders of creation. The riddle is indicated, however, only by two definite signs—these are the two ears of the faun, which are leaf-shaped, terminating in little peaks, like those of some species of animals. Though not so seen in the marble, they are probably to be considered as clothed in fine downy fur. In the coarser representations of this class of mythological creatures there is another token of brute kindred—a certain caudal appendage, which, if the faun of Praxiteles must be supposed to possess it at all, is hidden by the lion's skin that forms his garment. The pointed and furry ears, therefore, are the sole indications of his wild, forest nature. Only a sculptor of the inest imagination, the most delicate taste, the sweetest feeling and the rarest artistic skill—in a word, a sculptor and a poet too—could have first dreamed of a faun in this guise, and then have succeeded in imprisoning the sportive and frisky thing in marble. Neither man nor animal, and yet no monster, but a being in whom both races meet on friendly ground. The idea grows coarse as we handle it, and hardens in our grasp. But if the spectator broods long over the statue he will be conscious of its spell; all the pleasantness of sylvan life, all the genial and happy characteristics of creatures that dwell in woods and fields, will seem to be mingled and kneaded into one substance, along with the kindred qualities in the human soul. Trees, grass, flowers, woodland streamlets, cattle, deer and unsophisticated man. The essence of all these was compressed long ago, and still exists within that discoloured marble surface of the faun of Praxiteles. And after all the idea may have been no dream, but rather a poet's reminiscence of a period when man's affinity with nature was more strict, and his fellowship with very living thing more intimate and dear.

#### Influence of the Basilica.

The rise of the first edifice of Christian worship, not out of the Jewish temple or even the Jewish synagogue, but out of the Roman hall of justice, may be regarded as no inapt illustration of early Christian history. We are often reminded, both *bonam et malam partem*, by the polemics of opposite schools of the identity of early Christian customs and institutions with those of the older dispensation. Few topics have been more popular in modern times, whether in praise or blame, than the Judaic character of the worship, ministry and teaching of the three first centuries. But the indisputable share which the Gentile world has had in the material buildings of the Christian church, immediately suggests a doubt whether it may not have also contributed something to the no less complex structure of its moral fabric. The influence of Judaism on the first century was undoubtedly very great. On the one hand, the early sects had all more or less something of a Judaizing character; on the other hand, even the Apostles could not have been what they were had they not been Jews. But the fall of Jerusalem was in truth the fall of the Jewish world—it was in itself a reason for the close of the apostolic age—a death-blow to the influence of the Jewish nationality on the future fortunes of the world at large. Something, no doubt, both of form and spirit lingered on in the institutions of that great society which sprung out of its ruins; but Judaism itself had perished, and however much the mere ceremonial and superficial aspect of the Patristic age may bear a Jewish physiognomy, it is to the influences at work in the social fabric of the Roman Empire itself that we must seek the true springs of action in the Christian Church—so far as they came from any reign source. It is therefore with something more than a mere artistic interest that we find the bishop seated on the chair of the prætor—the forms of the cathedral already wrapt up in the halls of Æmilius and of Trajan. It is in exact accordance not only with the more general influence to which the Christian society was exposed from the rhetorical subtleties, the magical superstitions, the idolatrous festivals and the absolute habits of the heathen world at large, but also with the more especial influence which the purely political spirit of the Roman State exercised over some of their most peculiar institutions—with the fact that the very names by which the actions of their officers are described sprung not from the religious but from the civil vocabulary of the times—and are expressions not of spiritual so much as of political power. *Ordo* (the origin of our present "orders") was the well-known name of the municipal senates of the empire; *ordinatio* (the original of our "ordination") was never used by the Romans except for civil appointments; the "tribunes of the people" are the likeness which the historian of the Decline and Fall" and the author of the "Church of the

Fathers" alike recognise in the early Christian bishops; the preponderance of the Gentile spirit of government and the revival of the spirit of the Roman Senate in the counsels of Cyprian was the thought which forced itself on the mind of the last English historian of Rome in spite of many earlier prepossessions; even the Papacy itself, according to the pregnant expression of Hobbes, which, however inadequate as a complete account of it, is yet true as far as it goes, was but "the ghost of the dead Roman Empire sitting upon the grave thereof." The free spirit of the Roman citizen felt that it could breathe nowhere so freely as in the bosom of the Christian society. The Christian minister felt that no existing office or title to power was so solemn as that of the Roman magistrate, and Christianity could pay no more striking act of homage to the greatness of the expiring Empire than in this declaration of this belief, unconscious if we will, that the hall of Roman justice was not too secular for a place of Christian worship.

#### The Aquitanian Style.

The Aquitanian architects of the later Roman period seem to have altogether forsaken the traditional type of church handed down from the basilicas, which had existed in earlier times, and which afterwards came in again. The churches of southern Gaul during the twelfth and thirteenth centuries forsook the received type of nave and aisles, of pier-arch, triforium and clerestory, which runs through all other western Mediæval architecture irrespective of time and place. They rejoiced in enormously wide naves, without aisles, composed of a few very wide bays, and in the most perfect examples each compartment is covered with a dome. This arrangement seems to have gradually supplanted the older arrangement which lasted down to the eleventh century. The great abbey of Saint Sernin at Toulouse—the chapel of the White Tower on a gigantic scale—with its pier-arches, triforium and barrel-vault, is a manifest case of transition between the two. This church was consecrated by Pope Urban II. in 1090. In the course of the next century the other form became predominant. We see it in its perfection in the cathedral of Angoulême, and, with a more distinctly Byzantine character, in the domical parts of the famous Saint Front of Périgueux.

#### Royal Scottish Academy.

SIR,—Allow me to correct some inexcusable mistakes which occur in a short paragraph regarding the Board of Manufactures which appeared in *The Architect* of Friday last. I say inexcusable mistakes, because a writer so ignorant of the position and aims of the Scottish Academy ought to have refrained from commenting on these till the report of the committee of inquiry had been published and laid before Parliament. When that has been done, I may have more to say on the subject, but meantime I shall only refer to two misstatements.

We are told that the occasion of the pending inquiry "has been seized by the Royal Scottish Academy to make an effort to become free of the tutelage of the Board." That is absurd, as the Academy is not and never was under the tutelage of the Board. The Academy did not go before the committee, as you assert, to ask anything for itself except that its existing rights should be respected, but as the representative art body in Scotland, and under a proper sense of its charter obligations in that respect, it felt bound to avail itself of the opportunity to protest against the continued neglect by Government of the interests of the Scottish National Gallery, and to claim that it should be put on a footing not less favourable than that of the National Gallery of Ireland, both in respect of accommodation, annual grant and administration.

The Royal Hibernian Academy, to which you make reference, receives an annual grant of 300*l.*, while the Royal Scottish Academy receives no grant and has asked for none; but notwithstanding this, it has not "insisted that it should be emancipated from the duty of teaching," as you wrongly assert, nor has it suggested anything of the kind. It continues, as it has done for years, willingly and as a matter of duty to maintain a life school at a cost of nearly one-third of its annual income, where students who have given satisfactory evidence that they are sufficiently advanced to profit by it, receive free tuition.—Your obedient servant, JOHN HONEYMAN, R.S.A.

23 West Cumberland Street, Glasgow:

October 28, 1902.

#### Consulting Electrical Engineers.

SIR,—As one of thousands deeply interested in the question of the propriety of architects and engineers receiving "trade or other discounts, or surreptitious commissions or allowances,

in connection with works they superintend," I congratulate the Council of the Institution of Electrical Engineers on the publication in your issue of the 24th of their rules governing consulting engineers, but it deeply concerns us to know whether these practices are indulged in or allowable in the case of architects and engineers other than "consulting." I am told it does occur.—Your truly,  
W. LECKIE.  
23 Brook Street, W. : October 27, 1902.

#### Glasgow and West of Scotland Infants Mistresses' Association.

SIR,—The above Association is anxious to arouse the interest of architects, and especially of those who have to do with school architecture, in regard to the construction of infant rooms, and with a view to this they have been advised to send you a copy of the resolutions passed at a meeting of the Association on Friday, 27th inst., in the Religious Institution Rooms, Glasgow. A paper on the subject had previously been read by Miss Thomson, F.E.I.S., Gorbals School, Glasgow. The resolutions are as follows:—

1. The infant department should be provided with a series of rooms. No large room.
2. The rooms should be:—
  - (a) Situated on the ground floor, having a sunny exposure.
  - (b) Nearly square, and accommodating not more pupils than the number fixed by the code for a certificated teacher.
  - (c) Constructed so as to allow the same floor space as for older pupils.
3. For teaching drawing, blackboards should be fixed along the walls and additional movable apparatus supplied.
4. The drill hall should not be the well of the school and should be situated so as not to interfere with the work of the classes.
5. There should be sufficient cloakroom accommodation and wash-hand apparatus on the trough system.
6. In addition to the usual means of heating, there should be one or two fires in connection with the infant department.

The Association will be glad if you can see your way to insert this in an early issue of your paper.—I am, Sir, yours faithfully,

A. STUART PATERSON, hon. Secretary,  
Glasgow and West of Scotland Infants Mistresses' Assn.  
Dalmarnock School, Glasgow :  
October 27, 1902.

#### GENERAL.

**The King** has been graciously pleased to accept a portrait of the late Empress Frederick (when Princess Royal), drawn from life by the late Mr. E. M. Ward, R.A., in 1857. It has been presented by Mrs. E. M. Ward, the widow of the Academician.

**Her Majesty the Queen**, accompanied by Her Royal Highness the Princess Victoria, and attended by the Countess of Lytton, the Hon. Charlotte Knollys and the Hon. Sidney Greville, visited the French Gallery in Bond Street, and inspected the selected pictures and studies by Professor Corrodi, of Rome.

**Lieutenant-Colonel Horatio A. Yorke**, inspector of railways for the Board of Trade, told President Roosevelt that he had found many points of superiority in the American railways over the English, and had decided to recommend to the Board of Trade that several American appliances especially calculated to protect life and property should be adopted in England under statutory requirement.

**The Home Secretary** has appointed a committee to inquire into the use of electricity in mines and the dangers attending it, and to report what measures should be adopted in the interests of safety by the establishment of special rules or otherwise.

**Mr. J. H. Whitehouse**, hon. secretary of the Ruskin Memorial Scheme Committee, appeals for contributions towards the 3,000*l.* required for the completion of the village library, art gallery and museum at Bournville, of which Lord Avebury laid the foundation-stone last week.

**Sir Frederick Bramwell** has informed the Portsmouth Town Council that he is prepared to undertake for a fee of 500 guineas the work of advising the Council upon the question of removing the flooding in the low-lying districts of Southsea. If the work were entrusted to his firm the 500 guineas would be credited against the firm's fees of 5 per cent.

**The Nave** of St. John the Evangelist, Preston, Sussex, was dedicated on Sunday. The nave is over 100 feet long and 30 feet wide between the columns, the aisles being 12 feet wide, and the total width of the church is 60 feet. The roof principals are of pitch-pine, the remainder being executed in fir. The east end of the nave is surmounted by a bell turret of graceful design, the summit of which is 110 feet from the ground. The designs were prepared by Sir A. Blomfield & Sons.

**Mr. A. W. Ward** has been appointed deputy borough engineer of Portsmouth at a salary of 250*l.* per annum, rising to a maximum of 300*l.*

**The Exhibition** of the New English Art Club will be opened for private view on November 8 at the Dudley Gallery.

**The New Museum** of Egyptian antiquities in Cairo, which was designed by M. Marcel Dourgnon, of Paris, is to be inaugurated on November 15 in the presence of the Khedive.

**A Technical Institute** is to be erected in Poplar by the London County Council. The building will be opened in about twelve months' time, and will be used as a centre of instruction mainly for the mercantile marine and engineering and ship-building trades.

**M. Haniel**, a Prussian manufacturer, has presented the Mayor of Düsseldorf with 100,000 marks for the purchase of pictures and works of art for the municipal museum, in order to commemorate the great success of the exhibition held in Düsseldorf.

**The Bishop of Brisbane**, who has been in England for some months endeavouring to raise money for the building of Brisbane Cathedral, pleads for 7,000*l.* by the end of the year. The sum required for the first part of the building is 16,000*l.* in excess of what he has as yet received.

**Professor Dragendorff**, of the University of Basle, has been appointed Director of the Royal Commission of the German Imperial Archæological Institute.

**M. Leopold Bernstamm** has completed a bust of Antoine Rubinstein, pianist, which is to be placed in the Conservatoire of St. Petersburg.

**Mr. Pierpont Morgan** has lent his collection of pictures by Fragonard to the Glasgow Art Gallery.

**A Committee** has been formed, with Sir Thomas Drew as chairman, for the holding of an annual "winter exhibition" of Old Masters at the Royal Hibernian Academy, on the lines of those at Burlington House.

**Mr. T. Francis Bumpus** will shortly publish his "Holiday Rambles among the Cathedrals and Churches of Northern Germany" as a companion volume to his "Summer Holidays among the Glories of France." It will be amply illustrated.

**Mr. J. C. Hawkshaw** will deliver his presidential address to the Institution of Civil Engineers on Tuesday next at 8 P.M.

**The Archbishop of Cape Town** was present at a meeting of the Cape Town Cathedral Memorial Fund at the Church House, Westminster. He brought with him for the inspection of the committee the architect's drawings of the memorial chapel, and these drawings can now be seen at the office of the fund, Church House, Westminster.

**Purchase of the Royal Aquarium** site and buildings by the incorporated trustees of the Wesleyan Methodist Church has now been completed for 330,000*l.* Though the property comes into their possession at the end of January next, some months must elapse before the present building can be removed.

**The New Baths** at Small Heath, Birmingham, were opened on Wednesday. The buildings were designed by Mr. Henry Martin, and have cost 37,000*l.*

**A Meeting** of artists and others interested in artistic copyright was held on Tuesday afternoon at 39B Old Bond Street for the purpose of considering a proposal to form a society for the protection of British artistic copyright at home, in the Colonies and abroad. Mr. G. W. Agnew presided, and there was a good attendance. At the outset it was determined that the proceedings should be conducted in private.

**The Annual Report** of the Manchester Institution states that as the negotiations with the Manchester Corporation are settled, "it is hoped the committee will speedily decide what is to be the future scope of its work, so that there need be no delay in either extending the present galleries or building new ones, as soon as it has been decided whether or not an art gallery is to form part of new buildings on the Infirmary site."

**The Birmingham Corporation** adopted the following amendment on Tuesday:—"That the consideration of the report of the general purposes committee so far as it relates to the continuation of Corporation Street be deferred until the committee has had an opportunity of communicating further with the Local Government Board on the matter."

**The Annual Report** of the Manchester paving, sewerage and highways committee, which has been prepared, gives some interesting particulars about the cost of repairing and maintaining street pavements during the year. In the Manchester district 12,274*l.* was expended, in Chorlton 4,594*l.*, Hulme 4,784*l.*, Ardwick and Beswick 2,071*l.*, Bradford and Clayton 1,617*l.*, Newton Heath 1,486*l.*, Blackley and Moston 3,367*l.*, Crumpsall 547*l.*, Cheetham 3,620*l.*, Harpurhey 348*l.*, Openshaw 812*l.*, Gorton and Kirkmanshulme 5,186*l.*, Rusholme 2,416*l.* The total thus expended is 43,122*l.* During the year 1 mile 511 yards of new sewers was laid, at a cost of 4,202*l.*

THE

**Architect and Contract Reporter.****EDITORIAL NOTICES.**

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

**TENDERS, ETC.**

*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

**COMPETITIONS OPEN.**

**ASHTON-IN-MAKERFIELD.**—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

**CAPE TOWN.**—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

**ECCLES.**—Dec. 12.—Plans are invited for the laying-out of an area of land and for erection of dwellings for the working-class on part of such area. Premiums of 50*l.*, 30*l.* and 15*l.* will be awarded in respect of the plans placed first, second and third in order of merit. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

**DURBAN (NATAL).**—Dec. 18.—Designs are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

**HOLYHEAD.**—Dec. 2.—Sketch designs are invited for schools and a teacher's house. The competitor whose designs and terms are approved and accepted by the Board will be appointed the architect. Mr. R. E. Pritchard, clerk, Holyhead.

**HULL.**—Jan. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

**WAVERTREE.**—Plans are invited for erection of a church in Wavertree, Lancs, to cost 8,000*l.* Premium of 50*l.* offered for the selected design. Mr. E. Rogers, Crossley Buildings, South Castle Street, Liverpool.

**CONTRACTS OPEN.**

**BARNESLEY.**—Nov. 11.—For erection of outbuildings and conveniences at the Locke Park. Mr. J. Henry Taylor, borough surveyor, Manor House, Barnsley.

**BILSTON.**—Nov. 3.—For carrying-out the alterations and extensions of Lower Gornal Robert Street Infants' School, Coseley. Mr. A. Ramsell, architect, 187 Wolverhampton Street, Dudley.

**BIRMINGHAM.**—Nov. 15.—For erection of sanitary outbuildings at the old school block at the workhouse, Gravelly Hill. Mr. Cooper Whitwell, architect, 23 Temple Row, Birmingham.

**BISHOP AUCKLAND.**—Nov. 6.—For erection of an administrative block, main pavilion, isolation pavilion, porter's lodge and outbathing block, laundry and disinfecting block, covered ways, boundary walls and fences, water supply, drainage, roads, &c., at the No. 2 isolation hospital buildings at Helmington Row. Mr. William Perkins, architect, Victoria Street, Bishop Auckland.

**BOOTLE.**—Nov. 17.—For erection of cart-sheds, store-rooms and boundary wall at the refuse destructor, Pine Grove, Bootle, Lancs. Mr. J. Henry Farmer, town clerk.

**BRAINTREE.**—Nov. 15.—For erection of new master's quarters, &c, at the workhouse, Bocking, Braintree, Essex. Mr. Fred. Smoothy, clerk, 1 New Street, Braintree.

**BRIDLINGTON.**—Nov. 4.—For erection of a small villa residence. Mr. Samuel Dyer, architect, 29 Quay Road, Bridlington.

**BRIGHTON.**—Nov. 5.—For alterations to part of the Royal Pavilion in Palace Place to adapt the premises to the purposes of a telephone exchange, &c. Mr. Francis J. C. May, surveyor, Town Hall, Brighton.

**BROMSGROVE.**—Nov. 15.—For erection of the first portion of the proposed new lunatic asylum on the Barnsley Hall estate, near Bromsgrove, Worcestershire. Mr. George T. Hine, architect, 35 Parliament Street, Westminster.

**BURTON-ON-TRENT.**—Nov. 5.—For overhead equipment of the tramlines, &c. Messrs. Kincaid, Waller & Manville, 29 Great George Street, Westminster.

**COALVILLE.**—Nov. 4.—For supply and delivery of the pipes and specials required in the construction of new waterworks. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

**COALVILLE.**—Nov. 4.—For supply and delivery of No. 192 sluice, air and reflux valves, No. 219 screw-down hydrants, No. 89 expansion joints, and No. 4 Deacon's waste-detecting meters, with other fittings, surface boxes, name plates and posts required in the construction of new waterworks. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

**Fig. 5 is an Illustration of "VERITY'S PATENT"****CHAIN OPENER AND FASTENER,**

Specially adapted to Stand Sheet Windows, or any ordinary windows hinged at or near the bottom, and opening inwards.  
Can also be made to fix on either right or left hand side when so ordered.

**Kindly write for Price List to the Makers:—****FRED VERITY & SON (late Verity Bros.)****CALL LANE, LEEDS.**

(1)

Fig. 5.

**STAGE PICTURES AND THEIR IMPORTANCE.**

THE tastes of playgoers are as various as their moods, but while one may like problem plays, and another comedy, they are all united in demanding that, whatever description of piece they may witness, it shall be suitably and liberally put upon the stage. Dress, scenery, furniture, all must be attractive and appropriate if a play is to give general satisfaction. A

**TRADE NOTES.**

IN view of the importance of technical education, Messrs. Andrew Handyside & Co., Ltd., of Derby and London, makers of steel bridges, roofs, buildings and structures, have just made arrangements for a number of their apprentices to attend evening classes in prescribed subjects at the Derby technical college, and in order to encourage them are paying half the

case in point is that of the witty comedy, "The Marriage of Kitty," which, after a long and successful run at the Duke of York's, has been transferred, with every sign of further success, to Wyndham's Theatre. Here the scenes are well contrasted: a lawyer's office—substantial, sober, comfortable and businesslike, and a salon in the house of Lady Belsize on the Lake of Geneva, of which the sketch conveys a good idea. The dainty furniture and draperies in this play were supplied by Messrs. Oetzmann & Co, of Hampstead Road, W.

fees and purchasing the necessary instruments and books for each apprentice for a term of three years. Apprentices who pass the prescribed examinations will receive increased wages, and be allowed to retain the instruments purchased for them.

THE tenth edition has just appeared of the useful little brochure which, under the title of "American Crop Movements," is issued by the London and Lancashire Fire Insurance Company. In this edition they have remodelled several of the tables in order to bring them quite up to date. For instance,

## ILLUSTRATIONS.

## MUNICIPAL BUILDINGS, DEPTFORD.

THE THREE PREMIATED DESIGNS: By (1) Messrs. LANCHESTER, STEWART & RICKARDS, (2) Messrs. S. B. RUSSELL & C. E. MALLOWS, (3) Mr. A. J. GALE.

DESIGN by Mr. A. BRUMWELL THOMAS.

Tables 3, 4 and 5 are now on the basis of the New Orleans Cotton Exchange figures, instead of following those of the *New York Financial Chronicle*, as hitherto; they have introduced the new metric system into their calculations to meet the present trading basis; and Table 18, dealing with the cost at carding engine head, has been converted into decimals as being more useful to the spinner. The tables deal with the cotton crop in its various phases, and as the company have received the best practical advice in their compilation, they cannot fail to be of material assistance to all in any way connected with the cotton business.

WE have received from Messrs. G. M. Restall & Son, of Soho Pool Wharf, Birmingham, a pamphlet descriptive of their new patent Coronation wood lathing, angle staves, &c. This lathing is intended for walls, ceilings and other purposes, and varies from 1½ inch to 3 inches in width, with an average thickness of ¾ inch. It can be supplied in almost any lengths up to 15 feet. It is dovetail grooved and V-edged, and if the pieces be kept about 3-16 inch apart from one another they will form such a key that it will be impossible for any ceilings to give way or crack, and if two wire nails are fastened in each joist the laths will not warp. The advantages claimed for this patent wood lathing are as follows:—Ceilings can be pricked up before the floors are laid down, and if necessary can be skimmed, as owing to the solidity of the laths, the nailing down of floor-boards will not disturb such ceiling. One inch in thickness of dry sand, mixed with any disinfectant or any insecticide, and laid on the top of the ceiling, will have a good sanitary result, as well as making the ceiling fireproof, and if Restall's fireproof quick-setting adamant plaster is used in the plastering, such ceiling will be (as far as it is possible), "fireproof," and will be cheaper than metal lathing. The patentees do not consider metal lathing fireproof, as it soon gets red hot, and helps to set fire to the joists and other timber. Ceiling joists or studding can be kept 2 feet or more apart, thus saving time and timber. The lathing being wide

and in good lengths, saves time in fixing. It also takes considerably less plaster than if ordinary lathing were used.

## VARIETIES.

AT Grays, in Essex, a working men's club is about to be erected. Mr. M. Shiner, of 8 Crutched Friars, E.C., is the architect.

A NEW Wesleyan lecture-hall and classrooms, costing 2,500l., has been opened at Barton-on-Humber. There is 1,210l. to raise.

ABINGDON school has been extensively enlarged; and the new buildings were opened by the Lord-Lieutenant of Berkshire on the 22nd inst.

THE King has granted permission to Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee, to wear the decoration of the Red Cross recently conferred upon him by the German Emperor.

THE new dry dock of the Tredegar Dry Dock and Wharf Company was opened on the 25th inst., when the Mayor of Newport (Mon), laid a memorial-stone recording the event. The new dock, which is built to accommodate the largest cargo steamers afloat, is 708 feet long and 65 feet wide, and by the use of intermediate gates can be converted into two docks, one 358 feet long and the other 348 feet.

THE new public dispensary erected adjacent to the Royal Alexandra infirmary, Paisley, was formally inaugurated on the 24th inst. The building, which has been erected as a memorial of the late Queen's diamond jubilee, is a commodious structure, so arranged internally that visitors enter at one end, presenting their tickets at an office, then pass into a waiting hall. From here in turn they go into the doctors' consulting rooms at the other end, get their advice and prescriptions, pass on to the dispensing department and thence out by another doorway.

THE parish church of Llanllwchaearn has now been reopened. The renovation was associated with the Coronation of His Majesty the King, and was carried out under the personal direction of Mr. E. Parke, architect, of the same place. The chancel has been lined with old oak panelling and an old oak altar and reredos have been erected to commemorate the reign of Queen Victoria. The reredos consists of a fine piece of carved moulding, after a design by Pugin which surmounts seven panels of Gothic tracery, which belonged

THE BERKEFELD FILTER CO. Ltd. 121 OXFORD STREET, LONDON, W.

formerly to Welshpool Church. The altar is ornamented with seven similar panels of tracery.

THE foundation-stones of the new Baptist schools, Grove Road, Lowestoft, were laid on October 23. The schools, which are being erected on a site at the back of the existing church and vestries, include large schoolroom, church parlour, infants' room, kitchen, six independent classrooms and three other classrooms, capable of being thrown open into schoolroom by means of swivel partitions. Suitable lavatory accommodation is provided. The building is faced externally with red brick, the dressings being of white Costessey work. The design is of Late Gothic. The contract is let to Mr. Charles E. Earl, and amounts to 1,338*l*. The architects for the above new buildings and for the church (recently completed) are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, London, W.C.

THE directors of John Brown & Co., Atlas Works, Sheffield, and Clydebank, Glasgow, announce that an agreement has been made for an amalgamation of interests with the well-known steel manufacturers, Thomas Firth & Sons, Ltd., of Sheffield. Under the agreement seven-eighths of the Ordinary shares of Firth & Sons have been acquired by John Brown & Co. in consideration of the transfer to the shareholders of the former company of 90,000 Ordinary shares of 1*l*. each fully paid and 24,000 Preference shares of 10*l*. each fully paid of the latter company. The directors of John Brown & Co. state that, having regard to the profits made by Firth & Sons, the acquisition of this large interest in the business of that firm will be beneficial to the shareholders of their own company.

COLONEL W. R. SLACKE, inspector of the Local Government Board, conducted an inquiry at the town hall, Stratford-on-Avon, on Tuesday, with reference to an application by the Town Council for permission to borrow 9,232*l*. for the purpose of effecting certain extensions and improvements at the gas-works. The town clerk explained that the gas undertaking was purchased by the Corporation in 1880. The works were continually growing, and large sums had been spent upon them from time to time. It was necessary now that new purifiers should be laid down, together with new feeding mains, and that other works should be carried out. As showing the increased consumption of gas, it was stated that in 1881 the consumption stood at about 28,000,000 cubic feet, whereas it was now considerably over 55,000,000. The inspector took formal evidence and examined the plans, and afterwards, accompanied by the chairman and the gas manager, paid a lengthened visit to the works.

THE Roman Catholic church of St. Patrick, in Trim, Ireland, is now completed. It is a fine building in the Early Decorated Gothic style, and comprises sanctuary, nave, transepts, side aisles, side chapels, nuns' choir and two sacristies, and heating chamber. The total length of the interior of the church is 137 feet 8 inches, and the width across transepts 77 feet, height from floor to ceiling 50 feet, length of nave 106 feet, and width 30 feet; width across nave and aisles 60 feet. The principal entrance to the church is through the tower porch. The tower itself, which is 25 feet square, rises to a height of 100 feet, with octagonal pinnacles at angles, surmounted by a spire 90 feet high. The total height of the spire from the ground to the top of the cross is 208 feet. The interior of the church is beautifully decorated, and the high altar, fashioned from Sicilian marble, is a beautiful work of art. The building was designed by the late Mr. W. Hague, architect, Dawson Street, and after his death the work was entrusted to Mr. W. H. Byrne, F.R.I.A., Suffolk Street. Mr. Patrick Nolan, Monaghan, was the builder.

THE new Roman Catholic church at Selly Oak, Birmingham, is now open for public worship. It is dedicated to St. Edward, and is situated at the junction of Bournbrook and Elmdon Roads. The new building, the architect of which is Mr. H. T. Sandy, provides seating accommodation for about 500, and when fully completed will consist of a nave 82 feet long and 30 feet wide, two aisles equal in length to the nave, and an apsidal-ended chancel. At the east ends of the north and south aisles respectively will be the lady and Sacred Heart chapels, and at the west end of the nave a spacious vestibule, over which will be the choir and gallery. At the west end of the north aisle it is intended to build a tower, surmounted by a spire. The sides of the apse each contain a lofty, three-light traceried window, and the west gable is filled with an elaborate traceried window. The design of the church is in the Early Decorated style of English Gothic, and the building, which has been erected by Mr. W. Bishop, is mainly of brick with Bath stone dressings and faced externally with plaster.

THE lending department and news and periodical-rooms of the new free library at Leamington are now open to the public. The library, which has hitherto been housed in the town hall, is now accommodated under the same roof as the Municipal Technical Institute, and the joint buildings have been erected at a cost of 16,000*l*. The style adopted by the architect, Mr. H. Bottomley, of Leeds and Middlesbrough, is a free treatment

of the Renaissance, but the chief object in view has been to provide a commodious and substantial building rather than one with pretensions to architectural beauty. The accommodation provided for the library is particularly good, comprising a spacious newspaper reading-room, a comfortable periodical-room, and a well-equipped reference library. The arrangements for the lending library have been completely remodelled, and the indicator system has now, for the first time in Leamington, been adopted.

KIRKLINTON CHURCH, Cumberland, has now been reopened after having undergone interior renovation and decoration which have made it a very handsome place of worship. A new oak ceiling has been put in, new oak seats in both nave and chancel have been provided, a new pulpit has been erected, new floors have been laid down, a new heating apparatus has been introduced and the whole of the walls have been painted and decorated. The ceiling is provided with arched principals to encase the old ones and moulded purlins. The principals rest upon stone-carved corbels, the subjects of the carving being sacred emblems and monograms. The chancel seats have open traceried fronts, and are enclosed with a dwarf and carved screen resting upon a solid Devonshire marble plinth 8 feet long. On the screen is the carved motto, "Laudate Dominum, quia bonus Dominus; psallite nomini ejus, quoniam suave." The pulpit is panelled and traceried, and rests upon a plinth also of Devonshire marble. The space between the choir stalls is paved with marble and the altar step is of the same material. The nave seats are handsome and comfortable, those in the front being open and traceried. The walls of the nave are panelled round with oak, and the passages are laid with oak blocks. The total cost of the work has been about 1,100/. Mr. J. H. Martindale, of Carlisle, was the architect.

TRINITY CHURCH, Leeds, the new Congregational church which is being erected in Woodhouse Lane, is now nearing completion. Erected from designs by Messrs. Danby & Simpson, Trinity Congregational church is in the Perpendicular Gothic style, and this form of architecture is carried throughout a complete equipment of buildings, there being in addition to the church a large lecture-hall, vestries, classrooms and caretaker's house. The church consists of nave, aisles, transepts, chancel, and a tower and spire rising to 130 feet. The main entrance is approached by a flight of stairs leading to an outer vestibule, at what would be the west front were the building

oriented in the usual ecclesiastical style. As a matter of fact, it is south-east. Above is a nobly proportioned seven-light window, and there is a corresponding window at the chancel end. The latter is filled in with stained glass, and this is the case also with one of the series of two-light windows in what for convenience may be described as the south aisle. The pulpit is at the corner of the southern transept, and is of carved oak resting on a pediment of Caen stone, relieved with alabaster pillars. The fittings in the chancel, the choir stalls and the organ-case are also in carved oak, treated in keeping with the architecture of the building. The organ, by the way, is a reconstruction of the very fine instrument that formed a notable feature over the pulpit in East Parade chapel. Here it is placed on the northerly side of the chancel. The pews are of pitch pine, and give accommodation for over 800 worshippers. There are no galleries. Altogether the interior is as chaste and effective as the exterior is picturesque. The price paid for the site exceeded 8,000/., and a sum of about 15,000/. will, by the time all the contracts are settled, have been spent on the buildings.

THE new Pump Street Wesleyan church and schools were opened in Worcester on the 22nd, the occasion being one of rejoicing. The architecture of the church is of the late Gothic period, and the building, which will accommodate some 850 people, is cruciform in plan, having a chancel and two transepts. The entrance of the old church was by a narrow passage running parallel with High Street, but the new building is entered from Pump Street. A tower at the north-east corner gives the building a somewhat imposing appearance. A handsome vestibule on either side of the main entrance admits one to the body of the church, while there are separate entrances to the gallery. The interior is noticeable for an entire absence of that gloom which was so depressing a feature in the old place of worship. There are numerous windows, which are glazed throughout with cathedral lead lights of an artistic character. Side and roof ventilators provide for adequate ventilation, and the seating arrangements strike one as being convenient and comfortable. The pews, which are of the best selected pitch pine, are modern in shape. The body of the chapel is not overshadowed by the gallery, but there is about each an appearance of breadth and spaciousness. The choir seats are situated on either side of the pulpit, at the back of which is a roomy space for the communion table. The pulpit itself is of carved oak and set

on a stone base. To the left of the pulpit is an entrance to the preacher's vestry—a compact apartment—and on the right a vacant space is reserved for the organ. The new school premises consist of a large schoolroom 59 feet 6 inches by 36 feet 9 inches, four classrooms and infants' school, while on the first-floor there is a spacious church parlour with convenient cloak-room accommodation and lavatories adjoining. Each room is well lighted and ventilated, and the large schoolroom has four skylights. The church parlour is a very well-appointed room, with walls coloured in a pleasing shade. Electric light is installed throughout the buildings, which are heated by water apparatus. The designs of the church and schools were prepared by Mr. J. J. Green, architect, Adelphi Bank Chambers, Liverpool, and Mr. Wm. Hopkins, of Birmingham, is the contractor.

### ELECTRIC NOTES.

A LOCAL GOVERNMENT BOARD inquiry was held at the Guildhall, Nottingham, on the 21st inst., by Colonel A. J. Hepper, D.S.O., R.E., into an application by the City Council for sanction to borrow 35,500*l.* for purposes of electric lighting. Those present were Sir Samuel Johnson (town clerk), Messrs. F. B. Harris (assistant solicitor), H. Talbot (city electrical engineer), A. Brown (city engineer), T. W. Gordon (assistant engineer), J. E. Bryan (city accountant) and F. W. Fox (assistant accountant). The city accountant first informed the inspector that the assessable value of Nottingham was now 940,217*l.*, the outstanding loans under the Sanitary and Public Health Acts 1,113,463*l.*, and the population about 240,000. The town clerk explained that the application was to borrow two sums of 15,500*l.* and 20,000*l.*, which had been authorised by the City Council, for electricity purposes. The first was for a station at the Eastcroft, where the Corporation were now adopting new destructors. An understanding had been arrived at by the electricity and health committees by which certain things should be provided in the erection of the destructors so as to be available for generating electricity. The necessary power and steam would be taken from these boilers, and in order to accomplish that, it was necessary to spend 15,500*l.* at the Eastcroft. The site, added Sir Samuel, in reply to a question by the inspector, was their own freehold property, being one of the ancient estates of the Corporation, and speaking from recollection he believed it dated from the reign of

Henry VII. The other portion of the land was for the extension and laying of mains, as they might be required. Mr. Talbot said that there were now 2,060 consumers, including power and light. The 10,000*l.* which was borrowed in the early part of this year had already been spent in the laying of the mains, &c. The inspector afterwards went to look at the site.

THE town of Dorking is to be lighted by electricity. About an acre of ground has been acquired from Lord Ashcombe in Station Road in close proximity to the swimming-bath and the gasworks, on terms which the Urban Council regard as very reasonable. A road is to be formed from Station Road up to the buildings, which will occupy a most convenient situation, being within easy reach of the railway station for the cartage of coals, the chief requisite, and also near the Pippbrook stream where there is an ample supply of water. On the site will be placed an engine-house, boiler-house, accumulator-room, stores, showroom, workshop, &c., and a glance at the elevations at once dispels any fear of the buildings constituting anything approaching an eyesore, whilst they will provide all that will be required for such works and leave room for future possible extensions. Mains will at once be laid in Station Road, the whole of High Street, West Street, Junction Road, South Street, Horsham Road, Falkland Road, Harrow Road, Knoll Road, Rosehill, and along the London Road as far as the Star and Garter Hotel. Application has been made by the Council for sanction to borrow the sum of 20,000*l.* for the undertaking, and in due course a Local Government Board inquiry will be held.

### BUILDING AND BUILDERS.

THE foundation-stone of a new Victoria Hall was laid at the village of Kemerton, near Tewkesbury, on the 24th inst.

A NEW Wesleyan chapel is to be built at Swallowbeck, near Lincoln.

MEMORIAL-STONES of new Wesleyan Sunday schools, to cost 6,000*l.*, at Westgate Hill, Cleckheaton, have been laid.

THE chancel of Bangor Cathedral is to be completely renovated at the expense of Lord Penrhyn.

FOUNDATION-STONES have been laid of a Primitive Methodist school and vestries, to cost 1,100*l.*, in New Wellington Street, Grimsby.

## METAL WORK

BRATT COLBRAN & CO.  
10 Mortimer St. London.

THE dedication took place on Sunday at St. Bernard's Catholic church, Halifax, of a new high altar that has been erected at a cost of about 500*l*.

THE new Bradford Corporation fire-brigade station in Nelson Street, which has cost 16,000*l*. to erect, was opened on Tuesday by the mayor (Mr. W. C. Lupton).

A NEW Presbyterian church is in course of erection at Fuswell Hill, London. It will provide accommodation for 20 persons, and the cost is estimated at 11,000*l*., of which 3,000*l*. has been received.

AN addition is being made to the ancient parish church of Ackwood, near Knowle, from plans prepared by Mr. Chatwin, architect, of Colmore Row, Birmingham. An organ chamber, an estimated cost of about 300*l*., is in course of erection, and being built to harmonise with the present style of the old building. It is expected that the work will be completed before the end of the year.

THE new Roman Catholic cathedral of Leeds, the erection of which is due to the purchase of the site of the present one by the Corporation, will cost about 36,000*l*. The nave, aisles, side chapel and sanctuary will seat 850 people and the choir, exclusive of the canons' stalls. The choir and sanctuary, which is about 30 feet wide and 50 feet long, has an ambulatory round. The materials to be used are Weldon, Ketton and Ormsay Down stone. The paving of choir and sanctuary floor will be of marble.

THE Governors of the North Staffordshire infirmary have decided to erect a nurses' home in connection with that institution, in commemoration of the King's coronation, and the foundation-stone was laid by the Earl of Dartmouth. The new building, which is to be erected on a site adjoining the infirmary, will comprise 54 bedrooms for nurses and sisters, large sitting-rooms, library, capacious entrance-hall, cloak-room, cycle-room, servants' rooms, linen and box-rooms, 10 bath-rooms and the usual offices. The cost of the building, equipment and endowment is estimated at 10,000*l*.

THE foundation-stone has been laid of the new Theatre of Varieties in King's Road, Chelsea, S.W. The theatre, which is being built from the designs of Messrs. Wylson & Long, will be opened at Easter. It has a frontage of 106 feet in the main road and a depth of 150 feet. The front has been designed in a free Renaissance style, and the elevation is 55 feet to the parapet, above which a central dome rises to a further height of 32 feet. The auditorium is 64 feet wide, and

the height from the pit floor to the ceiling is 46 feet. The dimensions of the stage are 80 feet by 31 feet, and the proscenium opening measures 30 feet. The designs indicate that the building will be a handsome addition to the many variety halls erected in the outlying districts of London.

THE housing of the working classes committee of the London County Council have had plans prepared for a women's small model lodging-house to be erected in connection with the scheme for the clearance of insanitary areas in Webber Row, Wellington Place, and King's Bench Walk, Southwark. This locality, it is thought, affords exceptional advantages for the erection of a small women's lodging-house in connection with the block of dwellings and shops it is proposed to erect on the area. The lodging-house will be of four storeys for fifty-seven women on the cubicle system, with a common dining-room and sitting-room, and will occupy a small portion of the whole area. By managing the lodging-house and dwellings in combination it will be possible to effect considerable economies. The architect has also submitted drawings showing how the remainder of the site may be utilised for five-storey block dwellings and shops. The accommodation proposed to be provided is as follows:—101 two-room tenements, 202 rooms; 144 three-room tenements, 432 rooms; total, 634 rooms, accommodating 1,268 persons. There will thus be a total accommodation for 1,325 persons, as against 997 displaced by the scheme. In addition there would be ten shops and a store for administrative purposes in the rear. The cost is estimated at 79,176*l*. The rent proposed to be charged for the lodging-house is 6*d*. per night for the single cubicles and 9*d*. per night each for the three double cubicles, which will be suitable for a woman and her daughter, or two sisters or friends. The rents of the tenements would average 3*s*. 1*d*. per room per week. This, although somewhat high, compares favourably with the rents at the Borough Road dwellings and the Green Street and Gun Street dwellings, which average 3*s*. 8*d*. and 3*s*. 1*d*. per room per week respectively.

#### AUSTRALIAN LAND REGISTRATION.

THE absence of litigation with respect to titles to land is a marked feature of the Australian judicial system and is a result of the general adoption of the Real Property Act as devised by the late Sir R. R. Torrens, and which first came into opera-

tion in South Australia. It was introduced into New South Wales in 1862 and completely revolutionised the procedure in regard to land transfers, which until that date had been largely modelled on law existing in England. The leading features of the Act are, according to the New South Wales Government Statistician, the transferring of real property by registration of title instead of by deeds, the absolute indefeasibility of the title when registered, and the protection afforded to owners against possessory claims, as a title issued under the Act stands good notwithstanding any length of adverse possession. From the passing of Torrens's Act all lands sold by the Crown were conveyed to the purchasers under its provisions, and the provisions of the old law were restricted to transactions in respect of grants already issued. The area for which grants under the old system had been issued in 1862 was 7,478,794 acres; since then 1,385,040 acres have been brought under the provisions of Torrens's Act, so that the area still under the old system is 6,093,754 acres. Lands are allowed to be placed under Torrens's Act only when their titles are found to be unchallengeable; but thousands of acres are brought under the Act during the course of every year, so that it is merely a question of time when the whole of the lands of the State will be under a uniform system. For the whole period during which the Real Property Act (Torrens's) has been in operation 19,808,732 acres of Crown lands, valued at 21,477,390*l.*, have been conveyed under its provisions, and 1,441,917 acres of private lands, valued at 24,050,563*l.*, have been brought under it, the whole representing fully 21,250,649 acres, value 45,527,953*l.* One result of the Real Property Act is that in New South Wales, as in other parts of the Commonwealth, land is bought and sold with the greatest ease. The fees paid for registration are, after certain deductions have been made, devoted to a fund for compensating any holder of a registered title whose claim, by reason of some informality, may prove invalid, but such is the care exercised before a title is granted that instances of this character are almost unknown. Every change of ownership, in whole or in part, has to be inscribed on the title. Thus, if the holder of five acres sells a couple, he has to return his deed, which is replaced by a fresh one showing him to be the holder of three acres, a second one being issued to the purchaser giving him a title to two acres. Thus each deed shows only what land the holder is actually entitled to under its provisions. In this way all disputes respecting land ownership are avoided. When it is desired to bring private lands under the Real Property Act, due notice,

with all documents and necessary information, must be supplied to the Registrar of Titles. If these prove satisfactory particulars of the application are published in the State Government "Gazette" and certain local newspapers, and all objections, if any, have to be lodged by a given date with the Registrar. If any objections are made they are duly inquired into, but if none are forthcoming the deed of title is forthwith prepared. All mortgages have to be registered, and where they are granted on land brought under the Real Property Act, the amount and other details are stamped on the back of the deed of title, otherwise the mortgage becomes invalid so far as the land is concerned. The deed is held by the mortgagee, but he can do nothing without the consent of the mortgagor unless the latter fails in the fulfilment of his contract, in which case the mortgagee can, after certain legal formalities are complied with, obtain possession of the land, a fresh title, or notice of transfer, being supplied him. This obviates the necessity for legal proceedings. When the mortgage has been discharged, the stamped details at the back of the deed of title are marked as being cancelled. If a deed of title is lost, stolen, or destroyed, it can be replaced by a copy marked as a duplicate, and consequently not readily negotiable, but the number of such duplicates is extremely limited.

### CHILDREN'S HOMES, SIDCUP.

In 1899 a site of 62 acres, with a substantial old residence, at Halfway Street, Sidcup, was acquired by the Greenwich Board of Guardians at a cost of 250*l.* an acre, with the residence given in. School homes on the cottage principle, as opposed to the old barrack construction, have been erected thereon by the Guardians for 525 children from the designs of Messrs. Thomas Dinwiddy & Sons, of Greenwich and 54 Parliament Street. A portion only of the site has been used, upwards of 20 acres being in reserve for ultimate building development.

The buildings, which are already in full occupation, are of considerable extent and comprise 24 different blocks, including swimming bath, gymnasium, &c., and were publicly opened by the Chairman of the Board on Thursday last.

The contractor was Mr. T. Rowbotham, of Birmingham; Messrs. Moorwood & Sons, for the engineering; Messrs. Johnson & Phillips, for the electric-light installation; and Messrs. Tilley & Son, for well and pumping machinery.

## WARRINGTON'S NEW TECHNICAL SCHOOLS.

THE new technical schools situate in Palmyra Square, Warrington, were opened on the 28th inst. by Lord Derby. The buildings cover about a quarter of an acre, and have been erected to afford accommodation for some 500 students in suitable rooms furnished for their different uses and purposes. The laboratory of the biological department is 27½ feet by 20 feet, whilst the measurements of the laboratory and the lecture-room of the chemistry department are 48½ feet by 36 feet and 27½ feet by 27½ feet respectively. For the chemistry department there are also lecture, preparation, class, special, dark reagent's and balance-rooms. The domestic department contains washing, ironing, cooking and sewing-rooms of excellent dimensions, whilst workshops, laboratories, drawing offices, lecture and preparation-rooms have been provided for the departments relating to engineering, plumbing, mechanics, physics and woodworking. In addition, there are classrooms and reading-room, and for the control and management an office, committee-room and masters and mistresses' rooms and stores. Through the main entrance from Palmyra Square is a crush hall, with inquiry office, committee-room and students' room, the remainder of the floor being occupied by the domestic department. The chemical and biological departments are on the first floor, whilst on the lower floor are the rooms for engineering, plumbing, mechanics, physics and woodworking. The electric lighting, heating and ventilation of the building have had very careful attention, and gas and electric-power mains have been laid on for use in practical experiments and for motive power. As a technical school the buildings are complete, but it is under the consideration of the Corporation to perfect the original scheme by erecting a continuation school and pupil teachers' centre at the rear, and the corridors have been so arranged that the necessary intercommunication will be easily arranged. In the further scheme is included a lecture-room of good size, which can be used by different departments, and which itself can also be used in connection with the Parr Hall, or by the public through its connection with the Parr Hall without disturbing the schools. The front of the building in Palmyra Square has been set back 10 feet to allow of ample light to the windows of the lower rooms, and as those rooms are lofty the level of the main floor is lifted considerably above Palmyra Square. The general design of the building is in later English Renaissance, the main weight of

the treatment being kept to the central doorway, and a little richness has been added to the simple treatment of the front by the introduction of carved brick panels, on which are cut the names of scientists and philosophers. The architects for the building are Messrs. William & Segar Owen, of Warrington, and the building has been erected by Mr. C. W. Davenport, of Stockton Heath.

## AUSTRALIAN SOFT WOODS.

THE heavy timbers in which Australia is so rich have become famous for their exceptional hardness and durability, but comparatively little is known outside the Commonwealth of the numerous soft woods admirably adapted for the manufacture of furniture and for other industrial purposes. Such timbers are abundant in New South Wales, and are found principally in the immense brush forests of the coastal districts. Several of these timbers have a wood grained and marked most beautifully, and capable of receiving the highest polish, while others are fragrantly perfumed. Amongst the chief varieties of woods of this class may be mentioned the red cedar, the beautiful wood of which is admirably adapted for the finer kinds of cabinet-makers' work. Some of the cedar trees grow to immense size, as much as 2,500 cubic feet of valuable timber having been obtained from one tree. In addition to the cedar may be mentioned tulipwood, yellow wood, white maple, myall, marble wood, mock orange and many others. Besides their use for cabinet making, many of the brush timbers are of great utility for the rougher kinds of carpentry, while some, both hard and soft woods, are admirably adapted for coach-builders' and coopers' work. The chief description of pine growing in New South Wales is the Moreton Bay white pine, found in the coast districts as far south as the Bellinger. It is soft, light and easily wrought, and suitable for all the interior woodwork of houses, as well as for cabinet making. The red or black pine is extensively distributed over the Liverpool Plains and in the Lachlan and Darling River districts, as well as around Berrima. It is beautifully marked in the grain, takes a fine polish and has an agreeable fragrance. There are numerous other varieties of pine, but these resemble in their main features the trees already described. Australian deal is an excellent timber, and is obtained in very large scantling, the tree frequently reaching

120 feet in height. It is soft, close-grained, easily wrought and remarkably free from knots. Its use, therefore, is extensive for cabinet-makers' work and house fittings. The New South Wales Government Statistician mentions several of the more useful of the soft and fancy woods of the State. They include the beech, which attains a height of 100 to 150 feet, with a diameter of 3 to 5 feet, giving a strong, white, close-grained and durable wood, easily worked and greatly valued for decks of vessels, flooring, turnery and furniture-making; the black bean, growing to a height of 120 to 130 feet, with a diameter of from 4 to 5 feet, with a handsome, close-grained, dark-coloured, durable wood; the black oak, used for bullock yokes, tool handles, shingles, &c.; and the blackwood, resembling walnut, and highly valued for making furniture. Another valuable timber is the rosewood. It is strong-grained and durable, with a colour resembling Spanish mahogany. Among other woods may be mentioned the silky oak, which attains a height of 70 to 80 feet. The colour is a light grey, beautifully crossed with silvery waves, and when polished the surface has a delicate lustre. Bedroom suites made from this wood possess a dainty appearance. Satin-wood is another useful timber, yellow in colour. It is soft and silky to the touch, close-grained and easily wrought. This wood is also suitable for cabinet-making and is considered to be superior to the satin-wood used in the European and American furniture trade. When the system of forest conservation becomes more general in the State the supplies of many of the timbers mentioned will become practically inexhaustible, and are certain to be in large demand for export purposes.

### WYCLIF CHURCH.

WYCLIF CHURCH, Newcastle-on-Tyne, was opened on the 16th inst. The style of this building is Perpendicular Gothic, freely treated. The accommodation is for 306 adults, or for a mixed congregation of about 350. Provision is made for a future end gallery to seat 100 adults or 120 in a mixed congregation. Total, 470 in the completed structure. The choir is on the platform in front of the pulpit, and the baptistry is in the platform, covered when not in use. The organ is in an apse behind the pulpit. The building consists of a wide nave with hammer-beam open-timbered roof. There are double transepts on each side, with timber arches supported on iron columns, and each transept is lighted with a three-

light traceried window. Two two-light traceried windows are in each side of the wall of the nave. There is a spacious projecting portico in front, with vestibule and inner lobbies. On one side is a vestry, and on the other side a staircase in the tower, which gives access down to the schoolroom, and will give access up to the gallery when it is constructed. There is also a staircase on each side of the pulpit down to the schoolroom, and the minister's and deacons' vestries. The ladies' vestry is behind the pulpit. The seating is arranged semicircularly, so that every hearer directly faces the minister. The heating is by hot-water pipes and radiators. There is an exit door from tower, and another from the back into Northbourne Street. The two front entrances are from Elswick Road. All the doors open outwards. The schoolroom is spacious, and there are also under the church a church parlour, 19 feet by 13 feet, a heating chamber and lavatories, &c. The schoolroom is well lighted with large windows into areas and streets, a ventilating flèche is placed on the roof to withdraw the heated air, with a gas accelerator to assist the upcast, and inlet shafts admit the fresh air. The seats have panelled sloping backs, with book racks, &c., varnished. The windows are glazed with lead lights, and the external walls are faced with red-pressed facing bricks, and have tawny terracotta dressings and tracery, &c. The contract for the building was 4,383 $\frac{1}{2}$ , including boundary walls, gates, railings, &c. The builder is Mr. A. Bruce, Newcastle, and the architects are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, London, W.C.

### FIRE DANGERS IN THE CITY.

In a report dealing with the existence of culs-de-sac in the City of London, the Fire Brigade committee of the London County Council point out that in their reports on the large fire which occurred in the Barbican in April last special allusion was made to the fact that the brigade was placed at a disadvantage in coping with the fire inasmuch as it was unsafe to place men and appliances in New Zealand Avenue, a cul-de-sac, the entrance to which was opposite to the premises in which the fire broke out. In their second report they stated that they shared the chief officer's opinion that the existence in the City of London of many culs-de-sac, of which New Zealand Avenue was by no means the worst example, constituted a grave source of danger, and they mentioned that they were consulting the Building Act committee generally on

the subject. That committee had now informed them that New Zealand Avenue was laid out in 1886 without application or sanction from the then existing Metropolitan Board of Works, and that the by-law, dated May 1, 1857, as to the formation of new streets in London, was not complied with in respect of New Zealand Avenue. The Building Act committee further stated that, having regard to the provisions of section 9 of the London Building Act, 1894, the Council would not now be entitled to refuse its consent to the formation of a street within the City on the ground that it would constitute a cul-de-sac. No list of the culs-de-sac in the City appeared to be in the Council's possession, and the preparation of a correct and complete list would necessitate a careful survey, but from an examination of the Ordnance sheets there would appear to be at least forty-five such places within the City.

### NORTHAMPTON MASTER BUILDERS' DINNER.

THE annual dinner in connection with the Northampton Master Builders' Association was held at the Plough Hotel Assembly Room, Northampton, on the 23rd inst. Mr. John Bird (president of the Association) presided, and was supported in the vice-chairs by Mr. W. Higgins (vice-president of the Association), Councillor A. J. Chown (a past president), &c. After the dinner the Chairman gave "The King," and also The Queen and Prince and Princess of Wales and the rest of the Royal Family," which were loyally honoured.

"The Army, Navy and Reserve Forces" was submitted by Councillor A. J. Chown, and Bandmaster W. Ashton, whose name was coupled with the toast, responded.

Mr. G. W. Souster proposed "The Mayor, Magistrates and members of the Corporation."

Councillor Green proposed "The Architects," and referred with pleasure to the presence of the borough surveyor.

Mr. Sidney Harris returned thanks, and said it was very gratifying to the architects to know that they were on such a footing of good fellowship with those on whom so much of their own success depended. The speaker also commented on the striking differences that were often to be noticed between the highest and lowest tenders for large contracts, and said it was regrettable.

Mr. G. H. Stevenson submitted "Success to the Northampton Builders' Association," and said there was no class of men who had to put up with such a number of worries and

cares as the builder, and the greatest worry, so far as his experience went, was in many cases owing to the want of ability in the men he employed. Half the loss and the whole of the worry which builders and architects had to put up with were owing to the incapacity of the men they employed. There were good men, but they were a small percentage. There was a good deal of talk about badness of trade, but he never met a really good man walking about doing nothing, and if men would only qualify themselves to do their work properly there would not be so many idling about and applying for relief.

The President, who met with a hearty reception, in reply, said the Association was a good deal of use in many ways. It brought the members together periodically, and kept them posted up in what was going on in the trade all over the country. It also tended to lessen any friction that might exist between the members and their employes—that was one of their principal objects. It had dealt in many instances fairly and equitably with disputes that had arisen which otherwise might have caused much friction in the trade. They were pleased to know that it was a successful Association, and everyone connected with it, he believed, did his best for its furtherance and for the furtherance of business in the town.

Mr. F. D. Jeavons submitted "The Town and Trade of Northampton," and said that every time he came to Northampton he noticed some improvement—it might be small, but it was always evident.

Mr. George Ellard replied in a capital speech, and said he had come back from a visit to America with the conviction that the work turned out in that country was a good deal better than English work, for the one reason that, although American workmen were no better than English working men, though they had the same machinery to produce the same goods, the incentive given to the men was so much better than the manufacturers gave on this side of the water, and that produced better results. If their manufacturers were only to encourage their men, if they were to bring in what was called the piece-work statement instead of paying their 4s. or 45s. a week for working from eight in the morning to half-past six at night, it would be much better. If the workman was encouraged to get through as much work as he could, to do it as well as he could, and to help the master to get as much work as he could, England would be in front of the Americans. Without that they had not a "look in" with them. Every factory he went to in America, and he went to a good many, was full of orders. When the Americans had filled their own markets they must

## CABOT'S INSULATING & DEAFENING QUILT.

### A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

### A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay proof, moth, and vermin-proof, and uninflamable.

### FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

### CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

## CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

## THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

come over this side, and then God help the British manufacturer unless he looked up and paid his workmen satisfactorily.

Councillor A. P. Hawtin proposed "The Visitors," and Councillor T. L. Wright responded.

Mr. C Archer gave "The Chairman," and the toast was very heartily drunk, musical honours being accorded.

Mr. Bird suitably returned thanks.

Councillor W. Heap proposed "The Vice-Chairman," Mr. W. Higgins replying.

Councillor F. Letts, in submitting "The health of the Secretary," referred to Mr. Airs's energetic work and his willingness to do anything to help forward the Association, and especially instanced the Insurance Association, remarking that he had left no stone unturned to make this a success.

This toast was also drunk with musical honours, and Mr. Airs, in reply, mentioned that it was the twenty-sixth time he had responded to the toast. He was glad that the membership of the Association kept up to the standard—they numbered more than when the Association was first started—and it was very pleasing to find that so many of the members who were with them at the commencement were still members of the Association. The fact that they were quiet and had no troubles showed that the Association had done a vast amount of good. The Association had also tended in a great measure to cement the good fellowship between the members of the building trade, a feeling which was evident all the year round.

The concluding toasts were "The Press" and "The Host and Hostess."

### WIRE-GLASS WINDOWS.\*

THE subject for which I shall have the honour of asking your consideration will be "Wire-glass," the fire-retardant, a building material which tends to reduce to the minimum the hazard of conflagration, and conduces to the elimination of some risks attending the lives of us humble fire-fighters. The range of possibilities in fire-protection is too wide to speak of here, if I am to be favoured with your attention, and only a small portion of it can be engaged in during this short session.

\* A paper by Edward F. Croker, chief of Fire Department, city of New York, read at the thirtieth annual convention of the International Association of Fire Engineers, New York.

I shall endeavour to advance that which I believe to be the most important factor in the protection of buildings against conflagration, and I shall be amply rewarded if I enkindle in your minds an inclination to seek more information upon the subject than I am enabled to communicate.

It is manifest to all thoughtful minds that the phenomenal development of the real estate values in our cities has made the tall building a necessity, and this necessity has brought with it the need of adopting in building construction barriers to conflagration, and there are to-day buildings capable of enduring without structural injury the action of fierce, long-continued interior and exterior flames and the application of cold water upon their heated surfaces. Structurally a building of this class is admirable—the foundations are secure, the walls and roof fireproof, but openings in walls and roof are necessary to render it habitable. Obviously the vulnerable parts of a building are the openings in the walls and roof—its doors, windows and skylights. To these openings the spread of flame is almost wholly attributable. This has been the history of so many destructive conflagrations that experts have long agreed that no structure in a closely built city can be considered even approximately secure against fire so long as it is provided with only ordinary windows, skylights and doors. My experience and observation have been such as justify this opinion, and I have most strenuously maintained that the quantity of wood contained in what I have termed "a structurally fireproof building," taking into consideration also the furniture and fittings, would, in the event of fire, endanger the property and the lives contained within it.

Shutters of iron or of metal-coloured wood may protect windows if they are carefully closed, but in practice such shutters fall short of the purpose for which they were intended. When the crisis comes the shutter is frequently found open. Under the most favourable conditions an iron shutter at a fire is not the thing that the firemen want to come in contact with. Its rusty fastenings and blistering sides are objectionable, to say the least, and its reach, when it swings open, is liable to knock a man off the ladder. This is a risk to which the fire-fighter should not be subjected. There is no braver, manlier or more faithful set of men in the public service or out of it than the brave lads enrolled in our fire departments. I know of whom I speak, and I am well acquainted with the chances they take. They are ready to fight with death every day. Every year sees them saving life heroically or dying in their duty. Their work is as trying, difficult and dangerous as

here is in the world. Yet they are not safeguarded. I know that ready fellows they are, and I feel that all known means of protection should be adopted to render their calling less hazardous.

Wire-glass is, in my opinion, the fire-stop for window and skylight openings—wire-glass set in metal frames. It supplies the requisite light and ventilation as well as protection against fire; its installation obviates the necessity of the cumbersome and unsightly hinged shutters and the projecting lugs and adjusters which support and secure them. It affords protection regardless of the janitor's neglect, because the thought of fire is not necessarily present in the mind of the tenant to induce him to close the window-sash, and when closed it prevents the ingress, egress or communication of flame. It enables the chief to size the situation and direct his men intelligently. The location and volume of the blaze are immediately discovered, and if the conditions warrant it the fireman can effect an opening for the stream with his fire-axe.

Hard conditions, great risks and the sacrifice of large property and many lives are preliminary to the establishment of standards, and by such means wire-glass has come to be recognised as standard, and the degree of honour which is its legitimate due should be generally recognised.

Succinctly stated, wire-glass has yielded two fixed values as a contribution to fireproof building construction:—

It retards fire without hiding it—permits the blaze to declare itself.

It can be cracked, but it cannot be scattered. If fractured it retains its place.

Now we have to remember what we cannot forget, and we are mindful, therefore, of experiences which enable us to fully appreciate the value first stated. Of the many embarrassments to which the fire-fighter is subject, that which prevents fire from disclosing its location in its incipient stage is the most serious. Within the congested districts of our great cities our organisations are such as enable us to reach the scene of action and have our nozzles in hand within two or three minutes of the alarm, and if we could immediately get at the fire we would, in most cases, have little difficulty in confining the blaze within the limits of the apartment in which it originated.

Modern science has equipped our departments with devices necessary to combat fire, the most contagious, virulent and disastrous of all perils to which buildings are subjected, and modern science has devised the means by which fire can be confined within the walls of buildings without rendering the

same inaccessible to us, but the adoption of the means available is not general, and upon arriving at a fire we are frequently confronted with tin-covered and iron-clad shutters which obstruct our vision and our efforts to locate and conquer a blaze which becomes a conflagration, because of the precious moments lost in concentrating our energies upon the seat of trouble.

This condition has long been a serious menace in all cities, and it is now intolerable because the installation of wire-glass presents no technical difficulties. It is of acknowledged efficiency and no less economical than effective. It has withstood the severest tests, and its cost is well within the means of all building owners. The insurance companies give preferred rates when it is installed, and thus practically invest in it. Their scheme is to reduce hazards, and in the belief that wire-glass effectually accomplishes this they induce its adoption by substantial endorsement. Its ability to abate horrors and loss which attend conflagrations in cities is ample justification of the reasonable laws providing for its adoption, and an exigent public duty is presented to building inspectors to prevent these laws being nullified by official inertia.

There is a region paved with good intentions, and many easy-going owners of buildings contribute to this paving fund by deferring the adoption of known means of protection and at the same time create occasion for regret from heavy financial loss and probable loss of life. I want to see the obligation placed upon owners of buildings to prevent such losses by the means which will effectually render fire non-communicative, and I think I have specified the means. The significance and overwhelming argument in favour of wire-glass as a fire-stop is the fact that when fractured it retains its place and continues to retard draught and its attending flames.

Doubtless many of the chiefs present have had occasion to recognise the efficiency of wire-glass as a fire-stop, and, of the many, Chief Musham's experience is especially worthy of reference. The fire which destroyed the Armour Lard Refinery, Union Stock Yards, Chicago, on the night of May 16, threatened for a time the entire district. Chief Musham was present, and he has stated that the wire-glass in the windows of the several walls prevented any communication through them and demonstrated the ability of wire-glass to prevent the spread of flame. The building destroyed was of recent construction, 100 feet by 400 feet, five storeys in height, and subdivided into four sections by fire-walls, two of which were completely destroyed.

The quantity and nature of the material in combustion—refined lard—resulted in the hottest kind of a fire, and its intensity and duration are hardly comprehensible. The chief tells me that the flames reached to a height of 150 feet above the roof, and the combustion was so perfect that scarcely any sparks were observed.

I am quoting Chief Musham because I think perhaps his observation of wire-glass in this instance was under a better condition than can be conceived for an actual service-test of wire-glass. The entire interior of the building was of inflammable construction, made more so by being saturated with lard, and its five great floors were loaded with tons of this highly combustible product. Tanks containing thousands of gallons of rendering were exploded and their contents dashed against the walls and windows, and the intensity of the heat was so great that the walls holding the frames and sash which accommodated the glass crumbled, but until they fell the wire-glass retained its place.

This fire establishes conclusive proof of the efficiency of wire-glass as a fire-retardant and its staying qualities, and for the purpose of illustrating my subject I have considered it preferable to my own experience.

### BIRMINGHAM SEWERAGE WORKS.

A QUARTERLY meeting of the Birmingham Tame and Rea District Drainage Board was held on Tuesday at the Council House. Alderman Baker presided, and there were present the Lord Mayor (Alderman J. H. Lloyd), Aldermen Dr. Barratt, Ash and Bowkett; Councillors Lancaster, Halse, Parkins and Barber; Messrs. J. J. Gittings, J. J. Hughes, J. Gosling and T. E. Bladon.

Councillor Lancaster presented the report of the finance committee, which recommended that 3,643*l* 6*s*. 1*d*. be borrowed, at 3½ per cent. interest, from the Corporation of Birmingham. He said the money was required for the purpose of spreading the repayment of the thirty-years loans over sixty years.

The recommendation was approved, and accounts were passed amounting in the aggregate to 26,954*l* 8*s*. 11*d*.

Alderman Dr. Barratt brought forward the report of the works committee, and proposed the approval of the drawings which had been prepared by the engineer for the bacteria filter-beds, for which the board had decided to apply for sanction to borrow 40,000*l*. He said it was obvious that the

increase of the population of the united district must involve some addition to the outlay. This year there were 2,400 more rated tenements to be provided for than in the previous year, but a reduction in the precepts was made. The amount of charge upon the ratepayers must be calculated on the rate per pound which the precepts involved, and when that was taken into account the reduction was more marked. It was not possible that a decrease in the total amount raised could be continued; for it was to be noted that the normal rate of increase of the population would demand the use of 1·15 acre more per week in the land required for purification. If, however, they could arrange that the rate in the pound should not be increased it must be considered satisfactory, and that—although no absolute pledge could be given—they hoped to be able to secure. The demand for land could not be indefinitely met, and, although provision was made under the Act for some future requirements, that calculation was made before the Local Government Board determined that an addition should be made to the area of the united district by the inclusion of a large part of King's Norton and Northfield. There was, therefore, a great necessity that, if possible, some means of artificial purification should be adopted. That the advance in bacteriological science, both in theory and in practice, might provide. Pending the fuller investigation of the subject, the board, having a large area of land to make use of, did not deem it wise to make expensive experiments themselves, whilst carefully watching those made in other places. There was now sufficient knowledge available to justify works of that kind, and the beds at Minworth Greaves had been sanctioned by the board, and drawings were submitted for approval.

The resolution having been seconded, the Chairman said the committee were thoroughly satisfied that the bacteria beds were required. Looking at their work from every point of view, and notwithstanding their great expenditure, it was hoped that there would not be any increased demand on the different districts next year for contributions to the general fund. The board were certainly spending a great deal of money, but by the exercise of the strictest economy they hoped it would not be necessary to increase the rate.

The resolution was carried, and it was also resolved to ask the Local Government Board for sanction to the borrowing of 40,000*l*. in respect of additional expenditure, and 10,000*l*. for the construction of tanks at Ashold and Tyburn.

The report was approved.

## THE WEEK.

REALISM does not appear to have succumbed under the severe condemnation of it by the Emperor of GERMANY nearly a year ago. His MAJESTY has, therefore, returned to the charge, and on Sunday last he delivered a similar discourse at the opening of the art colleges which have been erected in Charlottenburg. The EMPEROR said he addressed a earnest warning to both masters and pupils to guard and preserve the ideals of art in the paths indicated by tradition and by the immutable laws of beauty, harmony and aesthetics, while closely adhering to the unattainable Classic models and faithfully following the numerous great masters of all succeeding centuries who consecrated themselves to art and further developed it, and especially those masters who either taught or received their training at the Academy. The subject, as we pointed out on the first occasion, is one which bristles with difficulties. What law of art can be taken as immutable? It is impossible to attain certainty about the type of art which is best adapted for imitation. METZKE, who was a realist during the greater part of his life, suggested, in the second part of "Faust," by the union of JUST and HELEN OF TROY, that Germany and Greece should become as one. But German idealism in painting and sculpture has always retained traces of Iceland and Scandinavia. Figures of BRYNHILD, SIGURD, HAGEN, GUDRUN and other heroes and heroines of the ancient legends would be recognised if they were presented in the slim and graceful proportions of the best Greek statues. The idealism which was at one time popular is no more adapted to represent life at the present time than the life of the Vikings and Niblungs. There are grim tragedies constantly being enacted in Berlin and other German cities which would become mockeries if they were depicted in a manner that would be fraudulent evidence of the absence of error and of suffering. If artists have by nature an inclination to the refined sentimentalities which were popular one time, let them follow their bent. But to compel artists to falsify the scenes they meet with may have political advantages, but it does not conduce either to truth or to the advance of fine art.

It is a common practice for representatives of trades unions to interview or communicate with employers and to suggest the possibility of a strike arising unless there is a cessation of some practice alleged to be contrary to accepted custom, or the dismissal of some employé who has given offence by his conduct. Is it, however, according to law for builders' society to imitate that practice? That was the question which had to be answered by the Lord Chief Justice, Mr. Justice WILLS and Mr. Justice CHANNELL on Tuesday. There was a strike at St. Anne's in 1899, in which the plaintiff, a joiner, took a prominent part. Afterwards he found employment at a different place. The St. Anne's Master Builders' Association notified the Lancashire and Cheshire Society, to which the plaintiff belonged, for the purpose of obtaining his dismissal. It was a rule that no member should employ a workman who was locked out from the workshop of another member. He was accordingly discharged. A claim was made in the Blackpool County Court by the plaintiff, but the judge considered there was no evidence to support it. The plaintiff appealed. The Lord Chief Justice said that some domination between masters might be lawful, and plaintiff's employers were within their legal rights in ceasing to employ him. They anticipated trouble with the co-federated society if they retained him. There was no breach of contract and what they had done was for the protection of their own interests. The appeal was dismissed, but the case is to be carried to a higher court.

The case of READ v. Friendly Society of Operative Stonemasons and Others, which came before the Court of Appeal on Tuesday, has an important bearing on the subject of technical education. A man is supposed to be too old to learn, but if he have a wish to become a journeyman he cannot do so in England if his age exceeds sixteen years. That at least was the theory of

the Friendly Society of Stonemasons at Ipswich. There was an exception for masons' sons and stepsons. The plaintiff, who was twenty-five, agreed to serve as an apprentice for three years, receiving 15s. a week as wages. The Society objected and threatened a strike, and the man was compelled to return to labourer's work. He sued the Society for damages for maliciously inducing his masters to break their contract with him. In the County Court the judge said as no improper motive could be alleged, there was no cause of action against the Society. The plaintiff appealed. The Lord Chief Justice followed the dictum of Chief Justice ERLE, who held that "the procurement of the violation of a right is a cause of action in all cases where the violation is an actionable wrong," and there was no evidence to show that the Society, or any of its members, would suffer by the fulfilment of the contract with the plaintiff. The defendants appealed, and, as will be seen from the judgments printed in our supplement, they have not succeeded, and will have to pay 50% to the plaintiff.

THE last part of the Journal of the Sanitary Institute is devoted to the proceedings of the Congress at Manchester, which was held in September. The addresses and papers are of exceptional importance. Among the recommendations of the sections were the following:—"That in the opinion of this conference the time has arrived for the consolidation and revision of the existing Public Health Acts, and that the Local Government Board should be urged to give the subject their serious consideration with the view of bringing it as soon as conveniently possible before the notice of Parliament. That in the opinion of this conference the period for the repayment of loans under the Housing of the Working Classes Acts should be extended to 100 years for land and eighty years for buildings, and that the Local Government Board should be empowered to authorise loans at a low rate of interest. That this conference is of opinion that the time has arrived when no person should without permission of the local authority open up, alter, add to or otherwise deal with the drainage or sanitary appliances of any house, building or premises. That all drains and sanitary appliances be constructed and required to stand the hydraulic or other equally satisfactory test to be applied by the inspector of the sanitary authority before such work be covered from view or passed. That this conference is of opinion that all waste pipes ought to be trapped as close to each fitting as possible, and that the Local Government Board be requested to remodel their by-laws." The Institute, it should be noted, did not consider it desirable to take action with regard to all the resolutions.

STUDENTS of the history of art will learn with regret of the death of EUGÈNE MÜNTZ. Officially he was the conservateur of the Ecole des Beaux-Arts in Paris, and his "Guide" to those who wish to participate in the benefit of that great school has sufficient interest to make it eligible for a place on the bookshelves of amateurs. Among modern scholars he was unsurpassed for the labour he spent in researches. The Renaissance in all its amplitude was the theme which inspired him. The three noble volumes on "The Primitives," "The Age of Gold," and "The Decadence" in Italy comprise only a part of his inquiries. He was anxious to pursue the subject as presented in other lands, and one of his first projects was to treat of the Renaissance in England. From the scheme he had prepared it was evident that he was well acquainted with all the English books on the subject. Reviews of most of his works have appeared in this Journal. His life of RAPHAEL and his popular handbook on tapestry have been translated into English. The erudition of EUGÈNE MÜNTZ was no less visible in small tracts which he read before societies or prepared for a temporary purpose. He contributed much to *L'Art* and other periodicals. As a referee on difficult questions he was constantly in request. Although he had produced so much and of a kind which required evidence for every paragraph, EUGÈNE MÜNTZ was no more than sixty years old at his death. He had accumulated data for several other books, and it is no exaggeration to say that not only France, but the civilised world, is the loser by the passing away of so eminent a scholar before the work he had planned was accomplished.

PAINTERS' ARCHITECTURE: ANDREA MANTEGNA.

## PUBLIC WORKS IN IRELAND.

THERE was a time when the shortcomings of the Irish Board of Works afforded perennial subjects for ridicule on and off the stage in Ireland. As a public department it was not more inefficient than many others. But the failures were object lessons which could not be misunderstood. A road which was only partially adapted for traffic, channels which exemplified arterial drainage by flooding lands, reclamations which could only produce weeds, were supposed to be visible in all parts of the country. The failures were in most cases caused by want of money rather than by any deficiency of skill in the Board's officers. It was at one time revealed at a trial of an accountant of the Board for applying funds to his own use, that the chairman was accustomed to send bundles of blank cheques in a canal barge to the head office (there was no parcels post in those days), and was indifferent to the amounts which were afterwards inscribed on them. The House of Commons, in consequence, declined to vote large sums to be expended by an establishment which was without efficient control, and a great many undertakings came to a premature end. Estimates for public works were often prepared by the Board's officers on insufficient data. On the figures the sanction of the people who were to be considered as borrowers was obtained. The outlay exceeded the estimates, and it became a serious question how far financial obligations were incurred by owners of property to pay expenses of which they could have no knowledge when they entered into agreements with the Board. The Government acted in an equitable spirit. The grand total of the sums advanced by the agency of the Commissioners for Works of various kinds has been 44,288,120*l.*, and the amount remitted is nearly one-fifth of the total, being 8,070,947*l.* Can a parallel to so much generosity be found in any other country?

The Commissioners have now a far greater variety of subjects to control than their predecessors in the days when Colonel HARRY D. JONES, R.E., was chairman. But there is apparently a more business-like method followed. Complaints are in consequence less common. It is also remarkable that in a country where charges of dishonesty are easily created, not a word is heard about illicit commissions arising out of the numerous contracts of the Board. The utmost that can be alleged is that the Commissioners are not over-generous in advancing public money and are careful about securities. The Irish people, it should be known, cannot realise that when the State lends money the transaction is to be treated on the same footing as the loans of ordinary creditors. Local bodies will pay promptly the dividends on stock held by private persons, but it is taken for granted that instalments due to the Board of Works need not be paid until at least thirty days of grace have elapsed. This is ungracious treatment,

for the Treasury is considerate in its arrangements. One example will suffice. Last year the sum of 115,000*l.* was advanced to the Cork, Blackrock and Passage Railway to help in the completion and equipment of a line to Crohaven. Legally the loan should not have exceeded 65,000*l.*, but the case was supposed to be exceptional and collateral security was dispensed with. The usual rules for repayment were modified, with the result that during the first six years the company will have to repay only 5 per cent. of the principal instead of 14½ per cent. Other cases no less lenient could be cited.

We need not enter into all the undertakings for which the Commissioners are responsible. Fisheries, railways, arterial drainage, inland navigation, harbours, reclamations &c., are of unquestionable importance, but architects and builders rarely have a share in them. It will be more convenient to restrict our attention to subjects immediately related to buildings.

"The Castle," which is the town residence of the Lord Lieutenant as well as a collection of the principal offices of the Government, is generally dull in appearance, but is transformed during the "season." Then, as if it were a theatre, the properties are taken out of the stores and arranged to give effect. A covered bridge of concrete and iron has been constructed in order to facilitate the supply and removal of the furniture required for the State apartments. At the Viceroy's house in Phoenix Park a water-supply has been provided in order to cope with fires. Phoenix Park is available for games of cricket, football and hurling. In some restriction is demanded to prevent damage to the turf by grooms and trainers of racehorses. Restraint is also imposed by motorists and cyclists, who there adopt the notion of liberty, which is power to annoy other people with impunity.

We have more than once referred to the Italian ceiling in the Royal Hospital, Kilmainham, which was the most elaborate example of that class of work in Ireland. It became unsafe owing to the key of the stucco plaster having failed through disintegration and the enormous weight of the ceiling. Three courses were proposed, viz.: (1) repairing the existing ceiling; (2) erecting a new ceiling on similar lines and of improved architectural character as proposed by Sir THOMAS DRUMMOND; (3) erecting a reproduction of the existing ceiling. The Treasury directed the following of the third course. A contract has been made with Messrs. JACKSON, and all the parts required have been sent to London to serve for a reproduction. A part will be reserved for the Technical Museum in Dublin. The remainder has been demolished. It is hoped that a small portion may be introduced into a reproduction.

Public education in Ireland is conducted on a different monetary system to that proposed for England. Although it was supposed the country was provided with buildings

The average expenditure has to be about 30,000*l.* a year. Between 1882 and 1902 the outlay was 624,088*l.* Standard plans have been prepared, and there are also standard prices for estimating, of which it is said that "as a scale is applicable to the whole of Ireland, it obviously cannot be strictly accurate for all places, but though it may be slightly too favourable in some cases and too unfavourable in others, the estimates are believed on the whole to be equitable to those who have to build the schools."

One important part of the Board's authority relates to the protection of ancient monuments. In the last report there is much to suggest how persistent are the efforts to remove ivy from the ruins. Opinions differ as to whether the creeper is really a danger. It has been supposed that, as the song says, "the walls must be crumbled, the stone decayed to pleasure its dainty whim." On the other hand, antiquarians have declared that ivy draws moisture from walls, and is therefore a preservative against damp, with all the evils that follow. The theory held by the Board of Works is that ivy is injurious, and it is therefore removed. The ancient masonry which is revealed is not always picturesque, and archaeologists respect truth, and it must be owned that ivy often served to conceal evidence against fallacious theories. The Abbey of Ennis, the Church of Drumlane, the Abbey of Ross-Errilly, St. Cronin's Church, the buildings at Glendalough, Holy Cross Abbey, Monasterboice, Sligo Abbey, Lusk Round Tower, Ardmore Cathedral, are among the remains which were cleared from ivy. In one place there was such a mass of vegetation it was necessary to cut the ivy at the roots and to wait until the branches had withered for their removal. Tourists who seek immortality by cutting their names on stones will, no doubt, be grieved when they learn that the Board is so pre-empting as well as of ivy. The expenditure on national monuments cannot be considered as extravagant. The outlay varies from 3*s.* 6*d.* at Clonkeen to 52*l.* 1*s.* at Dromcliff, the total being no more than 332*l.* 4*s.* 9*d.* during the past year. The salary and travelling expenses of the principal surveyor, caretakers' wages, &c., in addition came to 59*l.* 1*s.*, or in all 591*l.* 5*s.* 9*d.* We give elsewhere the report on Canon's Island Abbey, co. Clare, which will suggest that archaeological investigation is not neglected in the details.

Among the works on which expenditure is authorised are more urgent than the erection of labourers' dwellings in towns as well as in country districts. During the past year nineteen applications were sent in for loans to erect buildings in towns, and thirteen were approved. The amount to be expended is 19,720*l.* Three of the loans amounting to 1,389*l.* were for private individuals. The money may appear like a drop of water in a lake, but since 1868 no less than 977,313*l.*, or nearly a million, has been obtained for the benefit of the working classes in towns. In the country there is, if possible, a stronger necessity for the removal of hovels. Last year the advances were 157,810*l.*, and the total amount sanctioned since 1883 has been 2,428,402*l.*

Only one application was received for a loan under the Public Libraries Acts. It was favourably considered, but there was no necessity to obtain money in that way, for the work was carried out by local effort. In Ireland, as in England, lunacy is increasing, and no less than twenty-eight applications for money to build asylums were received. In the last year seven loans were given to the extent of 113,095*l.* Loans for workhouse buildings were 49,467*l.* Those under the Public Health Acts during the year amounted to 57,82*l.*, making a total of 3,339,192*l.* for waterworks, sewage, paving, public lighting, &c. During the last year the arm buildings completed by loans from the Board authorised by the Lands Improvement Act cost 42,884*l.*, and the arm buildings commenced represented loans of 28,645*l.* The figures given are indications of efforts to improve the material. In the last year the National Debt Commissioners enabled the Board of Works to lend 55,69*l.* So large a sum could not be expended under financial control without many benefits arising to the country. There is little doubt that still larger sums could be obtained if satisfactory projects were devised, but under the peculiar circumstances which prevail in Ireland there is as yet only a limited desire to accept aid which involves the regular payment of sums to meet principal and interest.

## MORRIS ON ARCHITECTURE, INDUSTRY AND WEALTH.\*

IN his political exercises the late WILLIAM MORRIS was not unlike CANNING's "Friend of Humanity." His views were expansive if vague. He might talk or write about "comrades" and believed he was stoutly aiding the "common weal," but the men he addressed knew they were little more than abstractions for him. Occasionally he made spasmodic efforts to appear as the ordinary street rioter. He was not able, however, to convince the stupidest policeman that he was a danger to the public security. Considered as an artist we find no trace of the nebulous vastness of the amateur socialist's views. It was evident he did not consider he was competent to discharge the multifarious duties of an architect, and preferred to become an auxiliary. At first MORRIS and his friends, when they turned shopkeepers, were willing to supply furniture, stained glass, metalwork; but after a time his inclinations became more definite, and it might be said that he restricted his own participation to the production of textiles of various kinds and wall-papers. As became a craftsman, he recognised, if he did not always obey, the necessity of concentration.

In the addresses he delivered throughout the country we see this power of limitation asserting itself. As a rule lecturers to popular audiences generally select subjects so comprehensive as to be outside the criticism of specialists. The history of architecture in all countries would be on such occasions as easily exhausted in an hour as the "Bible and Geology," the "Philosophy of Evolution," the "Principles of English Law," or subjects no less important. But MORRIS, instead of attempting to unfold the whole history of architecture to the friends of the Society for the Protection of Ancient Buildings, was content "to call attention to certain things he had noticed in studying the development of the art of pattern-designing from ancient times to modern," and the audience must have been wanting in appreciation if they did not realise how much was gained by the exchange. In another lecture which had the same object, architecture is suggested by arts which were associated with it, such as pottery, glass-making, weaving, dyeing, printing patterns, furniture and dress.

The volume of lectures and papers having for title "Architecture, Industry and Wealth," of which a new edition has appeared this week, will enable the reader to enjoy WILLIAM MORRIS at his best, even if he has to regret some divagations. The "History of Pattern Designing," the "Lesser Arts of Life," "Textile Fabrics," the "Revival of Architecture," the "Revival of Handicraft," "Art and Industry in the Fourteenth Century," the "Influence of Building Materials on Architecture," and the "External Covering of Roofs" are all revelations of the trained observer and the genuine workman who was on the lookout for information that could be turned to profitable use. In "Art, Wealth and Riches," "Art and Socialism" and "Art under Plutocracy" we have the spectator who had no fear about his competency to undertake an obligation like the one before which HAMLET quailed, and to set right a time which is out of joint.

In treating the second class of subjects MORRIS, although so much of a man of business, was not able to resist a common fallacy. He saw in museums, private collections and auction-rooms objects which were originally intended for everyday use, and for which amateurs now willingly give large sums. He concluded that in the days when they were produced all things were no less beautiful. An extract from "Art under Plutocracy" will serve to suggest his reasoning:—

In the times when art was abundant and healthy all men were more or less artists, that is to say, the instinct for beauty which is inborn in every complete man had such force that the whole body of craftsmen habitually and without conscious effort made beautiful things, and the audience for the authors of intellectual art was nothing short of the whole people. And so they had each an assured hope of gaining that genuine praise and sympathy which all men who exercise their imagination in expression most certainly and naturally crave,

\* *Architecture, Industry and Wealth.* Collected Papers by William Morris. (London, New York and Bombay: Longmans, Green & Co.)

and the lack of which does certainly injure them in some way, makes them shy, over-sensitive and narrow, or else cynical and mocking, and in that case well-nigh useless.

It will be observed that in this passage, which is only one among many inspired with the same spirit, not a word is said about time or place. No research will discover for us a period or a country when all men were more or less healthy artists. The statement would be more effective if it commenced "In the Atlantis" or "In the Country of Nowhere" or other Utopian region, for then we need not attempt to apply the historical test to so beautiful a vision. MORRIS when he spoke about the past was displaying his imaginative strength, and it is difficult to resist the conclusion that he was still imagining when he went on to assert that "in these days the whole people is careless and ignorant of art," or foretold the supremacy of Socialism hereafter. If ignorance still prevails, then his own employment at South Kensington, his own productions as a manufacturer, his own speeches and writings were of little advantage, and he was almost bound on principle to retire from his position. Why continue to keep up an illusion if no benefit to the public arose from his efforts? The fact was he could not be an impartial critic about the products of our time. His own theories of healthy art were exemplified in the wares of MORRIS & Co., and it would be demanding more heroism than is to be expected in trade if he were not supercilious to the productions of other firms who sometimes were his rivals.

That MORRIS & Co attained success as measured by profit in money could not be questioned. It was evidence that the age was not insensible to what was believed to be art in the fullest sense of the word. Other firms might also thrive if they were able to surround themselves with a like glamour. MORRIS's success was not perhaps of the kind he desired. With all his imagination, he was not able to refer to patrons who, by surrounding themselves with Morrisonian products, had attained that enviable state of mind which was said to be the characteristic of the men and women of the fortunate ages when art flourished, and they came under "the humanising influence which the daily sight of beautiful handiwork brings to bear upon people." All history that is authentic is against that belief. In Athens, Rome, Florence, Nuremberg, wickedness prevailed in palaces and public places which no work of art could repress. Art is good and useful, but it is not an universal remedy for the ills that the mind is heir to, and all MORRIS's assumptions are, therefore, based on fallacies or fancies to which his poetic mind gave importance. The addresses are, however, revelations of one aspect of his character.

A rough division may be made of his addresses, and we can say he was far more successful in their composition when he treated of inanimate objects, rather than when he discussed the acts of living beings. Take, for example, the following passage relating to roofs, which suggests that his observing eye was always at work, and that its records were faithful:—

In the Middle Ages (or indeed down to the end of the eighteenth century) all roof coverings were more or less good. Lead (properly cast and of a due thickness), oak shingles, well-made red tiles, which weathered beautifully, straw, or reed thatch, stone slates or slabs, or at the worst slates smaller, thicker and less mechanically dressed than those now in use, made it almost impossible for a roof to be really ugly, and more often insured its being actually beautiful. The older parts of Edinburgh, for instance, owe much of their good looks to the houses being roofed with small, thick, dark coloured slates, and wherever we come across one of the old houses where these have been supplanted by modern thin slates, an obvious disastrous hole in the line of houses is the result. Again, how much of the charm of the pattern old English villages is (one must say almost was, so fast are they disappearing) due to their thatched roofs, which look always the better the neater and trimmer they are kept. The same thing may be said of numberless little buildings in the various districts of England, such as Yorkshire, Derbyshire, Northamptonshire, Gloucestershire and the western parts of Oxfordshire and Berkshire, in which stone slabs or beautiful stone slates were universally used till about sixty years ago; many of these farmhouses, cottages and barns, &c., being quite destitute of any ornament, but unfailingly beautiful because of the material of their roofs.

In many other pages we discover no less pleasing reminiscences. MORRIS believed with TENNYSON that "knowledge

is but what we see," and we find enough evidence of his patient research after ancient examples which he considered would be useful to him as an artist and a manufacturer. The paper on the "History of Pattern Design" is really what the title indicates, and a volume could be made out of the information it contains. This fulness of material is seen in several of the papers, although the descriptions may suffer by the introduction of passages which relate to his projects of reform. WILLIAM MORRIS, too, as became a modern poet, was given to pessimism. He will describe the fine works of past ages, and then will conclude by saying there is no use in thinking about them, for they were adapted to a different state of society. He winds up his lecture on textile fabrics by saying that, although he was a maker of would-be pretty things, he advised his hearers to have few of them. The finish of his lecture on the revival of architecture announces that the few examples which he considered deserving of admiration were "mere eccentricities with which the public in general has no part or lot," and that we should be satisfied to wait "for what must be the work, not of the leisure and taste of a few scholars and authors and artists, but of the necessities and aspirations of the workmen throughout the civilised world."

There are readers who can enjoy the socialistic speculations of WILLIAM MORRIS equally with his explanations of the art of past ages. But for those who believe they have no mission to direct the world and compel it to revolve in a different sort of groove, there is much which will be found delightful reading. His verse is more characteristic of the man than his prose; but without being "finical and nice in the use of words," to use an old critical expression the prose is as excellent Saxon as has been produced since the days of COBBETT, who also wasted literary skill on schemes of reform.

## MODERN BOILER-HOUSE PLANT.

By F. J. WARDEN-STEVENS, A.M.I.M.E., A.M.I.E.E.

THE question of steam-raising plant is of considerable concern to architects in connection with new buildings such as hotels, institutions, offices and residential flats, and it is the writer's intention to bring forward the importance of this matter. The boiler, &c., plant found in such buildings is frequently far from desirable, but it is to be hoped that most architects realise the importance of expert engineering advice with an engineering matter such as this.

In designing boiler-house plant it must be clearly remembered that the first cost is not the only consideration. The engineering arrangements should be such that the working and maintenance expenses, together with the interest and the depreciation charges on the capital invested are a minimum; capital outlay may be curtailed at the expense of efficiency, or, on the other hand, the capital charges may more than counterbalance the saving due to the efficiency of the plant, so it will be easily understood that each case must be carefully considered as to the conditions of working, and no standard can be adopted applicable to every case. It has been ably brought forward by the American Institution of Architects (the paper relating to the matter having been referred to in this journal) that it is necessary for engineers to be employed in connection with the engineering work of large buildings. I therefore now propose to deal with the different steam generating and using plant applicable to a building such as before mentioned, and it will be my aim to indicate the considerations which require careful reflection by an expert in order that a proper decision may be arrived at.

In most large buildings the following plant is generally required:—Boilers, heaters (for hot water and heating), pumps (for boiler-feed water, fire purposes, &c.), pipework and in some cases engines.

Now it is not generally the best practice to adopt any one particular type of boiler, heater or pump, because it may have been used in other and perhaps quite different cases. In almost every instance circumstances vary—for example, the hardness of the water available, the conditions of demand for steam, the class of coal best obtainable, the degree of smokelessness necessary (in connection with the chimney) and the space available for plant.

Even the particular sizes of plant required have been decided on occasions by a mere question of guesswork when

an intimate knowledge of the subject has not been available. The positions adopted for the placing of the plant sometimes show very plainly that the matter has not been looked upon as an important detail, and probably only thought of seriously when other matters were settled. In consequence the boiler-house is frequently found in some corner better suited for a coal cellar or other such purpose. It is to be regretted that generally the importance of the boiler-house plant is not fully realised by the owners until the buildings are inhabited. This is, plainly speaking, the difference between the position of the architect and the consulting engineer. The former has in his legitimate work little or nothing to do with financial considerations; he does not generally have to make a hotel or office-building undertaking a financial success. It may be allowed that usually he has to consider how he can incur a certain expenditure in providing a building for a certain purpose to the best advantage. It is not his concern to any extent what the cost of the upkeep will be: his only maintenance expenses are mere depreciation, and in consequence he is not accustomed to economical working of pumps, boilers or lifts.

I have recently had to advise on the pumping for water-supply and working lifts, and also on the hot water and heating in a very large block of residential buildings with a view to more satisfactory and economical working, as the expenditure for this was over 1,500*l.* per annum.

The position to be occupied by a boiler and pumping plant deserves more than passing consideration, and it is to be hoped that architects will consider this point. There should be ease of access and egress for plant. Often I have found that the walls of the boiler-house have been built or rebuilt after the plant has been fixed, thus rendering it necessary to demolish brickwork to remove a boiler. The coaling arrangements should be one of the first considerations; in some cases which have come under my notice it would have been easy to arrange for the coal to be conveyed direct from the street into the bunkers if a reasonable position had been assigned to the boiler-house, but frequently it is necessary to carry the coal down corridors to the bunkers. Further, there should be ease of extension; arrangements are frequently such that any extension becomes a matter of great difficulty and expense, and it should not be overlooked that extension must be necessary in these days of increasing use of power for all purposes in a building intended to last even, say, fifty to one hundred years.

Coming now to the actual details of plant it is impossible to lay down rules on this subject, but a little may be said on the respective merits of various types.

**Boilers.**—There are numerous types of boilers—Cornish, Lancashire, marine, dryback marine, locomotive and vertical amongst the fire-tube class, and the water-tube class also comprises several types of vertical and horizontal boilers. Usually the water-tube type of boiler is not very suited to the conditions existing in public or large buildings, except there is an irregular demand. Of the fire-tube class the various types are referred to in the order in which they should be considered. The Cornish and Lancashire boilers are suitable for steady 24 hours' use, and where space permits they are generally advisable; but as to which is adopted depends upon the output necessary. They are not greatly damaged by hard water, or, more correctly, they are easily cleaned. The great disadvantage is that these boilers must be shut down for two or three consecutive days for cleaning, and therefore must be in duplicate where steam is required continuously. A point most frequently overlooked is that a feed-water heater or economiser in the main flue should be used with these boilers to insure economy. The various marine types are suitable generally for the class of work under discussion, but an ordinary marine boiler is usually of too large a diameter for use where there is little headroom, and in these cases the dryback marine type is available. The feed-water must be soft, and if this is not the case naturally a water softener should be provided, which are of various types and need special consideration. These boilers can be fixed quickly, especially the dryback; no settings are required, they occupy little space and give good results, but require care in use. They cannot be trusted if they are to have the usual and unskilled attention frequently given to plant in such cases. Locomotive type boilers are not usually

advisable for the work required in large buildings; it is an excellent type for a locomotive or traction engine as it is a quick steam raiser and occupies little space. It is, however, difficult to clean, not very efficient and produces a considerable amount of smoke. Its low first cost is attractive, but this usual temptation should be resisted, except in cases where required only occasionally or irregularly in use. The various forms of vertical boiler cannot here be discussed in detail; suffice it to say that they vary considerably, and they are not always to be judged by price. A vertical boiler should, however, be used in preference to a locomotive type for heating work.

**Pumps.**—Feed-water pumps and pumps for lifts, increasing water-pressure, &c., offer a very wide field of choice. The hours of use per annum, together with considerations of reliability, determine for the engineer the type of pump suitable. The duplex direct-acting pump is trustworthy and inexpensive, and for occasional work or as a reserve it is suitable; the steam consumption is, however, excessive. Injectors, if of the very best type, form inexpensive and convenient reserves for boiler-feed water supply. For general use there are several good types of compound direct-acting pumps available, which are both reliable and economical, although more expensive. They are also capable of accurate regulation in some cases, so that they will meet the demand for boiler feed. The ordinary "donkey" pump may be said now to be quite out of favour, as it is chiefly noted for its noise and leakage. The use of centrifugal pumps for low lifts is developing; the improvements that have been made in their construction have increased their efficiency and made them available for lifts of even 200 feet; also they are chiefly beneficial in connection with direct-coupled high-speed engines or steam turbines, and in many cases electric motors. The usual practice of adopting a duplex direct-acting pump for purposes in case of fire cannot be objected to, as they are not required for continuous use, so efficiency is of less importance, providing the boiler power is sufficiently large. There are several arrangements of pumps which can be left always under steam and which keep the pressure up independently of the demand. Should a hydrant be turned on, the pump is at work at once and supplies the requisite quantity of water.

**Engines.**—The best engine is the least expensive, and again, every case requires particular consideration. At present there seems to be a feeling amongst some that any engine will suffice, and that there is little difference what type or make is adopted. The ordinary simple throttle governed engine is often inefficient, yet it is adopted frequently in all sizes for large buildings. It also uses large quantities of oil and takes up much space. The marine type compound engine running at a medium speed is often more economical and better for any kind of general work. The high-speed enclosed engine is useful and should be used when direct coupled to high-speed plant such as dynamos or centrifugal pumps, fans, &c. The steam turbine merits special consideration with such plant by reason of its reliability, high speed and consequent small space, steadiness in running, requiring no foundations and giving rise to no vibration, and, more important still, the cleanliness of its exhaust steam—there being no oil in the steam it can be actually mixed with water for hot-water supply.

**Heaters.**—Almost every large building now erected has a heating plant, if only for corridors, &c., also a general hot-water supply. With a small plant, a vertical boiler working at, say, 30 lbs. pressure, if the building is 60 feet high, will supply steam if required to a kitchen, a steam system of heating for both hot-water supply and for warming, and if necessary it will supply a fire-pump—it will cost less for coal and be less trouble than a circulating boiler. A good horizontal boiler is preferable except in very small sizes, as the economy is better and cleaning is easier. If there is any considerable amount of power required the question of employing exhaust steam to supply the greater part of the heat must be remembered. Heaters are of two types—the mixture and the tube. The former are more economical, as all the heat from the steam is used and scale does not reduce the economy. Where water is required for general purposes these heaters must only be used with exhaust steam containing no oil. Exhaust steam

from pumps or ordinary engines will contain too much oil, and only the exhaust steam of steam turbines can be satisfactorily used in such cases. Of the various tube heaters, one may be better than another in mechanical details, in connection with easy access for removal of scale and in the proper disposition of the heating surface.

*Pipework.*—This most important part of steam and water arrangements in every building generally receives less consideration than it should. The principal pipe runs should be settled before the building is erected, and proper channels left for the same during the construction of the building. This will avoid much cutting away and often will make all the difference in the success or failure of the pipe system. The many buildings where the heating system is a failure should surely bring forward to the architect the importance of the pipework. There can, again, be no standard rule; each case must be treated on its own merits. The question of sizes of pipes, the use of cast or wrought-iron, provision for expansion, the system of jointing, the actual course of the pipes and other points, all matters of discretion and experience, render the expense and success dependent upon the engineer who designs the work.

#### FRANCESCO BARTOLOZZI, R.A.

**A**N extract from the *Times* of November 4, 1802, relates to the departure of Bartolozzi, the engraver, from England. He was over-generous in disposing of his money, and in 1802 he was glad to accept the appointment of superintendent of the Lisbon Academy. King George III. then offered Bartolozzi a pension, but it was too late, for he had left on November 3. The *Times* said:—

This celebrated engraver left our metropolis yesterday morning in order to proceed to Portugal. It is much to be regretted that an artist of such eminence, and whose talents have so long done honour to this country, should have been compelled in the decline of his life to have sought an asylum in any other—yet we have nothing with which to reproach ourselves on his account; the efforts of his genius have been rewarded with the liberality which uniformly distinguishes the English nation, and if imprudence has lavished what generosity has bestowed, it is a subject of regret that splendid talents should be unaccompanied by common prudence. The fact is, Mr. Bartolozzi has suffered himself to be too much imposed upon by his own countrymen, who have taken advantage of his easiness of temper and his carelessness with regard to his affairs. Thus, although he has acquired what might have been an independent fortune, he has neglected to preserve it; and to secure tranquillity and comfort to his latter days he has accepted the offer of the Government of Portugal, and has consented to pass the remainder of his days there, upon what in this country would be deemed a very moderate pension. We understand that a national academy of arts is to be established at Lisbon, of which Mr. Bartolozzi is to have the superintendence. He is to be attended by two pupils from this country. A handsome suite of apartments are to be assigned him, and everything else provided for him at Lisbon, independent of his salary, which is little more than 200*l.* sterling a year. He purposes before his final departure to pass a few days at Bath. We cannot avoid observing that if the state of Mr. Bartolozzi's fortune is such as to require the aid of a patronising Government, it would be a gratification to every Englishman that he should have been indebted for that assistance solely to the country of which he has so many years been the ornament.

If, however, his departure is a matter of choice, we sincerely wish he may meet with encouragement equal to what he has experienced from the British nation.

Bartolozzi remained in Lisbon until his death in 1815.

#### RELATIVE PERMANENCE OF STEEL AND MASONRY CONSTRUCTION.

(Continued from last week.)

**E**UGENE W. STERN, M.Am.Soc.C.E.—Discussing this question from the standpoint of the protection of iron and steel construction in buildings, the experience of the speaker is that iron does rust in buildings. That is, it rusts unless properly protected. Therefore it is a very important question to determine what kind of protection it needs to prevent this under different conditions of exposure.

In the interior of buildings, where there is no chance o

moisture or acids attacking the iron, and where it is usually surrounded by fireproofing materials, the danger from rust is very slight. The usual coat of paint appears to give all the protection necessary.

The speaker has seen ironwork taken from the interior of buildings, in one case after thirty years, in which the shop-marks of white paint and the brown coat of red-oxide paint were in as perfect condition as if done but recently.

In the exterior walls of a building, however, and in the roof and cellar construction, it is an entirely different matter. A driving rain will go through the outer coating of brickwork; roofs will somehow or other leak, and cellars rarely are absolutely dry. The speaker has invariably seen evidences of rust on the ironwork taken from the above-mentioned positions in comparatively recent buildings. The paint seemed to have disappeared entirely in many cases where exterior brickwork was laid up against the iron. Where the mortar was in immediate contact with the iron there was no rust; where the brick was directly in contact there was considerable rust.

In a building in New York city, built in 1869, and now being taken down, cast-iron girders supporting the brick arches of the side-walk construction were rusted about  $\frac{1}{8}$  inch where the brick was immediately in contact with the iron, but where the mortar was directly in contact the iron was perfectly clean and black, looking as if taken from the sand only yesterday. The evidence that paint protects ironwork thus exposed for any length of time is not forthcoming. The paint seems to disappear entirely in a few years. Nor in the speaker's opinion does it help matters to prepare the surface of the ironwork prior to painting, in the most painstaking and thorough manner, even using the sand-blast to remove the mill scale. Some of the paint is rubbed off the ironwork during erection, notwithstanding that the very greatest care is used. It is an inseparable condition, from the nature of the work, that this happens. There is then a starting-point for rust, and this will follow more quickly on a sand-blasted surface than on one having its mill scale.

The speaker is strongly opposed to the use of the sand-blast on ironwork for buildings. It does not help to protect iron permanently, and the expense therefore is not justified. For this reason the following method of protection is recommended:—All the columns and girders in the exterior walls, the roof, the cellar and wherever exposed to moisture or acids, should be surrounded with Portland cement mortar, and the bore of the columns in such locations should also be filled solid with this mortar.

Broken stone in the mixture is not recommended, because the voids may not always be filled, and cinders are strongly objected to because there is good evidence to show their very harmful effect.

A building having its frame thus protected should remain structurally sound, judging from evidence, for many years, perhaps longer than one made entirely of masonry, unless of the best quality.

George F. Swain, M.Am.Soc.C.E.—People in general have come to consider iron or steel as rather perishable materials when compared with stone. Many persons form this idea by considering the old stone structures of the Greeks and Romans, notwithstanding the fact, referred to by one speaker, that there are a great many stone structures which have proved very perishable. Many instances can be cited of bridge-abutments built of sandstone or limestone which have practically gone to pieces within thirty or forty years. In judging of the ancient stone structures of Greece or Rome, we must also remember the difference in climate between those countries and Northern New England. It may not be out of place to point out also some differences between the ways in which steel and stone structures act. A stone structure is a comparatively simple one; it acts by its own weight, it acts generally in simple compression; its durability is a question of stability rather than of strength, and the loads may generally be increased greatly without endangering it.

A steel structure is very different. It is a complex structure, involving complicated stresses and strains; its strength is a controlling factor in its durability, and any increase of load reduces correspondingly its margin of safety. Engineers who have had much to do with questions of renewing bridges will agree with the speaker that cases in which bridges have had to be renewed on account of the actual wearing out of the material are comparatively rare. Of course, there are cases where corrosion is active, especially in bridges over railroads, but, leaving out such cases, the greater number of renewals which have taken place are due to other causes. One of these is defective design. Engineers are learning more and more every day in regard to the details of steel structures, and they are experimenting and studying the various connections and details. The result is that we find that structures built twenty or thirty years ago, and supposed to have an ample factor of safety, really had a much smaller factor. Moreover, as everyone knows, the loads to which steel structures are exposed have increased enor

mously. These are the two elements which have caused the principal renewals of bridge structures. These elements will continue to be present, and as long as they are present we cannot hope to have steel structures in general as durable as the best stone structures would be. In the case of a steel-frame building the loads, presumably, are not to change very much, and with good design the actual durability of the material should govern the life of the structure. As to what that durability will be seems very uncertain. All the engineer can do is to take every precaution he can to insure the permanency of this steel. The speaker agrees with Mr. Stern that the steel should be completely enclosed in concrete, but even under these conditions he does not think the steel will last as long as the best masonry.

Charles C. Wentworth, M.Am.Soc.C.E.—The answer so far given to this question is that steel when embedded in concrete to a sufficient depth is permanent. A structure in which the steel is thus hidden becomes at times essentially as one built of concrete as of steel, and may be even more so. The fact that in most cases it is impracticable to adopt a composite construction rather than one all steel or all concrete, renders it still necessary to seek a more complete answer to the question, especially if it be considered, as it must be, that bridges are made of "building material."

The answer given, for instance, is inapplicable to the East River bridges built or building in New York city, and to the greater part, by weight, of ordinary railway bridges. It is surely inapplicable to more structural steelwork, by weight, than it is applicable to all kinds.

The protection afforded by concrete is afforded by paint, but in a less degree. The objection to paint as an answer to the question lies in the fact that much structural work is inaccessible after erection, and that in all likelihood paint will not be applied properly or with sufficient frequency even where the work can be reached by the painter.

A more complete answer to the question appears to lie in the electro-plating of structural steel with copper or aluminium. This has already been done to a small extent, but the subject does not appear to have received the attention it deserves.

The speaker sees no reason why such plating need be of excessive cost. Aluminium is an exceedingly abundant element, and is becoming cheaper; copper may retain its value. Metallic aluminium may not be needed in the process, but such aluminium salt as will serve when in solution as the source of the metallic aluminium finally composing the plating.

Of course it would be impracticable to plate steel as it comes from the rolls, as rivet-heads and sheared edges would need subsequent plating, but each structural piece ready for shipment and erection in the structure could be plated, and the details of field connections arranged with a view to their permanency on the same lines.

The speaker does not wish to appear as objecting to the use of concrete structures stiffened by steel with the incidental protection afforded to the steel by the concrete. Such structures are entirely proper and appropriate in very many cases; but in conclusion he wishes to say that the plating of structural steel, as a more general answer to the question, is well worthy of the attention of the members of this Society.

Oberlin Smith, M.Am.Soc.C.E.—The speaker is not experienced in putting up big steel buildings, but it seems to him that a certain precaution should be taken, which, perhaps, usually is not and which will be mentioned later. Some of these buildings have been up a good many years and seem to be very strong, but after this generation is gone—fifty or one hundred years hence—if there is no way to examine all that hidden metal inside the masonry, how are people going to feel about the stability of such buildings? When will the time arrive for them to come down of themselves? There should be therefore some systematic method of examination.

Of course, after many years, the owners may tear out some of the masonry and examine the steel, but it would be a small matter now to provide inspection holes, properly covered, and to differentiate and classify the various conditions of possible deterioration to which the metal may be subjected.

Certain parts of the building which are most likely to rust, and where such rusting is most likely to cause accidents and damage, would be in one class, while other parts which are not so likely to be affected would be in another, and so forth. In every building, in several proper locations, let there be certain places left where the metal can very easily be exposed and again covered up—of course in a fireproof manner. This would be done instead of merely tearing away a building at random, with perhaps considerable damage and with consequent expensive repairs.

To find out how the steel is really getting along, there should be certain times for observation, with definite intervals between. These intervals might be five, or ten, or twenty-five years—as experience should dictate. The most risky "classes" should be examined the oftenest. In general there should be certain definite methods of inspection, and definite places for

inspection, and definite times for inspection of this buried and perhaps much-suffering metal, not only that such may be done with less damage to the building, but that it may be done thoughtfully and systematically, instead of waiting for some Chicago post-office to become obsolete that we may see whether it continued safe until the end. If not done in such a manner all may be neglected, and intervals which are uncertain may become of infinite length.

William R. Webster, M.Am.Soc.C.E.—The examination of many old bridges and other structures has shown that the whitelead marking-letters of the mill are intact, and that the metal is better protected at these places than at others. That is, the plates and shapes are generally marked while hot, and before the material has had a chance to rust; but the full importance of applying the protective coating while the metal is hot has not been appreciated.

The ordinary oiling at the mills has not been satisfactory, as the material is generally made sticky and difficult to handle in the shops. In relation to this, attention is called to a railroad spike dipped in oil while slightly heated (in accordance with the specifications for an export order). Under this treatment the oil quickly dried and formed a good hard protective coating. This process might be applied to ordinary structural shapes and plates with great advantage; the material being cleaned with brushes and an air blast, and the oil applied while the material is still hot, the coating in no case being heavy enough to interfere with a thorough inspection for surface defects. The shop painting, of course, should be applied in the usual manner.

James Owen, M.Am.Soc.C.E.—It might be interesting to know that, in endeavouring to find some records of the strength of concrete beams, the speaker found in the library of the Society the report of some experiments made by Mr. Kirkaldy in 1854. Mr. Kirkaldy at that time had made an elaborate investigation of the strength of the admixture of concrete with iron rods and iron wire. Results showed at that time that the strength of the combination of the two materials, iron and concrete, was increased by more than two and one-half times that of the simple concrete itself. This is quite in accord with the present experiments in that line, and it is interesting to note that while these investigations were made so many years ago, it is only of late that the profession has appreciated their importance.

The speaker had a peculiar experience in relation to the strength of an ordinary bridge built with iron beams and brick arches and covered with concrete. The span was 15 feet. The bridge had been built some eight or ten years when the local engineer decided to change the grade of the street, and raised it about 6 feet. This alteration imposed on the bridge itself an extra load of 900 lbs. per square foot. That, with a previous allowance of 200 lbs., made a total of 11,000 lbs. The bridge was originally designed for a live and dead load of 300 lbs. and a factor of safety of four. A critical examination of the bridge, after the extra load had been on about six months, showed no rupture of any kind and no apparent deflection. The bridge is still in use.

It may be presumed, therefore, that the combined use of steel and concrete is susceptible of a great deal of further development, and that its ultimate strength is apparently unknown.

E. T. D. Myers, jun., M.Am.Soc.C.E.—During the summer of 1901 a rifle-barrel was pumped up through the 20-inch pipe connected with the centrifugal pump which was used in dredging out the historic dock immediately in front of Libby Prison. It arrived at the usual joint, just in front of the pump, which was intended to stop obstructions too large to pass through the pump. The pump was stopped and the rifle-barrel taken out. It was found that the blue enamel on the barrel was intact on at least 90 per cent. of its surface, and the sight could be raised and lowered without the slightest difficulty. The date on the barrel was 1856. It was probably thrown in the water in 1865.

The water there is fresh and is entirely free from lime. It is what is known as a "kind" water for boilers. The speaker does not know whether metal would last that way in other waters, but he has pumped up and dug up shells and rifles which were not rusted.

The depth of water in the dock was originally 16 feet, and the depth of the silt was about 4 feet. The pump was working at a depth of 22 feet. It is impossible to state the depth at which the rifle lay, but it probably came from the 16-foot level. The bottom is composed of sand and gravel, and the silt lying upon it came from the James River, which runs through a red-clay country. The rifle-barrel therefore had about 16 feet of mud and fresh water above it.

The speaker does not feel competent to discuss this topic, but he is deeply interested in it, and hopes that the result of the discussion will be the addition of much valuable information.

(To be concluded.)

## NOTES AND COMMENTS.

THE construction of Vauxhall Bridge, as originally proposed, would have been an interesting experiment. It was intended to have the visible parts of granite with a filling-in or hearting of concrete. There has been a change of engineers, and the present holder of the office has demurred to the carrying-out of openings of 70 feet wide with a clear headway of 18 feet and 15 feet, according to the position. To make any alterations in the superstructure would be to depart from the clauses of the Vauxhall Bridge Act. A report was prepared accordingly by the bridges committee on different methods of dealing with the difficulty. The following recommendations represent the conclusions:—“(a) That the resolution of the Council of February 22, 1898, directing that the new Vauxhall bridge be a granite bridge backed with concrete be rescinded. (b) That the estimate of 170,000*l.* submitted by the finance committee for the building of the superstructure of the new Vauxhall bridge be approved, and that an expenditure up to the amount be sanctioned; that the design submitted showing a steel elliptical arch structure be adopted, and that the engineer be instructed to prepare the necessary plans and specifications.” This is a return to one of the original projects which it was judged desirable to abandon. A steel bridge will not have as imposing an effect as one of granite, but it is not likely that people will wait for several more years while a discussion on the relative merits of metal and stone goes on, for the new bridge is urgently required.

LAWYERS who have been unfavourable to the principle of arbitration when the judges are not barristers will be amused at the incident which arose in the King's Bench Division on Friday last. Messrs. KIRK & RANDALL, whose experience in carrying out building contracts is most extensive, are erecting a theatre for Sir CHARLES WYNDHAM. A dispute arose between the parties to the contract. In the deed there was a clause which enjoined that disputes, if any arose, were to be referred to an arbitrator who was named; or failing him, to another, likewise named. Messrs. KIRK & RANDALL found that arbitrator No. 1 was unable to act as he was about to leave town, and the circumstances were referred to arbitrator No. 2, who held in their favour. Sir CHARLES WYNDHAM in turn submitted the case to arbitrator No. 1, who had returned, and whose decision was to the opposite effect of the first—*i.e.* in favour of the building owner. Both parties endeavoured to obtain a decision of the Court. Counsel for Messrs. KIRK & RANDALL appealed for permission to have a brief discussion on the arbitration clause, as, although the works were going on, payment for them could not be made. The case is not common, for arbitrators generally are prepared to meet difficulties without loss of time. Their Lordships declined to interfere, and we think this ought to be taken as a suggestion that the parties to the contract should settle their differences out of court.

THE erection of M. GINAIN's new school of medicine has produced a transforming effect on that part of Paris in which the old buildings were situated. Four houses in the Rue l'Ecole de Médecine have survived, but they are doomed to demolition. The street was closely connected with the history of the French Revolution. One of the first acts of the new Government was the suppression of the monastery of the Cordeliers, a branch of the Franciscan order. The site was utilised for a medical school, and the refectory afterwards became the Musée Dupuytren. It was in the church the meetings of the “Club des Cordeliers,” founded by CAMILLE DESMOULINS, were held. The ancient Rue des Cordeliers became in 1790 the Rue de l'Ecole de Médecine. In No. 20 MARAT lived on the first floor, and there was assassinated by CHARLOTTE CORDAY. Afterwards the street was known as the Rue Marat. At No. 25 lived a grocer from whom the terrible veterinary surgeon obtained the paper on which he wrote his articles demanding the execution of all who were supposed to be aristocrats.

## ILLUSTRATIONS.

THE CLOTHWORKERS' HALL: THE GREAT HALL.

THE Clothworkers cannot be considered as forming one of the most ancient companies of London. Their incorporation was in 1482, while other companies can

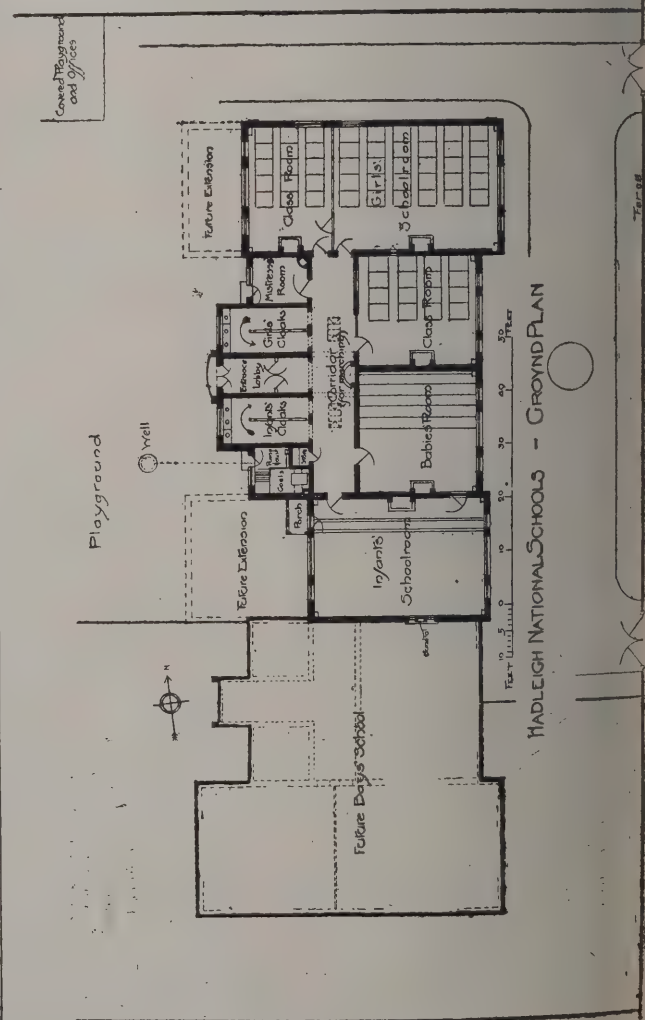

claim to be at least a century older. The Clothworkers seem to have been derived from the Drapers and Merchant-Tailors, the latter having received a charter in 1300. Originally the title was “The Fraternity of the Assumption of the Blessed Virgin Mary of the Shearmen of London.” Queen ELIZABETH reincorporated the members under the title of Clothworkers. Another company known as the Burrillers or Clothdressers existed from an early date, and the charter was confirmed by EDWARD III. The origin of the livery companies cannot be determined. Some investigators have supposed they were to be found in Roman London, others discover an Anglo-Saxon origin for them, but the general opinion is that they originated either in the desire of neighbours to meet together in order to escape the monotony of ordinary life, or that they were derived from guilds or confraternities, which seem to have been an established institution in Catholic churches.

## HOUSES AT BERKHAMSTED.

THESE four houses have just been completed on the King's Hill Estate. Owing to the site sloping sharply towards the south-east the houses are made as narrow as possible from front to back in order to save expensive excavation. The sitting-rooms are placed as far as possible to the front on account both of aspect and prospect. The materials are grey local stock bricks with Leverstock quoins; the whole of “Ty-Gwyn” and the upper parts of the other houses are covered with cream tinted rough-cast on the brickwork; the roofs are covered with Marston (Bedford) tiles. Messrs. NASH, YOUNG & HORNE were the builders of “Ty-Gwyn,” “Lindum” and “Braeside,” and Messrs. R. JONES & SON of “Elmcot.” Messrs. MARSHALL & BRADLEY, of Westminster, are the architects.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first meeting for the session 1902-3 of the Institute of Architects was held on Monday evening last at 9 Conduit Street, W., Mr. Aston Webb, A.R.A., president, in the chair.

The hon. secretary announced the decease of the late Mr. W. Salway, of Melbourne, elected Associate 1874 and Fellow 1885; Mr. George Truefitt, elected Fellow 1860, and placed on the list of retired Fellows in 1899; Mr. Charles France, of Bradford; M. Emerich Steindl, hon. corresponding member, elected 1894; and M. Eugène Muntz, hon. corresponding member.

It was announced that a statutory examination of candidates for the offices of district surveyor and building surveyor was held on October 23 and 24. The following candidates passed, and have been granted by the Council certificates of competency to act as district surveyors in London:—Mr. W. G. Perkins, and Mr. A. Halcrow Verstage.

The President said the Edinburgh Architectural Association had applied for an alliance to the Royal Institute of British Architects, and it was his pleasure to make known that the Institute do admit to alliance therewith under the provision of section xvii. (by-laws Nos. 77-81) the following Association, viz. the Edinburgh Architectural Association.

The PRESIDENT then delivered

## The Opening Address.

He said:—Colleagues, Ladies and Gentlemen,—Since our last meeting in this room two events of national importance have taken place—the dangerous illness and marvellous recovery of our Sovereign the King, and the Coronation of the King and Queen in Westminster Abbey on August 9, an event attended by all the splendour of the ancient rites and ceremonies which tradition has handed down to us as fitting for such an occasion; and it seems but right that the first words of the President of this Royal Institute should be to express on behalf of its members their thankfulness for this happy consummation of their hopes and aspirations.

My next words must be to thank you for the honour you have done me in placing me in this chair, an honour which carries with it many responsibilities, which I shall do my best to fulfil; but whether I succeed or not, I will ask you to believe that I am actuated solely by what I consider to be the best interests of architecture and of this Institute, in which I have always been a firm believer.

I am aware that my task is not made the easier by the admirable manner in which these duties were performed by my friend and immediate predecessor, Sir William Emerson; and I am glad to take this opportunity of publicly congratulating him, on behalf of the members of this Institute and myself, on the high honour of knighthood conferred upon him by his Sovereign, an honour which has given much pleasure and satisfaction to all of us, the more so that it is, I believe, the first time that a President of this Institute has been so honoured.

It is now my duty as your President to notice, as concisely as I can, some of the questions on the art and practice of architecture and the affairs of this Institute which present themselves to us at the present time, and in doing so I will ask you to understand that I in no way lay claim to any special fitness for this task, but that it is merely through the fact of my present position that I am privileged to do so.

On looking back over the last ten years I think we may fairly congratulate ourselves on the progress this Institute has made, the position it has attained, and, more important than all, the work it has done during that period. Ten years ago we had 1,400 fellows and associates; now we have nearly 1,700—not perhaps so large an increase as we could wish, but still a considerably larger increase than in the previous ten years.

It is true that our register still lacks the names of some distinguished architects whom we should like to see there, and whose presence would strengthen our power for good, not only in London, but throughout the country. Many of them we know to be well-wishers of this Institute and to appreciate the work we are doing; I can only say we should greatly value their presence amongst us, and should give due weight to their opinions on any matters in which they may consider that the policy of this Institute could be made increasingly useful in the interests of architecture.

Within the last few weeks we have been much gratified to receive a proposal for alliance from the Edinburgh Architectural Association, which you have ratified this evening. This Association has hitherto held somewhat aloof from us, and we shall, I am sure, all welcome the accession to our ranks of so earnest and able a body of architects, numbering many men who are really enthusiastic and doing good work, and though the distance between us is great, I hope we may not infrequently have the pleasure of welcoming some of their members amongst us here and that the alliance may prove of advantage to both societies.

It has often occurred to me how little we know of the proceedings of our allied societies, their aims and the matters on

which they feel most strongly, and that anything that would bring us more into touch with them would be a mutual advantage. With this view, one naturally turns to the Journal, so ably conducted by our secretary, Mr. Locke, and there we find our noble selves fully reported in all the glory of large print, but not much space given to the proceedings of our allied societies; and it appears to me that if that space could be increased, a portion allotted to each society, and if the societies would help us by sending up reports of their papers and discussions, we should all get to know a great deal more of what is going on in the country, and become more familiar with the men who are taking an active part in each society's affairs, while the information thus given would greatly widen the interest of our Journal. The addresses of the local Presidents could be printed, together with other papers and discussions; and these could, if so desired, be printed separately and issued to the members of the local society concerned, and thus each society could obtain an independent Journal of its own proceedings at a very moderate cost.

While on the subject of the Journal, I may say the editor would be very glad to receive communications from members which would add to the interest of the Journal, not only from Fellows, but also from our younger members.

The president of the Architectural Association of Ireland (Mr. F. G. Hicks), in his opening address the other day, said, speaking of his Institute, "It isn't a bit up to date, and there seems very little cohesion among the members, for they seldom have an opportunity of meeting." Well, I have heard something of the same sort applied to this Institute, that there is a lack of opportunity for members to meet and know each other, and I propose, with the permission of the Council, to give one or two informal "At Homes" here during the session, at which possibly smoking may be permitted (to bring us "a bit up to date") and where members may meet in a friendly way and get to know each other better, and I cannot help thinking that, if you will support me by your presence, some good may be done in this direction.

The admission of Fellows to this Institute can hardly yet be said to have arrived at a final and satisfactory settlement, and in my opinion this will not be done until Fellows are elected solely from the ranks of the Associates, except in very exceptional instances. But there are at present a large number of practising architects we wish to see Fellows whom we cannot expect to submit to our examinations. This is a matter which will have to be once more considered by your Council, more especially as the provision for the direct election of Fellows lapses in May next.

The financial position of the Institute is, I am glad to say, satisfactory. Ten years ago we had a capital of 5,800*l.*, now we have a capital of 11,500*l.* Then our revenue hardly balanced our expenditure, now it exceeds it by something over 1,000*l.* per annum.

It is obvious that this increased prosperity lays upon us the obligation of increased activity, for we are not a Society to accumulate funds, but rather to make proper use of those our increased prosperity supplies us with.

The question of premises is one that is always with us, and the increase of our office work and that of the library is beginning to make it a very pressing one. In many ways our premises here suit us well enough, but we now occupy the whole of the building, with the exception of the galleries, &c., on the ground floor, which we unsuccessfully negotiated for on behalf of the Architectural Association and ourselves in 1896. Failing these galleries, our power of expansion here has come to an end, and the alternative is to build premises elsewhere. This raises the question of a site, which I mention now, as it is possible some of our members may know of something likely to suit our requirements, and, if so, we should be glad to receive from them any information or suggestions on the subject.

The Council, on the suggestion of the finance committee, have started a premises fund, and have placed the sum of 1,000*l.* to this account.

A cause which I think this Institute should as far as possible assist is that of architectural education. The Institute, as an examining body, has deliberately left the education of architects to other architectural societies; and in this I think they have acted wisely, for the undue multiplication of educational centres is obviously undesirable. The Royal Academy has an excellent architectural school, visited and instructed by architects, but does not undertake very elementary work and deals with design only. The Architectural Association has recently started a day school, dealing with elementary work, and worthy of every encouragement. It is a scheme which, I venture to think, this Institute would do well to foster by every means in its power, both financially and otherwise, while individual architects could also do much to assist it by advising parents to send their sons for one or two years to the school previous to their being articulated to them.

These two schools at the Academy and the Association do to some extent overlap, and if a certain course at the Associa-

tion schools could be recognised as giving entrance to the lower architectural school of the Royal Academy, much in the same way as certain work at the public schools will admit a man to the University of Oxford, subject of course to any conditions that might be thought desirable, a great impetus would be given to both schools, and architects might at last feel that the education of the next generation was in a fair way to being placed on a satisfactory footing that would be capable of great development. There is, I think, no worthier or more unselfish object for this Institute to promote, or one that is more likely to influence architecture for good than the careful and systematic education of our young men, by a system which will not supplant the present system of apprenticeship, but will rather supplement it by supplying that which cannot be learned in an architect's office, or at least can be better taught systematically in a school.

Our examinations are, I believe, proving of real use to the younger men, and, judging by the increasing number that enter for them, they are fully appreciated. Ten years ago 305 went up for these examinations, while last year there were no fewer than 674.

The real benefit of these examinations is the work required in the preparation for them. We do not claim that they necessarily turn out artists (these are born, not made), but we do claim that, with the knowledge thus obtained, it enables those who are gifted with the artistic instinct the better and with the more certainty to realise their imaginations and aims. It is an object for a young man to work for and an inducement for him to acquire knowledge in some branches of our complex art which, though very necessary for its proper realisation, are apt to be neglected as uncongenial. In connection with this matter may I venture to hope that architects will give all reasonable facilities to those under them to undergo the necessary preparation.

The question of competitions is one of those questions that are always with us, and as long as architects see fit to enter for competitions it is plainly the duty of this Institute to do what it can to secure—first, the drawing up of such conditions as shall be fair to both parties, and at the same time not entail more labour on the competitors than is necessary to enable a competent assessor to arrive at a just decision; and secondly, to secure the adoption and execution of the best design.

With this end in view a series of suggestions for architectural competitions was drawn up by this Institute in 1881 and reconsidered and revised by the Council during the last session. These have recently been sent to all public bodies likely to organise competitions, in addition to which a copy is always sent to the promoters of a contemplated competition as soon as it is heard of by the officials of this Institute. But when all this is done there still remains the question of the appointment of the assessor, a matter of supreme importance both to the promoters and the competitors. Ever since 1881-82 architects have insisted that a professional adviser should be appointed in all open competitions, and in many cases the President for the time being of this Institute is asked to nominate the assessor, and after some inquiry into the matter I can find but little objection taken to the selections made or to the decisions given, bearing in mind, as I well know by experience, that the decision can seldom be thoroughly satisfactory to more than one of the competitors. It has been, however, urged by some that the selection of the assessor should be made by a small committee, rather than by the President, and that two or more assessors should be appointed in all competitions of any size. Personally I do not share this opinion, believing that the sense of individual responsibility is likely to give better results in both cases.

How far the system of selecting an architect by competition for the erection of any building is a desirable one will, I suppose, always be in dispute; but that it gives an equality of opportunity to all architects, great or small, known or unknown, is, I think, indisputable, and it has always seemed to me one of the strongest points in its favour, for we all could name men now doing excellent work whose first opportunity came by competition, and we know in this crowded world of ours how difficult it is for new men to obtain a hearing.

Before leaving matters more especially connected with the affairs of the Institute, I should like to say a word on behalf of the Architects' Benevolent Society. There are so many who faint by the way, and to whom a little temporary assistance is of untold value; there are so many others who have been worsted in the battle, and through ill-health and other difficulties have fallen out of the ranks, that great demands are made upon the funds of this Society. It is surely our duty to provide for them without going outside for help. Mr. Macvicar Anderson last year raised in a short time over 1,000*l.* with this object, a very handsome and most acceptable addition to the funds; but interest is very small now, and the cost of living very high, and the income of the Society still wants largely increasing. The Council of this Institute for the first time have voted an annual contribution of 20*l.* and there would be nothing pleasanter than to see the number of annual

subscribers largely increased during the present year. At present out of 617 Fellows only 191 subscribe, and out of 1,066 Associates only 70 subscribe. I venture to think that this ought not so to be.

And now, gentlemen, if I have not already worn out your patience, I will ask you to consider some questions of wider architectural interest than those we have been considering.

The interests of this Institute are with both old and new buildings.

Our interest in old buildings is to trace the history of their origin and growth, and to devise means for their maintenance and necessary repair.

The fall of the Campanile at Venice forcibly reminds us of the necessity for continual watchfulness as to the structural stability of ancient buildings, and the engineer's report on the foundations of our own St. Paul's still further emphasises the fact; and while these instances by no means justify undue interference or rebuilding of these structures, they show the danger of endeavouring to hand them down to posterity in exactly the same condition as we have received them. Most of the members of this Institute will, I think, sympathise with the desire of the Italians to re-erect their fallen tower, and be pleased that the Royal Academy has taken the lead in showing the practical sympathy of art-loving England with Italy in her loss. But how much better, by careful maintenance and judicious repair, to avoid such catastrophes.

In the case of St. Paul's a note of warning has been sounded apparently none too soon, and we look to the guardians of that great pile to take every precaution, on the best possible advice, to insure its safety, appealing to the Government for funds, should that be necessary.

But there is another and even greater danger threatening the buildings and antiquities of the kingdom which would rob us of much that gives this old country its charm. It is, I am afraid, a more subtle danger, and therefore more difficult to deal with. I mean the wholesale depredations of the "art" dealer.

I am informed on reliable authority that certain districts in this country are systematically mapped out by these gentlemen, and anything of interest, such as a panelled room, a moulded ceiling, a bit of ironwork even, a chest or a clock, are all carefully scheduled, the position and means of the owner ascertained, and, as opportunity offers, the property is purchased, the cottage or house often pulled down, the contents sold, generally abroad, and then the land, stripped of its little treasures, is resold. It is difficult to use temperate language about such proceedings; but surely it behoves us before it is too late, in conjunction with other societies, to see if it is not possible to take some united action to get these buildings and fittings registered as national belongings, so that, at any rate, they cannot be removed from this country—a course which, I understand, has already been adopted to some extent in France and Italy. This is work in which other societies are also interested, and we are always ready to act with them as occasion arises; indeed, it interests and affects all educated Englishmen.

It is in modern architecture, however, and its allied arts that our influence is naturally most likely to be exercised, especially at a time of such exceptional building activity as the present.

The Government is largely engaged in the erection of public buildings; local authorities all over the country are busy with the erection of town halls, asylums, schools, technical institutions, &c.; while the buildings, residential and commercial, in our great towns continue to increase at almost an alarming rate. What, I think, must strike most of us in all this activity is that while minute control is exercised by public authorities over the details of these buildings, such little control is exercised over the laying out of our cities that to a great extent they seem to be left to lay out themselves.

How often we see a really noble and costly building hidden away in some inconvenient and cramped site without any approaches worthy of the name, simply because the land was easily obtainable or happened to be vacant at the time; or could be obtained cheaply, or to improve the value of adjoining property; reasons we have heard put forward repeatedly, but nearly always resulting in the loss of a great opportunity of ennobling and beautifying the town; while, instead of money being saved, as is foolishly supposed, money is really wasted and thrown away.

A predecessor of mine in this chair once urged when heading a deputation on the erection of a public building that the extra cost necessary for its worthy completion would, even from a commercial point of view, be soon repaid by the increased attractiveness of the city, and the number of visitors that would be drawn to it. The suggestion was received as if it was not seriously meant; but surely there is force in the contention, though it is but a secondary reason for urging on the public authorities the importance of so placing their public buildings that they may be the ornament and crowning feature of the town.

Why is the National Gallery site so frequently pointed to as an ideal one? Surely because it has, as so few buildings have in London, a slightly elevated site, with a large open space in front of it, and is approached by a main thoroughfare leading directly to its façade. The Royal Exchange has a fine site, for a similar reason. When carefully planned the most splendid approaches to St. Paul's, which would have made the City one of the finest in the world, but the greed and disputes of the citizens unfortunately prevented his scheme being carried out. Most of our public buildings have no dignified approach, and usually a general view can only be obtained in a sharp perspective from the roads which run past them, not up to them, and, as Wren says, they are seen sideways. The matter is of still more importance now that the picturesque manner of the Houses of Parliament and the Law Courts is giving place to a more palatial and formal style. Continental towns set us a great example in this respect, and though we may consider their love of straight avenues and boulevards is often carried to monotony, we cannot but admire the dignified and monumental surroundings they almost invariably contrive to provide for their buildings. I would venture to assert, though it should surely not be necessary, that every public building should be entirely detached, and should stand on a site of an area at least half as large again as the area which the buildings actually cover, and that they should, wherever possible, have a fine road leading up to them. The Americans, who are generally credited with a keen eye for the financial side of a question, are fully alive to this point, and are laying out their cities with great monumental dignity. It seems almost impossible to exaggerate the importance of the architectural surroundings of a building. In the case of private houses some architectural support in the way of steps, walls and terraces is now usually designed, though unfortunately by no means usually carried out, and one has only to look at the design and the executed work to see how great the loss has been. But if important in a house, how much more so in a great public building. And yet in England how often is this entirely ignored.

Another matter which I notice in London and other places with regret is the disappearance in the new quarters of the old-fashioned "square," which adds so much to the appearance of the older quarters. The new-fashioned "gardens" apparently have taken their place, the difference being that while a "square" was bounded by a public road and had the fronts of the houses facing it, the "gardens" have no surrounding road, and the backs of the houses abut immediately upon it. The result, of course, is that while the "square" adds greatly to the variety and beauty of our streets, the "gardens" are entirely hidden away, and might be non-existent as far as the public thoroughfares are concerned. The advantage claimed is the increased privacy obtained for the "gardens," counterbalanced, surely, by the improved outlook given by the "square" to the front of the houses, while the somewhat sordid surroundings of the "garden," with its rows of back windows and its stagnant air, hardly make for beauty or restfulness.

Numerous other points in the laying out of our cities will occur to all of us, but I mention these two with a view to asking whether something could not be done to insure that all such matters should be duly considered while improvements are under contemplation and before it is too late. I venture to think that these are matters in which this Institute and our allied societies can do important public service.

The design and details of buildings are a matter for the individual artist, and not one, in my opinion, in which this Institute can often, if ever, usefully interfere; but when great improvements are in contemplation the opinion of such a body as ours, composed of societies all over the country, may, I think, be of great use to the public authorities. Never, I feel assured, was there a time when our corporations and county councils were more anxious to do all in their power to improve the æsthetic aspect of our cities and towns, or more willing to avail themselves of every means to that end that may be open to them. The Government and the London County Council have frequently consulted this Institute on matters of architectural importance, and other public bodies do, from time to time, consult with their local architectural societies. Something, however, more definite seems to be required than this.

At present, as we all know, we architects are unable to erect any building in any of our towns without first submitting very complete plans, and in many cases elevations and specifications to the borough surveyor, who exercises, under the local by-laws, strict supervision with regard to height and size of rooms, windows, thickness of walls, the minutest details of drainage and other matters, but when it comes to laying out suburban districts, street improvements and such like, which call for the highest qualities of the architect, the plans are usually drawn by the borough surveyor, and subjected apparently to practically no expert criticism whatever.

Now, might it not be required that when such schemes have to be prepared they should be submitted for criticism and advice

to some expert architectural authority, such as, say, the local architectural society, who might also be asked to nominate an architect to consult with the surveyor in preparing the scheme and in the event of the corporation or council and the architectural society not agreeing on any point, might not the question be referred, say, for example, to the Council of this Institute? It surely could not be argued that this would be derogatory to the borough surveyor, for, as we architects cheerfully submit our proposals to the surveyors, there would seem to be no impropriety, but quite the reverse, in the surveyors laying their architectural schemes before the architects, and in important architectural schemes working with them.

In saying this it must be understood that I am not in the least impugning the capacity of the borough surveyors. They are, we all know, an exceedingly able body of men, but they are selected for these posts on account of their fitness and acquaintance with subjects somewhat apart from architecture proper, the study and practice of which subjects do not especially fit them for the designing of work of the highest architectural importance. They are, I venture to think, liable to have great pressure put on them to sacrifice too much to the very important questions of convenience and economy, and if this is so a further independent opinion would greatly strengthen their hands.

The tendency in recent years has been with corporations to substitute for the official "architect," as he used to be called, the surveyor; and this is, probably, the most reasonable course, for the matters which the works department of a corporation or council have mainly to superintend would more perfectly come under this heading, but it would seem reasonable that, when strictly architectural matters have to be dealt with, they should be subject to the criticism of architects, not necessarily officially connected with the local body.

I have dealt with this matter at some length, because it seems to me one in which the Institute could be of real use, and because it is one which so greatly affects the beauty of our cities and towns.

Another matter to which the attention of this Institute has been called is the local building by-laws in many rural or practically rural districts. This may at first sight seem a subject very remote from architecture, though in reality, as many of our members know, it affects architecture very much. These by-laws for rural districts are often drawn up on the lines of the building laws of large towns, they impose most unnecessary and burdensome conditions on those building in the country, and though the attention of the Local Government Board has been directed to the matter, and a deputation has been received, but little more has been done.

The London County Council have schemes on hand of the greatest magnitude, and they have, as is well known, consulted this Institute with reference to the great new thoroughfare from Holborn to the Strand. Unfortunately they were not able to adopt our suggestions in their entirety; but their committee, with the best intentions (which they appear not to have been strong enough to carry through), obtained designs in a limited competition, and a report upon them by an assessor, whose decision everyone would have been willing to abide by. This report, however, was not made public for two years, and appears to have remained a dead letter since, and now, I believe, this Institute and the public are absolutely in the dark as to whether there is to be any general scheme or control over the buildings to be erected, and, if so, by whom this control is to be exercised, whether each plot is to be let to the highest bidder without any reference to a general scheme, and finally what has become of the design placed first in the assessor's award; and yet it is hardly too much to say that in almost any other capital in Europe it would be looked upon as a matter of public and national importance, and surely it is one on which all are entitled to be informed.

In these public matters connected with architecture the daily Press might do much to educate public opinion; without the aid of the Press little is likely to be done. But in order to have the necessary influence architectural matters must be treated with a complete and thorough knowledge of the subject, as is usually the case in matters affecting the cognate arts.

The encouragement of local schools of art by their municipalities is another matter that should interest this Institute. It will be remembered that when London was being decorated for the recent Coronation the decoration of Westminster Bridge was entrusted to the Royal College of Art, and mainly through the instrumentality, I believe, of Sir William Richmond funds were provided by the London County Council for the purpose, the students giving their services. A very ambitious scheme was prepared and carried out, though, owing to the postponement of the Coronation, the scheme hardly received the attention it deserved, but I have reason to believe it gave a great impetus to the work of the college, the students devoting much enthusiasm to a scheme which was not a mere exercise, but one in which their work was actually to be seen in position. To I think the London County Council and all concerned are to be congratulated on this experiment, which might be usefully

followed throughout the country, for there are many buildings required for temporary purposes, such as those for exhibitions, receptions, rejoicings, meetings, all of which require erection and decoration, and present precisely the opportunity required for students to try their hands upon, and so to learn how much their work gains or loses when seen in reality, and in other surroundings than the studio in which it has been prepared. The employment of students in temporary work such as this is better than their employment on more permanent work, where their inexperience remains recorded against them, and may only end in discouragement. Besides it is only comparatively seldom that an opportunity for permanent work occurs, and when it does it is more properly reserved for men who have passed through the schools, gained experience and proved their ability. On the other hand, the temporary work gives the opportunity so much desired by students, and should it prove unsatisfactory it is soon removed and forgotten; besides, their employment should greatly increase the interest of the municipalities in their schools of art and the students who work in them. Much has been written lately of municipal socialism; we could, I think, do with a little more of it in this direction.

While considering the responsibilities of municipalities towards the encouragement of the arts and crafts, we may remind ourselves of the responsibilities that lie also with us. We rightly have a voice in the selection of the artists and craftsmen who work on our buildings, from the sculptor and painter who decorate them to the locksmith and upholsterer who furnish them; great encouragement may be given to the subsidiary arts if we take the trouble to find out individual artists to work with us in the various branches of the applied arts, and while fully illustrating our intentions give them sufficient freedom to carry out their own imagination and inventiveness, with their full share of credit for it. Depend upon it, great discouragement is caused to earnest workers, and much harm done, if just to save ourselves time and trouble we take the first article of commerce that comes to hand. Think what a school of craftsmen the enthusiasm of Pugin raised, producing work which is really little short of marvellous when we remember the sort of work that was being done at that time. We still feel its beneficial effects. Gilbert Scott, William Burges, J. F. Bentley and many others, both dead and living, have done the same; it is certainly one of the directions in which we can do incalculable good or ill to our art, and it is a responsibility of which we cannot and must not divest ourselves.

Smoke abatement is another matter this Institute may do something to assist in. The thick dark veil that falls over all our buildings is distressing in the extreme. One of the principles which Wren laid down for the rebuilding of London was, "all trades that use great fires or yield noisome smells to be placed out of the town," and we should see to it in this day that trades which cannot control this nuisance should be made to go outside.

Gentlemen, I cannot conclude without reference to one building recently erected, the Cathedral Church at Westminster, and its gifted architect, the late John Francis Bentley. The erection of a great church like this in the Metropolis is necessarily so rare an event that under any circumstances it would attract attention; but when, as in this case, the work was designed by one of the most inspired church architects of our day, and on lines different from any erected in recent times, it has naturally interested all of us, and excited in most of us an enthusiastic admiration. I do not propose here to give a critical notice of the building—that has already been done from various points of view, by abler pens than mine—but rather to enjoy the pleasure of noting the erection of a modern building in which all can unite in finding much to admire, though it will be a matter of lasting regret that its architect was not spared in health to witness the completion of his labours, and to receive the congratulations attending the consummation of so great a work nobly, and one may say in his case heroically, carried through.

The present generation will probably have seen three cathedrals of the first class in course of construction, viz the cathedrals of Truro, Westminster and Liverpool, the first, nearing completion, designed by one who mastered the old Gothic methods and feeling perhaps more entirely than any of his contemporaries, and who has produced a beautiful building, which might almost, so perfect is it, have been erected in the thirteenth century, and is probably destined to mark the high-water mark of achievement in the revival of a Mediæval style.

At Westminster the problem was different from that required by the traditional Gothic plan of a cruciform church, with deep choir and transepts; and this difference naturally and properly affected the whole design, and while an enormous uninterrupted area has been provided for the assembling of large masses of worshippers, the mystery so necessary for the interior of a religious building has been admirably preserved by the careful lighting, the simple intricacy of its arches, its piers, its ambulatories and its chapels. It is a step forward in church building nobly planned, and one for which we may be all

unreservedly grateful. I would only venture to hope that some day the entrance front may be better seen from Victoria Street by the removal of one or two houses, and that the interior of the building may in due course be worthily completed.

The last cathedral, Liverpool, is still one of the possibilities of the future; let us hope that it may prove, when erected, yet another step forward. I have already expressed my own opinion that the author of the design named as the best in the first competition should have been given an opportunity of showing what he could do on the new site; it has, however, been decided otherwise. The request in the first conditions for the second competition, that the building should be designed in a certain style was a curious instance of the inability of the public to trust architects to design for them what is more suitable, for though this condition has been since withdrawn, it is, I believe, generally understood that the promoters remain of the same opinion still. We can only hope that the best man may finally be entrusted with this great monumental work, and that, when it is completed, he may be rewarded by the unstinted admiration of his brother architects, the highest reward any of us can hope to gain.

We, all of us, lavish endless praise on old work, but are, perhaps, too chary of bestowing it upon that of our own time. If we are always contrasting the greatness of old work with the inferiority of the new, can we wonder if the public take the same view, and ask us to reproduce for them what we all so greatly admire? It is true we cannot reproduce old work; but the public do not understand that, for we do not teach them so. Great painters are not asked to paint in the style of Giotto, Fra Angelico, or Titian, and would not do so if they were. Excellent copies of these great masters are made; and in a few years are sometimes mistaken for the originals; but they are not made by our great painters, and are esteemed of little worth. Sculptors no longer masquerade our living statesmen in Poman togas, or attempt to reproduce a Jubilee procession in imitation of the Panathenaic frieze. Why, then, should we still be asked to design in the thirteenth century or any other bygone style? Because, we are told, we have no style of our own. But are we quite sure that a tradition once broken can never be revived again? And are we quite certain that the Renaissance tradition has ever been entirely lost in England? I do not think so. Are we going on for ever telling our young men they must not only study but copy old work, for they can never hope to produce anything equal to it? Is that likely to give them inspiration? Are we to tell them that, while painting and sculpture are alive, the last word has already been said on architecture? There cannot be an architect who holds this opinion, though I am afraid, under present circumstances, we cannot wonder if the public do so. I am not thinking of that will-o'-the-wisp, a new style—that may or may not come, I do not know; but rather suggesting that by a generous appreciation of modern work, and by boldly and generously showing our belief in it, good contemporary work may be encouraged and abound among us, so that the public may come to believe and be interested in it also.

There is one quality we all desire in our buildings, whether we attain it or not, repose, a quality we find alike in buildings so dissimilar as the exterior of St. Paul's and the interior of Westminster Abbey, in St. George's Hall, and even in that ornate river front of the Houses of Parliament. It is the result of good proportion, arrived at by matured knowledge, and guided by a true artistic sense; it is entirely independent of styles, it combines simplicity without baldness and richness under control. It is a quality that can be felt, and, as Wren says, "Aims at eternity."

Sir L. ALMA-TADEMA, R.A., proposed a vote of thanks for the address. He said allusion had been made therein to the question of education. This was a matter of great importance to architects, and so, too, was the question of apprenticeship. He believed that if apprenticeships to the architectural profession were abolished the art would suffer. He was convinced that it was dangerous for young men to travel in order to understand art. He said he felt men would get nearer attaining the long-desired national style if architects stayed more at home and learnt from the architecture of England.

Mr. J. MACVICAR ANDERSON seconded the vote, which was carried with loud acclamation.

## ECCLESIASTICAL DILAPIDATIONS.

AT the Lichfield Diocesan Conference the Rev. Prebendary Bolton presented the report of the committee appointed at the last conference to report on Mr. A. De Bock Porter's scheme and others for the amendment of the present law relating to ecclesiastical dilapidations. The report was as follows:—"Your committee have had before them Mr. De Bock Porter's scheme and also the other schemes set out in the appendix to the report of the committee of the Lower House of Convocation. Mr. De Bock Porter's appeared to be

the most practical one, and therefore they did not consider the others in detail, but went through Mr. De Bock Porter's clause by clause, and they recommend the conference to approve of it generally, but to express no opinion as to the amounts set out in clause 6 as being the payments likely to be required; and with respect to clause 7 they recommend that the payments in respect of glebe buildings, fences and drains be assessed upon the rateable value of the glebe lands exclusive of the parsonage house. The committee are unanimous in thinking that an annual payment to some central fund in respect of dilapidations should be compulsory upon every incumbent who occupies any glebe house or buildings. A considerable majority are in favour of the general principles of Mr. De Bock Porter's scheme; but some members of the committee think that the scale of payments with respect to parsonage houses should be based not, as he proposes, on the net income of the benefice, but on the rateable value of the premises belonging to it; and others think, on the contrary, that the scale of payments not only for parsonage houses but also for glebe buildings, fences and drains, should be based, as Mr. De Bock Porter proposes it should with respect to parsonage houses only, on the net value of the benefices. The conclusions of the committee, however, are those set out in the first part of this report."

Prebendary Bolton then moved:—"That this conference approves generally the principles of Mr. De Bock Porter's scheme for dealing with ecclesiastical dilapidations, and recommends the clergy to accept it as the best solution of the question." He said it was quite possible to riddle this scheme with objections, and that was why he asked the conference to accept the principle and general outline of the scheme. They were no doubt all agreed as to the desirableness of insurance in regard to life and property, and why should not the principle of insurance be as advantageously employed in regard to the wear and tear of church buildings? If this insurance scheme was approved an incumbent would know the worst and would not find himself face to face with large arrears. The premises would always be in order, and when a man died his widow or executors would not have claims made upon them which they could not pay, and the incoming incumbent would not have to pay money for dilapidations for which he was in no way responsible. Another important point was that special concessions would be made to livings of small value. The administration of Church property by the Ecclesiastical Commission had been immensely advantageous to the temporalities of the Church, and led to the belief that in their hands the dilapidation fund would be well administered and the glebe houses kept in good repair.

Mr. Lloyd Kenyon said as chairman of the committee by which the report was drafted he seconded the resolution without any hesitation in spite of the fact that he was also chairman of a committee which recommended a somewhat different scheme. That scheme was embodied in what was called "The Diocesan Commissioners' Bill," and to this scheme the conference was pledged. In that scheme they proposed, as Mr. De Bock Porter did, that every clergyman should be compelled to pay so much a year, in consideration for which his dilapidations would be provided for. They also proposed that the scheme should be managed under the direction of the Ecclesiastical Commissioners, and to these two points the conference was already pledged. Where this scheme differed from Mr. De Bock Porter's was in a number of details. The Lichfield Bill proposed that the payment should be made on the result of the architect's survey. Mr. Porter proposed that the rich livings should help the poor ones. It followed that if Mr. Porter's scheme was approved a living worth 400*l.* or 500*l.* a year would pay more than the actual dilapidations would probably cost, but that was not a necessary principle of Mr. Porter's scheme. That communistic principle could not, of course, be adopted without the approval of the clergy, but they might approve of the general principle of the scheme, and that was what he hoped they would do. The committee were unanimous in recommending that every clergyman should be compelled to pay so much a year, and that the dilapidations should be provided for by an outside authority. That was imposing no new burden on the clergy, as every clergyman was already bound by law to keep his buildings in repair.

The Rev. G. T. Royds said he desired to move the following amendment:—"That this conference is of opinion that no scheme which would increase the cost of up-keep (however satisfactory in securing the good condition of the glebe buildings, &c.) would be acceptable to the clergy, and that unless some scheme not open to this objection is put forward some compulsory form of insurance by which an adequate sum would be forthcoming in case of vacancy would prove the best method of providing for dilapidations." He said he opposed the adoption of the resolutions tooth and nail, because he believed that by no possible scheme could they secure the carrying out of that highest possible Christian principle of the rich helping the poor in this matter. He was satisfied that they could not pool the livings in such a way as would

secure this end. He was at one as to some compulsory form of insurance.

The Rev. J. R. Pyle seconded the amendment, remarking that he opposed Mr. Porter's scheme because he believed it would unnecessarily increase the burden upon the clergy instead of decreasing it. He considered that the scheme was one of the most cruel proposals to help the clergy out of their own pockets that had ever been brought forward.

Archdeacon Maude said the archdeacons only had the power to make a representation with regard to dilapidations when there was some glaring need for repair. The present Archbishop of Canterbury, who was a very good business man, strongly supported Mr. De Bock Porter's scheme.

The Rev. T. Auden said he supported the resolution. This was a case in which the Church must hang together as a whole. They must be ready to help one another.

Archdeacon Lane said he was in favour of Mr. Porter's scheme, because it would give them not only regularity of inspection but uniformity of inspection. They wanted the question of inspection reduced to a simple matter of business.

The Rev. C. W. Carrington said he was strongly in favour of Mr. Porter's scheme, because he believed it would be a Godsend to the whole Church. For his part, he should like to see the incomes from all the livings passed through a central fund, so that each clergyman might know what he was going to receive.

Mr. C. Lynam said he objected to the scheme because no provision was made for the improvement of the glebe lands, fences or buildings, which constituted a not inconsiderable portion of ecclesiastical property.

The President said he could not very well support the resolution as it stood. He was not prepared to recommend Mr. De Bock Porter's scheme as the best solution of the question. It was a scheme which required a great deal more consideration, and it had not been fully worked out by Mr. Porter himself. The whole subject had been under the consideration of both Houses of Convocation. The Lower House of Convocation had published its report, and the Upper House had published an interim report, in which they confessed that they were not able to make any representations at present. As the clergy knew, he sent out some time ago a circular to all rural deans asking them to consult the chapters and conferences on the subject, and until they got the returns he should be sorry for that conference to pledge itself to any one scheme. There were two recommendations in the report which were unanimously passed, and it would be more satisfactory if the mover and seconder of the resolution submitted to the conference would agree to substitute these recommendations. They were—(1) "That an annual payment to some central fund in respect of dilapidations should be compulsory upon every incumbent who occupies any glebe house or buildings," and (2) "That the payments in respect of glebe buildings, fences and drains be assessed upon the rateable value of the glebe lands, exclusive of the parsonage house."

These recommendations having been accepted by Prebendary Bolton and Mr. Lloyd Kenyon, the Rev. G. T. Royds withdrew his amendment, and they were carried with two dissentients.

#### CANON'S ISLAND ABBEY, CO. CLARE.\*

THIS structure, which was recently vested under the provisions of section I of the Ancient Monuments Protection Act, 1892, was taken in hand and repaired during the past summer. It is a rather extensive ruin of a church and conventual buildings which formerly belonged to the Augustinian Order; its foundation is ascribed to the last king of Munster, Donald Mor O'Brien, in the twelfth century. The buildings occupy a site on the northern portion of a small island, originally named Illaun na Ganonagh, of 222 acres in extent, situate at the confluence of the river Fergus and the Shannon, about three miles in a direct line north-east of Killadysert.

Of its historical record but little is known prior to the Dissolution. In A.D. 1483 a bishop of Killaloe, named Mahon O'Griffy, was buried here. Henry VIII. granted it to Donatus O'Brien and it was afterwards given to the Earl of Thomond. It was confirmed to James Duke of York (afterwards king) under Act of Settlement in 1669, and in 1712 it was granted by the seventh Earl of Thomond to Richard Henn. It passed from the Henn family into the hands of Lord Leconfield, who executed a fee-farm grant to Mr. Fitzgerald. In 1897 Mr. W. W. Augustine Fitzgerald, then high sheriff of county Clare, and his tenant, John Hastings, who holds a lease of the farm of which the abbey and its precincts form a part, vested the ruin in the Commissioners of Public Works as a national monument under the Act.

The abbey does not seem to have had endowments of any great value. From the Inquisition of A.D. 1577 it appears to

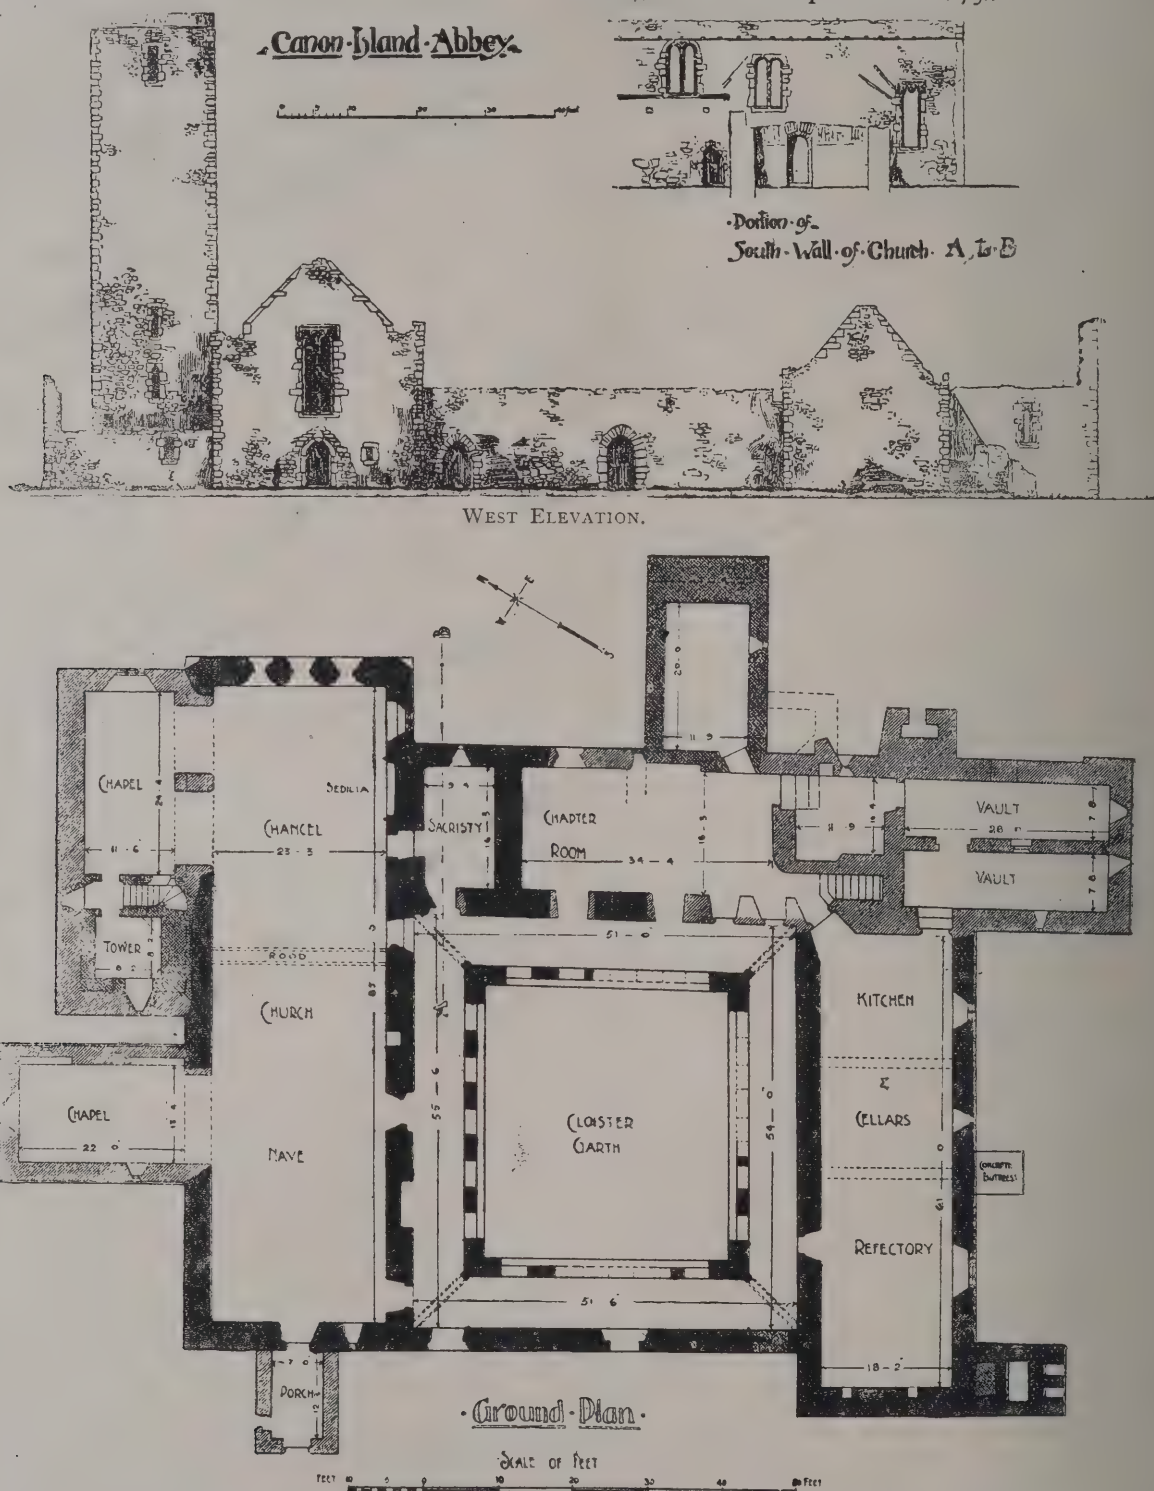

\* From the Report of the Commissioners of Public Works, Ireland.

have possessed four acres arable and fourteen of mountainous pasture with the abbey site of half an acre. Some of the other islands in the estuary of the Fergus belonged to it as well as two parts of the tithes of Killadyserf and the vicarage of Kilchrist on the mainland.

The site of the ruins is surrounded for the most part by a circular fence or cashel, now entirely covered with shrub and bramble. This enclosure is of stone, built roughly, about 12 to 15 feet wide at the base, and portions of it are 8 feet in height. This cashel is much older than the ruins, and no doubt enclosed residential buildings before the site was devoted to monastic purposes. Primitive establishments erected inside such an enclosure are found at Inismurray and elsewhere.

building a new church. This leaves the most interesting parts of the structure wanting in detail, and in the work of conservation, just executed, the gaps left by this gutting have been filled in with cement concrete (without any mouldings or carvings) where it was necessary to secure the stability of the walls. The other work done consisted chiefly in clearing the walls of the dangerous ivy and the interior of the fallen masonry, bramble, trees and rubbish, and pointing the walls where defective with cement mortar and protecting the top of the walls with a coating of concrete so as to preserve them from the infiltration of rain. The work was carried out by workmen at a daily wage, under the supervision of a clerk of works, and the total expenditure was 75%.

The existing remains consist of a church with tower and chancel and an aisle or side chapel, and transepts all at the north side. (See plan) The cloister garth, around which are grouped the usual conventual buildings, is on the south side.

The whole of the space within and around the walls, save in the nave and side chapels where burials take place, were filled with stone and rubbish covered with a dense mass of brushwood and bramble, with ivy and saplings growing out of the masonry of the walls. The ivy had injured the walls seriously by dislocating the masonry.

Some years ago all the cut stonework of the east window and the quoins of the gable and all other cut stonework easily accessible were taken out and removed to the mainland for

The following is a detailed description of the different portions of the structure:—

#### *The Tower.*

The tower appears to have been planted into the interior of the added north aisle or side chapel. In the interior lining of the walls of the tower the character of the masonry is of a better class and of later date (fifteenth century). At this time the small window at the foot of the stairs was inserted in the old work, as well as another narrow window 4 inches wide in the west wall of tower.

On the first floor are three windows—one in the western wall and two in the northern, one of which was intended to

light a small lobby at the head of the stone stairs, but appears afterwards to have been used as a sink for the discharge of slops through the wall.

On this floor there is a well-defined squint which would give a view of the high altar from the first-floor chamber in the tower. Between the tower and the church are traces of stone dressings, which indicate that an opening was formed here for the purpose of giving access to the rood-loft or gallery over the rood-screen.

There are stone corbels in the nave at this place, which supported the gallery across the width of the church.

The tower is different to most ecclesiastical towers of the period, inasmuch as it indicates in its construction features pointing to a residential occupation. In the Franciscan houses, when the fashion came in for erecting towers in the fifteenth century, they were placed between the choir and nave. In the case under notice that position was not adopted, and it is not clear that the tower was intended to carry a bell, as there is no large window at the belfry stage, such as was always found in towers intended for bells. It was, therefore, apparently intended as a fortified residence; access to it was obtained only through the northern side chapel. There were four floors in addition to the ground floor, only the first floor was vaulted. The corbels supporting the other floors are still observable. In general character this tower bears a strong resemblance to many of the smaller castles of county Clare, built during this period. A similar tower was added to the church of Killadysert for a like purpose. It would seem as if some of the conventual buildings at Canon Island had fallen into disuse, and that the tower had become the residence and place of refuge of a few clerics. It could hardly have been intended for the prior's lodgings only.

#### *North-East Chapel or North Aisle.*

This chapel measures 24 feet 4 inches in length east to west, by 11 feet 6 inches. It has an arcade of two pointed arches, opening into the choir without any cut stonework. The pier has chamfered jambs on the face next the choir. This chapel would appear to have been a late addition (probably early fourteenth or late thirteenth century); a three-light window in the east, now bereft of centre mullions and tracery, is of this date. The north wall of the church was originally 3 feet 7 inches in thickness, but when the chapel was added the wall was increased to 5 feet to strengthen the pier and abutments of the two arches.

#### *North-West Chapel.*

This chapel measures 22 feet north to south by 13 feet 4 inches east to west, and appears in the form of a transept, the eastern chapel partaking of the character of an aisle. It is approached from the nave by a pointed arch 11 feet 9 inches in width. This chapel has a two-light window with semi-circular heads in the north gable. There is a small window in the eastern side wall, square-headed. There are two altar recesses in the side wall of this chapel and an aumbrey; the recesses are not arched over, but each has a corbel at the jambs which projects and carries a flat lintel. There is a small square-headed window in the western side wall.

#### *The Nave.*

The external approach to the nave is through a porch, 12 feet 3 inches in length east to west and 7 feet in width. The walls are 1 foot 9 inches in thickness. The entrance doorway has chamfered jambs and a pointed arch (see western elevation), and a similar doorway opens into the nave. The church measures in its extreme length between the east and west gables 85 feet. There is now no trace of a division between nave and choir except what may be inferred from the position of corbel blocks in the side walls, evidently intended to carry the rood-beam and loft over the screen separating the nave from the choir. If we adopt this supposition as correct, it would give a nave measurement of 48 feet in length and a choir of 37 feet in length, each measuring 23 feet 3 inches in width. At the entrance to the nave, on the south side, is an arched doorway leading directly into the cloisters. There is another similar doorway in the cloister walk further on in the south wall, with a holy-water stoup in the angle of the west jamb having two openings into it, one from the doorway and one from the church. Nearer the screen is a small recess, apparently an aumbrey, used probably in connection with an altar placed before the screen dividing nave from choir.

#### *The Choir.*

The choir was lighted by a large window of three separate lights divided by two solid piers. The whole of the cut stone dressings of this fine window, except those of the discharging arch in the gable over the three lights, were taken out of their position and carried off from the island with the intention of using them for building purposes, and the window now presents a very ragged appearance, with large gaps in the jambs and arches from which the cut stonework was removed.

There is still a stone *in situ* which gives an outline of the mouldings which decorated the inner jambs. This moulding

was carried up as a shaft to the springing of the arch, where it was surmounted by a small capital. The general finish was somewhat similar to the three-light window in the east gable of Kilfenora Cathedral.

In the south wall of chancel there is a two-light window inserted of late fifteenth century date. This window presents some peculiarity. It has a straight splay to west jamb internally, and the recess is arranged so that the cill is stepped to different levels. It has also a curious sinking in the internal face of the dividing mullion carried also round the jambs.

The choir has two other windows in the south wall at a higher level, one of which is a two-light semicircular headed window of late date, and it opens into what would have been the roof space over the sacristy. The weathering course of this roof appears on the face of the wall; it is difficult to account for this position of the window unless it was inserted at a period when the roof abutting against the choir wall had been removed.

In the choir is the usual recessed space for the sedilia. There is a stone seat with cut stone jambs and arch, the latter of ogival form with finial; at each side is a small projecting pilaster terminated by a finial.

A doorway from the choir leads into the sacristy, an apartment 16 feet 3 inches by 9 feet 4 inches. A door leads from it into the east cloister walk. This door is an insertion.

The cloister walks on the four sides of the garth or cloister enclosure are well defined. A simple arcade of five openings in plain hammer-dressed stone piers runs round each side; each opening measures 3 feet 6 inches in width. There is nothing to indicate whether these openings were arched over or had merely a stone lintel; the latter is most probably the case, but at each of the four angles are cut stone ribs and corbels rising from chamfered shafts connected with the cloister wall with caps and bases.

In the south wall of church and north side of cloister is an arched recess 6 feet in width, which may have been a shrine or formed space for a seat or cupboard for books. The ranges of buildings to the south of sacristy are in a very ruinous condition, and the position of the chapter-house cannot be very clearly defined, and there are traces of many changes. There are no traces of fireplaces in any portion of the ruin save in one of the vaults at the south-east angle, where a recent opening has been made in the arch to permit the escape of smoke. The range south of the cloister is in one apartment, the larger portion of which, at the western end, was used as the refectory, and over this was a range of dormitories.

The interior of the church is used as a burial-ground by about twenty families on this and the adjoining islands, and a number of headstones disfigure the ruin. The burial-ground is under the control of the local Board of Guardians.

The south wall of refectory range was dangerously overhanging, and it was necessary to support the wall with a concrete buttress. A concrete floor was put over the vaulted roof of the buildings at south-east angle to protect the masonry. The use of concrete in work of this kind has the advantage of showing distinctly what new work has been done and the extent of it.

## THE INSTITUTION OF CIVIL ENGINEERS.

THE eighty-fourth session of this Institution was opened on Tuesday, when the president (Mr. J. C. Hawkshaw) delivered his inaugural address.

The President, who was cordially received, said the century which had just closed would always be memorable for the birth and growth to maturity, and, as some might say, to an honourable old age, of traction by steam-power on railways. Far-reaching as the results of this growth had been throughout the world, this country could not have reaped so rich a harvest from it without a corresponding growth of our dock system, which had also made its mark on the nineteenth century. That we required deeper docks with deeper entrances to them was because iron had taken the place of timber in shipbuilding, so that the use of iron had not only revolutionised shipbuilding, but had necessitated the rebuilding of our docks and harbours. The progress of the last century had been mainly due to the use which had been made of the metal, iron. In their enthusiasm for the great results achieved by this new material they might overlook what they had owed in the past and what they still would require in the future from an "old-world material," timber. Engineers here could not do without timber, nor, indeed, without much timber. For the last thirty years they had heard it said in that room that steel would shortly be adopted in place of wood for sleepers; but although we could make our own steel, but had to import our timber sleepers, this had not come to pass. France had experimented for years in iron and steel sleepers; but few were laid in France, which, in spite of her well-managed forests, had to import sleepers. More metal sleepers are used in Germany, also a timber-importing

country, but Germany used much wood still for sleepers. Metal sleepers were used in South Africa, and, together with native timber, in Australia, India and South America. In Argentina some of the iron sleepers had recently been replaced by native wood sleepers. The United States and Canada use wood only, and use more wood for sleepers in proportion to their railway mileage than in any other country, 2,500 to 3,150 being laid to a mile in the former, and 2,600 to a mile in the latter, as compared with 1,760 to 2,145 a mile in this country. The consumption of timber for sleepers increased yearly, and more are now laid to a mile than formerly, especially in the United States and Canada, but there is a tendency to slightly reduce the number in the United States, and to increase it in this country. The increase in the use of creosote prolonged the life, and so somewhat reduced consumption. In this country we had less area under forest in proportion to our size than any other country in Europe except Portugal, and our timber imports were, in weight, more than half the total timber imports of the timber-importing countries of Europe. In Europe there were only five countries which exported timber—Russia, Sweden, Austria-Hungary, Norway and Roumania—and the amount exported by these five countries was nearly 2,750,000 tons short of the total amount required in Europe. Germany, with 26 per cent. of its area under forest, and that admirably managed on scientific principles, against our 4 per cent., imported nearly half as much as we do. France, too, with 18 per cent. of its area under forest, and that scientifically managed, as in Germany, imported 1,250,000 tons of timber a year. Belgium, with 17 per cent. under forest, imported still more largely in value, though somewhat less in weight. Denmark, Italy, Spain, Holland, all import. Of the timber imported into this country in 1899 more than nine-tenths in weight and nearly four-fifths in value was coniferous wood, which was grown in the temperate countries of the Northern hemisphere, and this was the timber which was most largely consumed in engineering work. As Europe could not supply its own wants, our only other source was Canada, on which the United States was making increasing demands for timber, and Canada itself, with its enormous resources in water-power, would soon be a large consumer of its own forest produce. In this country forestry was neglected. Germany and France had long applied science to the growing of timber, and to them we had to go to learn. Belgium had done likewise. Even Spain, which had suffered more than any country in Europe from the destruction of forests, had a Government Forest Department. Russia, Sweden and Austria-Hungary looked after their forests. Denmark did much, Norway something, but not enough. As recently as 1890 the Chief of the Forestry Division of the United States Agricultural Department said that the United States was the most backward of all civilised nations in recognising the necessity of action with regard to forest resources. Happily a change had taken place in the last ten years in the United States, and Great Britain might now be regarded as the most backward of all civilised nations "in recognising the necessity of action with regard to forest resources." It was to be hoped that the labours of the committee now sitting, which was appointed by the Board of Agriculture this year to inquire into and report upon the present position and future prospects of forestry and the planting and management of woodlands in Great Britain, would result in steps being taken to remove this reproach. Dear timber would mean higher rents and higher wages to meet them. Why should we import nearly 100,000,000 cubic feet of timber in pit-props each year which we could grow ourselves? Prop-wood did not take three or four generations to grow, like sawyers' wood. The railway companies were partly to blame. They did little to help the buyers of home-grown timber, who had already begun to carry what they buy by steam traction on roads in consequence. The railway companies took thousands of tons of unpaying deadweight from all parts of the country back to the collieries each year in the shape of empty coal waggons, many of which might go back loaded with home-grown pit-props if the companies would seek to encourage such traffic.

A vote of thanks was accorded the President for his address.

### GENERAL.

**Professor Hilprecht**, the head of the archaeological department of the University of Pennsylvania, states that the Sultan, in recognition of the services rendered by him to the Imperial Museum at Constantinople, has presented him with the richest collection of Babylonian antiquities in the world. Professor Hilprecht has placed it in the University Museum. He considers the collection superior to that in the British Museum.

**The Glasgow Exhibition Executive** have published a statement as to the surplus from the recent exhibition. According to it there is 32,000*l.* on deposit in the bank, while a considerable sum, probably 15,000*l.*, is expected to be

realised from the sale of old materials. The surplus from the previous Glasgow exhibition amounted to 55,000*l.*

**The Broderers' Company's** forthcoming exhibition will consist of three classes of exhibits, and in each class seven prizes ranging from 2*l.* to 5*l.* 5*s.* are offered. The value of each exhibit must not be less than five guineas. About 360 exhibitors have entered for the various classes, while the exhibits number 533 pieces.

**The Monument** of the late Prince Christian Victor, by M. Emile Fuchs, intended for St. George's Chapel, Windsor, is being exhibited, by permission of the King, at the Grafton Galleries, together with other works.

**A Loan Exhibition** of pictures is to be held in the Art Gallery at the Guildhall, London, next spring. The Corporation will allow for expenses a sum not exceeding 500*l.*, exclusive of insurance.

**The Cape House of Assembly** have passed a vote of 20,000*l.* towards the erection in London of a national memorial to the late Queen Victoria.

**Wrexham Parish Church** has been restored at a cost of 10,000*l.* The north porch has been restored solely by members of Yale University, in memory of the founder, whose body lies close by. The new west porch doors, a memorial to the late Duke of Westminster, whose gift of 2,000*l.* enabled the work of reparation to be begun, were dedicated.

**A Memorial** will shortly be erected within the precincts of Guy's Hospital to the memory of those Guy's men whose lives were lost in the service of their country during the South African war. The memorial will take the form of a drinking-fountain to be placed in the colonnade, and a suitable design by Mr. Frederick Wheeler, F.R.I.B.A., has been selected.

**The Society for the Promotion of Hellenic Studies** held their first general meeting on Tuesday last, when a paper was read on "The Natural Basis of Form in Greek Art, with especial Reference to the Pantheon," by Mr. Gay Hambidge.

**A Meeting** of the Council of the National Trust for Places of Historic Interest or Natural Beauty was held at Westminster last week, Sir Robert Hunter presiding. Princess Louise, Duchess of Argyll, was elected president of the Trust, in succession to the late Lord Duferin, her Royal Highness having consented to accept the post. Lord Carlisle was (subject to his consent) elected vice-president. The date of the annual general meeting of the Trust was fixed for Monday, November 17.

**A Strike** of bricklayers in the Kidderminster district, which began in April, has been ended by an award given by his Honour Judge Austin, of Bristol, who was appointed arbitrator by the Board of Trade. He has decided in favour of the men, giving them a halfpenny per hour advance, and also certain concessions on other points.

**The Court of Common Council** have rejected a recommendation that the Corporation should acquire and take over the management of about 802 acres of land formerly forming part of Hainault Forest, and provide 10,000*l.* towards the purchase money.

**St. Ann's Church**, Bishop Auckland, has been considerably embellished. The north and south walls of the chancel have been furnished with handsome side screens, enriched by carved tracery spandrels and open cresting. The latter work is set off by the addition of an elaborate richly carved reredos, and includes four canopies. The architects were Messrs. Hicks & Charlesworth, of Newcastle, and the builders Messrs. Mowbray & Son, of Reform Place, Durham.

**The Northern Architectural Association** will hold the opening meeting on Wednesday next, when Mr. F. Caws will deliver his presidential address. Papers will be read during the session by Mr. F. Baker, Mr. R. G. Hatton, Mr. H. Cayley, Mr. R. Hedley, Mr. A. Greenwell and Mr. R. P. S. Twizell.

**Cabot's Quilt** for insulating and deafening purposes, referred to in Professor Norton's report, published last week, is sold in this country by the B. & S. Folding Gate Company, as will be evident from our advertisement pages.

**Mr. Halsey Ricardo** will read a paper on "The Revival of Gothic Architecture" before the Manchester Society of Architects on Thursday, the 13th inst.

**The Opening Meeting** of the Leeds and Yorkshire Architectural Society was held last evening at the Queen's Hotel, Leeds, when Mr. Butler Wilson delivered an address.

**The Sites Committee** of the Lancashire Asylums Board have issued a report re the new asylum for Lancashire. They recommend the purchase of Whalley Abbey farm estate, Whalley, containing 233 acres of land, for 25,630*l.*, and also of 68½ acres of adjoining land for 6,000*l.* The committee state that as there is no asylum in East Lancashire they have always been desirous of obtaining an estate in that part of the county, and strongly recommend the purchases named, subject to the approval of the Lunacy Commissioners and satisfactory arrangements being made with the Blackburn Corporation for a water supply. The Board are to consider the recommendations to-day (Friday).

## EDITORIAL NOTICES.

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**ASHTON-IN-MAKERFIELD.**—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. Architect whose plans are accepted and approved will be employed by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

**CAPE TOWN.**—Jan. 31.—The Council of the University of Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

**ECCELES.**—Dec. 12.—Plans are invited for the laying-out of an area of land and for erection of dwellings for the working-class on part of such area. Premiums of 50*l.*, 30*l.* and 15*l.* will be awarded in respect of the plans placed first, second and third in order of merit. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

**DURBAN (NATAL).**—Dec. 18.—Designs are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

**HOLYHEAD.**—Dec. 2.—Sketch designs are invited for schools and a teacher's house. The competitor whose designs and terms are approved and accepted by the Board will be appointed the architect. Mr. R. E. Pritchard, clerk, Holyhead.

**HULL.**—Jan. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

**ILKESTON.**—Nov. 28.—Competitive plans for a mixed junior school to be erected in Bennerley Street are invited. Particulars may be obtained from Mr. Wright Lissett, Town Hall, Ilkeston.

## CONTRACTS OPEN.

hat of the power-house for the Kirkcaldy Corporation, being Mr. C. Stanley Peach, of 28 Victoria Street, S.W.

THE vicar, wardens, sidesmen and inhabitants of Askrigg, North Yorks, having decided to erect a first-class public clock in the tower of their parish church to commemorate the Coronation, the order was placed with Messrs. W. Potts & Sons, clock manufacturers, of Leeds and Newcastle-on-Tyne, and the work was dedicated on the 30th ult., Mr. Lodge, one of the churchwardens, setting the clock in motion at 7 P.M.

## CORRESPONDENCE.

### London Miniature Bisley, 1903.

SIR,—The keen interest which recent events have created in rifle shooting and the impetus which has consequently been given to the formation of rifle clubs throughout the country are facts with which you are doubtless familiar.

Owing largely to the difficulty of obtaining long ranges civilians have been compelled to resort to the use of miniature weapons and ranges, and so accustom themselves to, and perfect themselves in, this description of shooting. In order to encourage this departure and stimulate greater enthusiasm in rifle shooting generally the executives of the Society of Working Men's Rifle Clubs and the British Rifle League have appointed a committee to arrange for the holding of what may be called a miniature "Bisley" at the Crystal Palace, London, S.E., in March next, and the following rules and regulations have been provisionally decided upon:—

1. That the competition shall be open to all civilian and Volunteer riflemen, whether members of a rifle club or not.
2. That as it is not intended to make a profit out of the meeting, the entrance fees for the various events shall be nominal.
3. That miniature and other rifle clubs may send as many representatives as they please.
4. That there shall be no restrictions as to the general use of weapons, any rifle using Morris tube or other miniature ammunition being eligible.

The length of range will be 25 yards in each event, and stationary, moving and disappearing targets will be used, and various novel conditions introduced, bearing as much as possible on minor but important lessons derived from the late war.

Several valuable trophies have already been offered, includ-

ing the Society's trophy, the Gamage 100-guinea shield, the Sandow 40-guinea bowl, the "Regiment" cup, Messrs. Buck & Co.'s cup, Messrs. Paterson's trophy, and numerous gold, silver and bronze medals.

The value of the miniature rifle as a means to training has been so frequently demonstrated that we hope this effort to bring its uses and advantages more prominently before riflemen in all sections of the community will receive your sympathetic support.

All communications respecting the meeting should be addressed to the Joint Secretaries, "London Miniature Bisley, 1903," 17 Victoria Street, Westminster.—I am, dear sir, yours obediently,

FRED LANCE, Lieut.-General,

Acting chairman of the committee,  
Society of Working-men's Rifle Clubs.

## ELECTRIC NOTES.

At a special meeting of the Irvine Town Council, it was resolved to apply for a provisional order to supply electricity in the burgh and to acquire property and execute the works necessary for carrying-out this purpose.

At a meeting of the Malvern District Council, Mr. F. A. Moerschell (chairman of the lighting committee) stated that tenders had been received for the various things required in connection with the supply of electric light in the district. He was pleased to inform the Council that the amounts were such that the total cost of the undertaking would be something like 14,000*l.* instead of 17,000*l.*, the original estimate.

## NEW HIGHER ELEMENTARY SCHOOL, FINCHLEY.

In response to an invitation issued by the Finchley School Board, eleven selected architects submitted designs for the Higher Elementary School proposed to be built by the Board. Mr. Thomas E. Collcutt, F.R.I.B.A., the assessor, having made his award, the sealed letters accompanying the plans were opened, when it was seen that the first premium had been awarded to Mr. W. G. Wilson, A.R.I.B.A., Bloomsbury Mansion, Hart Street, W.C.; the second to Mr. G. E. T. Lawrence, A.R.I.B.A., Chandos Chambers, Strand, W.C.; and the third to Messrs. Mitchell & Butler, 16 Finsbury Circus, E.C. In terms of the conditions issued to the competitors the Board have instructed Mr. Wilson to proceed with the work.

## VARIETIES.

THE newly-built Congregational chapel at Stainton, near Dalton-in-Furness, has been opened.

WREXHAM parish church has just been restored at a cost of 10,000*l*.

THE Countess of Dudley has opened the new wing of the Cottage Home, Kingstown, which was designed by Mr. Kaye Parry, architect, and erected by Mr. Frazer, contractor, Bray.

THE new church of St. Mark's, Plumstead, was consecrated on the 1st inst. by the Bishop of Rochester. It has accommodation for 800, and has cost 6,200*l*.

THE contractors of the Simplon Tunnel have asked for the contract time to be extended by fourteen months owing to the unexpected difficulties met with in the work.

ST. PETER'S Church, Fairfield, Buxton, now enlarged by the addition of a north and south transept, nave, organ-chamber, vestry and chancel at a cost of 3,000*l*, has been consecrated by the Bishop of Southwell. There was an ancient chapel on the site in 1595. Towards the outlay 1,700*l*. has been raised. The Bishop gave 50*l*. and the collection realised 20*l*. Mr. Samuel Gratrix, of Manchester, was a donor of 200*l*.

ALBERBURY (Shropshire) Church was reopened on the 30th ult. after complete internal and external restoration. A fine old fourteenth-century oak roof, which had fallen much into decay, has been renovated, the organ has been enlarged, and the stonework of the edifice both outside and inside has been put into good repair. The total cost has been 870*l*. The architect is Mr. A. E. Lloyd Oswell, of Shrewsbury.

THE hospital at Darnley has just been considerably enlarged by the district committee of Upper Renfrewshire and the burghs of Barrhead and Pollokshaws, who are the joint proprietors. To the administrative block there has been added a board-room, matron's parlour, five nurses' bedrooms and waiting-room. A new pavilion, containing four wards with twenty beds, has also been built. Various improvements have been made on the old pavilions, and the total cost is estimated at about 6,500*l*.

THE Bishop of Colchester has dedicated the nave of a new church which has been erected to serve the Bernard's Heath district of St. Albans, and as the headquarters of the St. Albans Diocesan Mission. Seven years ago on Saturday the chancel portion was dedicated, and an iron building attached was used as a nave. Recently Mr. F. Taylor, of Bucknalls, near

St. Albans, offered 5,000*l*. to build the nave and thus complete the church, and the offer having been accepted, work was at once commenced. Various other sums were raised, and the chancel was embellished with carved clergy and choir stalls.

THE new tower and bells of the Leamington parish church were dedicated on the 30th ult. by the Bishop of Worcester. The erection of the tower marks what is practically the last stage of the important scheme by which the church—planned fifty years ago on ambitious lines, but for a long period left in an incomplete condition—has become one of the handsomest churches in the county. The height of the new tower to the top of the pinnacles is 140 feet. In it have been rehung the bells which have been silent since the wooden belfry from which they were for a long time rung was condemned as unsafe and taken down, and the original peal of six has now been increased to the full octave. The architectural style of the new tower is Perpendicular. The entire work has been carried out by Messrs. G. F. Smith & Sons, under the supervision of the architects, Sir Arthur Blomfield & Sons.

AT the Carpenters' Hall, London Wall, under the presidency of Sir James Crichton-Browne, the Sanitary Inspectors' Association met together on the 1st inst. for the purpose of receiving the address of the chairman for the ensuing year, Mr. Young. The latter reminded his hearers that it was upon the faithful and intelligent discharge of their duties that the health of the community depended. He urged that as those duties had in the past been performed with signal advantage to the public, the sanitary inspectors were entitled to the like security of tenure of office as enjoyed by their co-workers in public health in the Metropolis, the medical officers of health. Looking back through the nineteen years that the Association had existed, he said that two questions had always been consistently advocated, viz. that an inspector should have had a practical training for his work, and that he should have passed a qualifying examination. Personally he was always in favour of having their various societies united in one strong body, and he was always ready to make any personal sacrifice to bring such a desirable object about.

THE new nurses' home, which has just been completed, adjoining the Wednesbury Road, Walsall, and within the grounds of the District Hospital, was opened on the 30th ult. by the mayor (Councillor W. J. Pearman-Smith). The new building, which has been designed and carried out under the

Made in any Tint or Colour required, or may be Tinted with Tube Colour Stainers.

MANUFACTURED BY

## ASPINALL'S ENAMEL, Ltd. New Cross, London, S.E.

supervision of Messrs. Bailey & McConnal, is of red brick, with terra-cotta dressings. It is in Queen Anne style, and will be a decided acquisition to this part of the town. The builder is Mr. Mallin, of West Bromwich, and the structure is a credit like to the architects and the contractor. The basement, just above the level of the Wednesbury Road, is to be used as a department for out-patients, the number of whom has grown so rapidly of late years, whilst the rest of the building, the next floor of which is on a level with the high ground behind, is to be devoted entirely to the use of the nurses, who will be able to walk straight into the day-rooms from the hospital without any climbing of stairs. There are no fewer than twenty-three bedrooms, in addition to sitting-rooms and every convenience that sanitary science can devise. The cost of the building has been 6,116*l.*, and adding for furnishing 420*l.*, the total expenditure has been 6,536*l.*

## BUILDING AND BUILDERS.

THE foundation-stone has been laid of the new church of St. Silas, Ivy Hill Road, Nunhead. The church, when complete, will afford seating accommodation for 700 persons.

WORK has been commenced on the new lighthouse at the end of the pier extension, Folkestone. It will be a splendid structure, built from Cornish granite.

THE Bridgewater Trustees are now extending the picturesque black and white courthouse in the centre of the village of Worsley by adding another wing to it, the accommodation having become inadequate.

THE contract for the new Primitive Methodist school at Lightbourne, Moston, Lancs, has been let for the sum of 1,400*l.* It is seven years since the Primitive Methodist body erected an iron structure in this particular district, but in consequence of the great increase of the population the building has become too small. Already there are 300 children in regular attendance.

A STEEPLEJACK named John Gouldie met with a serious accident at the furnaces, Clyde Ironworks, where he was employed. Gouldie was in the act of putting hoops round the furnaces at a considerable height, and was standing on a gas pipe 4 feet in diameter, when he slipped and fell 25 feet, fracturing three ribs and otherwise sustaining severe bruises. He was taken to the Royal Infirmary.

At a special meeting of the Brigg Urban District Council to consider the proposed town drainage scheme, it was stated that tenders had been received to carry it through at a cost of 6,000*l.* to 9,000*l.* This exceeded the amount the Council were authorised to borrow, and it was decided to proceed with part only of the scheme, including the outfall works, pumping station and the drainage of the Grammar School Road and Glebe Road. It was also decided to ask the contractors to give separate tenders for this portion.

THE Stockport Guardians have decided to ask the Local Government Board to sanction a loan of 50,000*l.* for a new infirmary. The infirmary is to be erected on a site secured at Stepping Hill on the adopted plans of Mr. W. H. Ward. Provision is made for fifty-eight beds and an administration block. Canon Moloney, the chairman of the new infirmary committee, stated that about 39,000*l.* would be borrowed on a thirty years' loan. The estimate included site for boundary walls, road-making and teaching apparatus.

At a meeting of the Port Glasgow Town Council, Provost M'Master presiding, the town clerk submitted a draft of the improvement scheme under the Housing of the Working Classes Act 1890, as revised by Parliamentary agents. The estimated cost of the scheme, as prepared by Mr. Robert A. Bryden, Glasgow, is 29,200*l.* The Provost moved and Bailie Buchanan seconded that they approve the scheme. This was unanimously agreed to. The foregoing amount includes the sum of 10,000*l.* given by Mr. W. T. Lithgow, shipbuilder, towards the scheme.

At the monthly meeting of the Whitby Urban Council on Tuesday night it was decided to invite Messrs. J. H. Harrowing and W. H. S. Pyman, the local representatives on the North Riding County Council, to attend the next meeting of the highways and sanitary committee of the Whitby Council, with a view to giving the Council such information as might lead to a satisfactory decision upon the new bridge scheme when that matter next comes up for consideration by the bridges committee of the County Council.

THE engineer of the Walthamstow District Council is preparing plans for artisan dwellings which could be erected on the basis that the rents would be from 5*s.* 6*d.* to 7*s.* 6*d.* per week. The price of the land is reckoned at 500*l.* an acre, and the time for the repayment of the loan forty years at 3 per cent. interest. The Council has decided to borrow 100,000*l.* from the Public Works Loan Board at 3½ per cent. interest, repay-

able within thirty years, for the purpose of advances under the Small Dwellings Acquisition Act, 1899. Several applications from working men for loans have been received.

A LOCAL GOVERNMENT BOARD inquiry was conducted by Colonel W. R. Slack, R.E., recently into the modified scheme for the provision of a highways depôt at Cheston Road, Aston. Two years ago the Aston District Council obtained powers for borrowing 12,690*l.* for this purpose, but as the result of the sale of a portion of land and the adoption of a less pretentious scheme, they now came forward with a request for borrowing powers for 7,634*l.*, in substitution for the larger sum. The facts of the position were explained to the inspector by Mr. Joseph Ansell (clerk), who stated that the original scheme sanctioned the construction of fifteen cottages fronting Cheston Road, intended to be used for the employés of the Council. Generally, all the arrangements contemplated by the first scheme were larger and more expensive than that suggested by the revised proposals. When the Council came to deliberate on the question they arrived at the conclusion that it would be unwise to spend large sums of money in the erection of these cottages, which ultimately would have to be let at such a sum as would involve an expense upon the rates, and that this would be better left to private enterprise. Thus, instead of spending 3,200*l.* on the cottages, the Council were spending 715*l.* on a foreman's house and the horsekeeper's cottage. The

original site was 12,000 square yards in extent, but finding that they could do with less area the Council sold 3,000 square yards and 980 yards frontage to the Electric Ordnance Accessories Company. Altogether, said Mr. Ansell, there was a saving of 5,000*l.* on the buildings, in addition to which the sale of the land realised 3,383*l.* Mr. Ansell remarked that in his long experience the application for a reduced sum was unique. Colonel Slack: It is my first experience of this kind of thing. It is generally the other way about—authorities asking for more. Mr. Ansell remarked that at a time when so much was being said about municipal socialism Aston took a little credit to itself for having done what they thought was the right thing in the interests of the ratepayers, and saved a very considerable sum. Subsequently Colonel Slack visited the site of the proposed depôt.

## A NEW PROCESS FOR MAKING STOCK BRICKS.

ON Tuesday last, on the invitation of Messrs. Eastwood & Co., Ltd., of Belvedere Road, Lambeth, a party numbering about 200 architects, surveyors, builders and other experts in and users of bricks proceeded by special train to Sittingbourne to inspect the practical working of an invention which promises to revolutionise the manufacture of stock bricks.

Arrived at Sittingbourne, or rather Teynham, which is the station beyond, the party first visited Messrs. Eastwood's works in the station-field, where brickmaking on the old plan was going on. Here conveyances were waiting in which visitors were driven to Conyer, where the new plant has been installed.

The new system is the invention of Messrs. Möller & Pfeifer, of Berlin, with whom Messrs. Eastwood & Co., Ltd., have entered into a contract whereby they obtain on terms the sole right to use their dryers and kilns within a radius of 80 miles from Charing Cross. They have also undertaken the agency outside this area for the whole of Great Britain and Ireland. It will readily be conceded that a process which insures rapidity and perfection of manufacture, which, of course, also means reduction of cost, would be welcomed by a firm whose output of bricks last year amounted to upwards of 120,000,000, and such a process they certainly seem to have found in the one under discussion, as by its means four days suffices for the whole process of manufacture from the filling of the mould to the issue from the kiln of a perfectly formed, thoroughly burnt stock brick. There is practically no waste, as the proportion of stocks per burning

averages 85 per cent., and when some trifling modifications in the system have been made it is expected to attain to as high as 97 per cent., against the 50 per cent. average under the old-fashioned method, while as the whole process from start to finish is carried out under cover it is entirely independent of the weather conditions, which have hitherto been an important consideration in brickmaking. The process in question is briefly as follows:—

The moulds, in sets of six, are filled and pressed by machinery and delivered to attendants, who place the bricks on specially constructed trucks, each holding 240 bricks. The trucks, when filled, are taken into the drying shed, which is heated by exhaust steam. Here, still on the trucks, the bricks remain for twenty-four hours, at the end of which time they are thoroughly dry and ready to be taken on the same trucks to the mouth of the kiln, where they are loaded on to a kind of waggon which fits, and, in fact, forms part of the bottom of the kiln, into which, when loaded, it is pushed, and by its entry forces out at the other end of the kiln—which, by the way, is 180 feet in length—a similar carriage with its complement of bricks, which, having been in the kiln for three days, are now thoroughly burnt as above mentioned. As Messrs. Eastwood & Co. explained, the present installation was made for purely experimental purposes, but they are so satisfied with the results that a considerable and speedy augmentation of the plant is in contemplation.

### LIVERPOOL ENGINEERING SOCIETY.

THE first meeting of the twenty-ninth session of the Liverpool Engineering Society, which was held on Wednesday evening at the Royal Institution, was attended by a representative gathering of members. Mr. Ernest S. Wilcox, M.Inst.C.E., the newly-elected president, delivered his inaugural address, dealing principally with a review of the major steps in the progress of engineering works which had been carried out in the port and city of Liverpool since the formation of the Society in 1875. In regard to the port, he gave an interesting account of the work of dock construction and improvement during the past twenty-seven years, and also of the dredging operations which had resulted in the removal of the bar formerly existing in the river. Beginning in 1890, he said, this latter work had been ceaselessly carried on ever since, resulting up to July 1 of this year in the removal of 27,866,590 tons of sand from the bar

and 34,800,930 tons from the Queen's and Crosby channels, and giving a depth of water on the bar, at low water of spring tides, of about 27 feet for a width, he believed, of about 1,500 feet. And what had resulted from that could not be estimated in value to the port and city. The lengthening of the landing-stage, building of the river-side station, bringing of the largest vessels alongside the stage, and the despatch of all their passenger and mail business there with the least possible delay, had all combined to emphasise the commanding position that the port of Liverpool held, and the fact that the ratepaying tonnage had increased to 6,763,768, 8,421,339 and 10,021,725 in the years ending July 1, 1880, 1890 and 1900 respectively, showed that it was one from which there could be no fear that she would be deposed. For the work went on, the energies of those in authority were apparently inexhaustible, and the engineering spirit which had so distinguished the dock estate for many years past was unabated. Dealing with the chief works accomplished in the city during the period under review, the President referred to the laying of roadways and streets, the initiation of the tramway systems, the Vyrnwy Waterworks, and the large reconstruction of sewers that had been carried out in recent years. Alluding to railway progress in the city and port, he traced the history of the improvements and extensions effected by the various companies, and made special reference to the Mersey Tunnel Railway and the Liverpool Overhead Railway. Both of these, he remarked, were making fresh bids for popular support, and they hoped that the pluck and perseverance shown in each case might result in the attainment of a fair and proper return on the outlay.

On the motion of Mr. J. A. F. Aspinall, seconded by Professor Hele-Shaw, a hearty vote of thanks was accorded the President for his address, after which the proceedings terminated.

### RICHMOND ASYLUM, DUBLIN.

AN inquiry was held by Mr. P. C. Cowan, chief engineering inspector to the Local Government Board, at the Richmond Lunatic Asylum on Monday, with reference to the application of the joint committee for the sanction of a loan of 39,270*l.* for the purpose of completing the building of the auxiliary premises at Portrane.

Dr. Conolly Norman, medical superintendent, examined, gave details of the various loans obtained from the Board of Works for the equipment of the Portrane Asylum. The loans obtained were in almost all cases insufficient to meet the outlay. The first loan was one of 19,308*l.* 3*s.* 9*d.* for the purchase of the ground—470 acres—and of this sum 4,620*l.* was standing to their credit. In 1896 they obtained a loan of 208,300*l.* for the heating, erection, &c., of the building. All this money was expended, and it was expected that an additional sum of 1,200*l.* would be required. The electric lighting, laundry, plant, &c., cost 11,700*l.*, and this loan was all expended. The cost of the buildings altogether, including the water supply, would be 356,000*l.*. He was of opinion that the sum of 313,860*l.* would be sufficient to complete the buildings, but, roundly speaking, in order to have a contingent sum, 356,000*l.* would be the sum necessary. The accommodation at Portrane was for 1,200 permanent patients, and for 400 temporary patients, and the total cost for the 1,600 patients would be 270*l.* per head, including the water supply.

Mr. Dillon: You have made some comparisons with English and Scotch institutions?—Yes. In Scotland, in the Lanark Asylum, the cost was 445*l.* per bed, and the number of patients between 600 and 900; at Glasgow the cost was 421*l.* per bed for 613 patients; at Govan 481*l.* per bed for 520 patients. In England the figures were—Cheddleston, 428*l.* for 618 patients; in Claverley, 284*l.* for 2,050 patients; in Middlesex County, 311*l.* per head for buildings alone.

To Mr. Cowan: The cost in Portrane was 52*l.* per bed for temporary and 270*l.* for permanent patients, including water supply.

Mr. Dillon: That shows that the cost here contrasts favourably with that applicable to other places?—Yes, that is unquestionably the fact. They were overcrowded by three or four hundred. There were in the prison about 100 women, and they had had as many as 400.

You would like to get out of the Richmond Lunatic Asylum 400 patients and to get rid of the prison?—Even that would be a temporary expedient.

You would soon have your Richmond and Portrane Asylums filled?—We might, perhaps, have temporary accommodation for 400 more. The prison was very gloomy, the rooms were small and supervision was difficult, especially for administrative purposes. The accommodation in Richmond Asylum and Grangegorman was 1,600. The same amount of accommodation was provided at Portrane. At the present rate of in-

crease there would not be a bed to spare in a few years. They could accommodate 1,200 patients in the Richmond, 400 in Grangegorman, 1,200 in the permanent building and 400 in the temporary building at Portrane. There were at present altogether 2,600 patients in the asylum.

To Mr. Shannon: The cost of the site at Portrane was about 10,000*l.*, with about 800*l.* for costs. A comparison with the cost in Scotland was not unfavourable to Portrane.

Mr. J. J. Doyle, accountant, handed in a statement showing the financial position of the asylum committee on taking over the Institution, from which it appeared that the Board of Control had provided a much less sum than was necessary to meet works for which contracts had been placed. The chief items were—heating and ventilation, contract 15,830*l.*, actual cost of work 16,943*l.*, amount provided, 7,000*l.*; plumbing and fire mains, contract 7,589*l.*, actual cost 9,353*l.*, amount provided, nil; drainage and rain-water tanks, contract 7,400*l.*, actual cost 9,500*l.*, amount provided 5,000*l.*; water supply, actual cost 13,468*l.*, amount provided 6,750*l.*; electric light, laundry and kitchen, contract 15,405*l.*, actual cost, 16,448*l.*, amount provided, 11,700*l.*. No provision whatever had been made for extras on building contract, or for minor works, roads, furnishing and equipment, which amounted to a very large sum. Of the total cost of 279*l.* per bed in Portrane in permanent buildings, 24*l.* was chargeable to water supply, while the corresponding figures in Scotch and English asylums were as follows:—Lanark, 445*l.*; Glasgow, 421*l.*; Govan, 481*l.*; Chichester, 328*l.*; Cheddleston, 428*l.*; Claybury, 284*l.*. The last-named asylum has 2,050 patients, while Portrane has only 1,200, and, of course, the higher the number of patients the lower the average cost per bed. The cost per bed in temporary buildings in Manor Asylum, London County, was 170*l.*, while in Portrane it was only 52*l.*

Mr. Dillon, solicitor, said the figures were important, in view of the charges of extravagance which had been made against the Portrane Joint Committee.

Mr. Shannon, solicitor, said the rate for lunatic asylums had gone up from 2*d.* to 5½*d.* in the pound in Dublin within the last five years, and the feeling of the ratepayers was that any work which was not absolutely necessary should not be undertaken at present, and that as much as possible should be done by patients' labour.

Other evidence having been given,

The Inspector said that he would make his report to the Local Government Board in due course.

**WALSALL SEWERAGE SCHEME.**

A PUBLIC inquiry on behalf of the Local Government Board was held on the 29th ult. at the Guildhall by Colonel W. R. Slacke, R.E. (Government inspector), relative to an application by the Walsall Town Council for powers to borrow 2,250*l.* for experimental works of sewage disposal at the Brockhurst Sewage Farm, the Delves (in the borough of Wednesbury). The Corporation was represented by Mr. J. R. Cooper, town clerk, and Mr. R. Middleton, borough surveyor, and there were also present, Councillor J. Noake, the mayor-elect (chairman of the sewage-farm committee), Councillor J. H. Roberts (vice-chairman), Alderman Clare and Councillors S. Drew, S. J. Hawley, R. C. Thomas, E. H. Ingram.

In the first place the Inspector asked if there was any opposition; but there was no response, and the town clerk remarked that the Corporation did not know of any.

The Town Clerk, in opening the case for the Corporation, said that since 1891 the population of Walsall had increased at the rate of 20 per cent. There had been no extension of the borough for twelve years. The area was 17,358 acres, and the rateable value 272,145*l.* for the purposes of the poor rate, and the assessable value for district rate was 219,535*l.* The amount of outstanding loans and stock chargeable upon the district fund for sanitary purposes was 217,489*l.* 12*s.* 1*d.* The sewage farm was the freehold property of the Corporation, and comprised 175 acres. It was established in 1882. At that time the Corporation adopted a system of dealing with their sewage by broad irrigation. Within ten years it was found that the land had become very much choked up with sewage and was no longer efficiently purifying it. The result was that in 1892 the Corporation went to the Local Government Board and obtained sanction to a loan of 8,750*l.* for the purpose of putting down sewage purification works, tanks and such like plant, first of all to deal with the sewage by chemical precipitation and then irrigate the effluent over land. In connection with that scheme the Corporation put down certain filter beds of polarite. The scheme at first, he believed, contemplated eight beds. The Corporation found the cost of constructing these very much beyond what was estimated, and they decided, on the advice that was given them, to put down only two small beds. After a few years' experience it was found that as to these filter beds, although the effluent was of a satisfactory character, it was not of such a character as the Local Government Board would be agreeable

to being discharged into the river. The water in the river was worse than the sewage effluent discharged into it, owing to the very large quantity of trade refuse finding its way into the tributaries of the river in the different districts through which they passed. When the Local Government Board gave the sanction for the loan of 8,750*l.* they foresaw that possibly the effluent would not be of a satisfactory character, and they made it a condition that the Corporation should discharge any effluent over land, and they required an undertaking that that should be done. That undertaking was given honestly in the belief that the Corporation would be able to give effect to it. But it was found that to discharge the effluent from those two filter-beds would require the laying of a drain through practically the whole of the length of the farm to the furthest boundary, and the under-draining of a field for the purpose of dealing with the effluent. That field was undrained, and this state of things was found to exist: that when the river was in flood and the land was most needed for the purpose of dealing with the effluent the drains were waterlogged and became inoperative, and the Corporation thought they would not be justified in constructing a drain from the filter beds to this piece of land. Consequently they had not been able to give effect to that undertaking. Sanitary science had been taking very great strides, and the Local Government Board themselves had advanced in their views as to what should be done with the effluents from sewage farms. He believed in certain cases they had listened to an effluent being turned into a river without being treated over land. Having to face the difficulty and deal with the increased volume of sewage which was being discharged at Brockhurst Farm, they applied themselves to considering what would be the best method of dealing with it. Within the borough boundary there was an outlying district, practically a separate town, called Bloxwich, with a population of from 12,000 to 14,000. At the Beechdale Farm, which dealt with the sewage of the Bloxwich portion of the borough, they had constructed some experimental works for the purpose of testing the bacteria process. Between 1,200*l.* and 1,500*l.* was spent in putting down works, which had been in operation for some years with eminently satisfactory results. The sewage from Walsall, however, included a great deal of manufacturing refuse, spent acid and such like things, which came from small factories in small quantities, and the question had arisen whereby the filter beds would deal with the sewage from Walsall in the same efficient manner as with

## 'TAYLOR'S PATENT JUNCTION'

No. 12662.

**For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.****APPROVED BY ALL SANITARY AUTHORITIES.**

THIS Junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the many angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are dangerous and not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction, which is adapted to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this Junction, as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. A perfect Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, what is necessary is to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back the Lead Pipe  $\frac{1}{2}$  inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together and draw up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all that is required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left intact. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property and causing other inconvenience.

A—Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.

B—Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.

C—Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in.  $\times$   $\frac{1}{2}$  in. Invert Junction for Anti-siphon Pipes, &c.

D—Shows how to arrange for a small sized branch.

Made in Three Strengths—Ordinary Rain Water,  $\frac{3}{4}$  and  $\frac{1}{2}$  Metal.

PRICES AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

the sewage from Bloxwich. It had, therefore, been suggested by the borough surveyor that before going to an expenditure of something like 75,000*l.* in putting down a complete bacteriological system at the Brockhurst Farm, the Corporation should first put down experimental beds, which might eventually become part of the complete system. This was felt to be the prudent course to adopt. They believed there was no other course open to them but to take up a system of that kind, provided it worked satisfactorily, however costly it might be. Unfortunately there was no land in the immediate neighbourhood of the sewage farm which was suitable for dealing with the effluent from the sewage works, consequently the only thing they could do was to economise what land they had by putting down bacteria beds. They would still have something like 60 or 70 acres of land over which the effluent could be irrigated after it was discharged from the beds. The Corporation had spent about 65,000*l.* in capital outlay in trying to find a system which should efficiently purify the sewage.

The Town Clerk, replying to the Inspector, said the Corporation undoubtedly would carry out the complete system as soon as they were satisfied the experimental works were a success. The proposed new system would save 600*l.* or 700*l.* a year in chemicals alone.

The Borough Surveyor gave details of the works, and

The Inspector said it seemed very much as if additional land would be required.

The Borough Surveyor replied that there was no land in the immediate vicinity of the sewage farm which he could recommend the Corporation to acquire.

The Town Clerk added that the lower the Corporation went down the valley the nearer they would be getting to the residential districts in the neighbourhood of Birmingham.

### SOUTHAMPTON HARBOUR IMPROVEMENT.

At a meeting of the Southampton Harbour Board on Tuesday it was decided to promote a Bill in Parliament in the session of 1903 to borrow the sum of 100,000*l.* for the purpose of deepening the harbour channels and approaches to 35 feet at low-water spring tides. The harbour and railway authorities are working most cordially together to further the interests of Southampton in connection with pending developments in the Transatlantic traffic. At the conference held between the authorities a few days ago the directors of the railway company informed a

deputation from the harbour board that they had already given instructions for two deep-water berths of 35 feet at low-water ordinary spring tide and one berth of 32 feet to be provided at the old extension quay at the docks, and that the work would be carried out forthwith. The directors suggested that the financial requirements of the harbour board in respect of the deepening of the harbour channels should be met by the corporation agreeing to forego the one-fifth of the dues at present receivable by them, and that the dues on the shipping using the port should be increased. An increase of  $\frac{1}{4}$ d. a ton on the shipping would realise about sufficient, with the relinquishment of the one-fifth by the Corporation, to meet the annual charges on the expenditure. In addition to the dredging work necessary to be done within the immediate jurisdiction of the harbour board there is a considerable area to be cleared at Thorn Knoll, just outside the Southampton Water, in order to provide a deeper channel from Southampton to the sea. The estimated cost of this portion of the work is put down at 25,000*l.*, and of this sum the railway company has offered to contribute 12,500*l.* The importance of proceeding with the work without delay is fully realised in the port, for it is now known that the international mercantile marine intend to largely increase the amount of business done by the American Line steamers at Southampton, and a largely increased traffic is anticipated from various other sources. The recommendations of the committee were agreed to, but the subject of the one-fifth of the dues which it is proposed the town shall relinquish will in due course be considered by the borough council.

### THE BIRMINGHAM ASSOCIATION OF MECHANICAL ENGINEERS.

THE first meeting of this Association for the present session was held at the Grand Hotel on Saturday evening last, Mr. G. Conaty (president) in the chair. A paper was read by Mr. Hugo Gibson on "The Diesel Oil-Engine," which was illustrated by lantern views. Mr. Gibson, in commencing his paper, referred to the principles and methods of carrying out the utilisation of fuel as adopted by Herr Diesel, of Munich. The scientific principles were not new, he admitted, but in the application of these principles Herr Diesel had made a ladder wherewith to mount to the pinnacle of fame. After referring to the initial stages in the evolution of Herr Diesel's engine, the lecturer

enumerated the points which Herr Diesel had laid down for further procedure. The lecturer's information was taken from the Diesel engine installed by the Harrogate Corporation for the pumping of sewage, which he contended from figures submitted proved it to be a satisfactory and very economical working engine, more so than the majority of oil-engines, although the initial outlay might be more. This engine at Harrogate was, he thought, the only one of Herr Diesel's in Great Britain. The lecture, which was most interesting and instructive, was cordially received, and afterwards led to a well-maintained discussion, amongst which the following members and friends took part:—Messrs. Wright, Seaton, Robson, Sandwell, Hodgson, Batey, Talbot, Deakin and Richardson. After the lecturer had replied to the numerous points raised by the discussion, the evening was brought to a close by a unanimous vote of thanks to Mr. Gibson, proposed by the President, to which the lecturer suitably responded.

### BUILDING TRADES' EXCHANGE.

THE annual meeting of the Glasgow Building Trades' Exchange was held in the Exchange, Glasgow, on October 31, Colonel Bennett presiding. Mr. David Cook, writer, secretary, read the ninth annual report on the affairs of the Exchange. The accounts showed that there was a credit balance on the year's working of 17. os. 9d. While the Exchange was financially in quite a healthy condition, the report continued, a strong effort would require to be made to increase the income. Efforts should be directed towards endeavouring to increase the membership and to obtain a number of new exhibits for the ample-room. Towards the building fund of the new technical college the Exchange collected a sum of 653*l.* 3*s.* 6*d.* over and above the sums contributed by the hon. president and president, or, in all, a sum of 2,153*l.* 3*s.* 6*d.* In connection with the appointment of a commission to inquire into the housing question, the executive asked that Mr. James Goldie's name be added to the commission. This request was granted, and Mr. Goldie would keep the Exchange in touch with the inquiry. During the year a discussion was entered upon in Parliament with reference to a pernicious Bill prepared and brought in by Mr. Charles Dilke, artfully entitled "A Bill to Legalise the Peaceful Conduct of Trade Disputes," and in this connection

the executive caused their secretary to address a letter on the subject to most of the Scottish members of Parliament. The accounts were approved; Messrs. Paterson & Benzie, C.A., were appointed auditors, and a vote of thanks was passed to the chairman.

### VENTILATION OF FACTORIES.

THE first report of the departmental committee appointed to inquire into the ventilation of factories and workshops has been issued, with appendices, as a Blue-book. This states that the ordinary standard of cubic air space per person has been found to afford no sufficient guarantee of ventilation, and that a more reliable test would be by means of analysis of the carbonic acid in the air. The legal limit under the proposed test should be fixed lower than the ordinary working limit to allow for cases where the air has become temporarily vitiated. It is consequently recommended that, under the powers conferred by the Factory Act, 1901, such a standard of ventilation should be prescribed for all classes of factories and workshops not specially dealt with that the proportion of carbonic acid in the air at the breathing level shall not, except on foggy days, rise beyond 12 volumes of carbonic acid per 10,000 of air, except that when gas or oil is used for lighting the proportion shall not exceed 20 volumes after dark or before the first hour after daylight, the only exception to be where the extra carbonic acid is produced in other ways than by respiration or combustion, as in breweries, cotton-cloth factories with artificially humidified air having the option of coming under this operation. It is also recommended that inspectors of factories should inform employers of the results of official analyses, and that these proportions have been exceeded, and that no legal proceedings should be taken till, after a reasonable interval for remedying the defect, the proportion is found, on an average of two or more samples taken in different parts of the room, to be exceeded by one volume or more, and the employer is unable to show that he has taken measures reasonably calculated to secure the requisite ventilation. Arrangements are proposed to have the analysis of samples made for the Factory Department of the Home Office by a specially qualified person, and to supply inspectors, when desired, with a properly tested portable apparatus for estimating on the spot the proportion of carbonic acid in air.

**ADULT APPRENTICES.**

WE have already given an account of the treatment of a man aged twenty-five, who became an apprentice of Messrs. Wigg & Wright, builders, of Ipswich. Owing to the demand of the local society of operative stonemasons and others he was dismissed. He sought redress in the County Court, but the judge held there was no ground for action. The Divisional Court reversed that decision and ordered a new trial. The defendant society appealed, and judgment was given in the Court of Appeal on Tuesday.

The Master of the Rolls read the following judgment:— This is an appeal by the defendants from the decision of the Divisional Court ordering a new trial of a case decided by a County Court judge in favour of the defendants. There is a cross appeal by the plaintiff asking that this Court should give judgment for the plaintiff with damages. The Court below, while agreed that the decision was unsatisfactory, were divided as to the relief, Mr. Justice Darling and Mr. Justice Channell holding that there ought to be a new trial, while Lord Alverstone was of opinion that the plaintiff was entitled to judgment. The parties agreed before them and before us that if judgment were given for the plaintiff the Court should assess the damages. The facts are stated in the judgments as reported below, and I need do no more than summarise them for the purpose of this judgment. The claim was for 50% damages for wrongfully and maliciously inducing Messrs. Wigg & Wright to break their contract of apprenticeship with the plaintiff. The evidence for the plaintiff was that he had become bound by an indenture of apprenticeship to Messrs. Wigg & Wright, stonemasons, of Ipswich, whereby they undertook to teach him the trade of a mason, paying him wages of 15s. a week during a period of three years. Messrs. Wigg & Wright had in their capacity as masters agreed to certain working rules with the defendant society, one of which (6) was as follows:— "That boys entering the trade shall not work more than three months without being legally bound apprentice, and in no case to be more than sixteen years of age, except masons' sons and stepsons. Employers to have one apprentice to every four masons on an average." The plaintiff's father was a mason. The plaintiff was not a member of the society, and was twenty-five years of age when he entered into the indenture of apprenticeship. The defendant society in concert with the other defendants, on becoming aware that the plaintiff had been taken as an apprentice by Messrs. Wigg & Wright, took steps to enforce compliance by them with rule 6

as interpreted by the defendants by threatening in the language of their letter set out in Mr. Justice Darling's judgment:—"If the man in question (the plaintiff) starts working at the trade, we are bound to protest against you for introducing an individual not of the trade, and in accordance with our general rule we have empowered our members working for your firm to take prompt action in the matter. We regret the thing has occurred, but we feel that the blame does not rest on us in any way." This was in effect a threat that they would call out the workmen in Messrs. Wigg & Wright's employ, all of whom were members of the defendant society, and, as was explained by counsel, if so empowered, would be supported while off work out of the funds of the society. Messrs. Wigg & Wright disputed the construction placed by the defendants on rule 6, contending, and as I think rightly, that it did not extend to masons' sons. Feeling, however, that they could not resist the coercion brought to bear on them, they dismissed the plaintiff. It was not suggested before us that the acts complained of were not all done by the defendants in concert. The plaintiff has therefore lost the opportunity, which he was lawfully entitled to, of emerging from the position of a labourer at 15s. a week to that of a mason who may earn up to 35s., and he has brought his action accordingly. No evidence was called for the defendants and no proof given of assent by Messrs. Wigg & Wright to any rules other than those put in, of which rule 6 is one. On these facts the learned County Court judge held as follows:—"I hold that the facts as proved and admitted before me fall short of giving any ground of action against the defendants. The defendants seem to me to have acted bona fide in the best interests of the Society of Masons and not to have been in any way actuated by any improper motives. They gave a certain interpretation to rule 6 and acted upon it, and though their interpretation may or may not be correct, as it was honestly held, I do not consider they have acted improperly in their method of enforcing it." On these facts the case seems to me to be clear. The plaintiff was entitled to the benefit of the contract which he had made, and that benefit he would have continued to enjoy but for the intervention of the defendants. The object of the defendants' intervention was to deprive him of that benefit. The facts leave no room for doubt as to that. He was not a member of their society, and was under no obligation, legal or moral, to conform to their rules. In these circumstances they conspired to enforce by threats of a formidable character, which they had the means of carrying into effect, a breach by his employers

and instructors of the contract which the latter had with him; and the only justification they can suggest for this conduct is that Messrs. Wigg & Wright had come under an obligation to them, not perhaps legally enforceable, if not illegal, not to make such a contract as they had made with the plaintiff. But the justification to be of any avail must cover their whole conduct, the means they used as well as the end they had in view. As against Messrs. Wigg & Wright they had whatever rights within the law the rules assented to by Messrs. Wigg & Wright afforded them. But to combine to coerce them, by threats of the character I have described, to break their contract with the plaintiff was in my judgment an illegal act carried out by illegal means. They cannot be in a better position if the rules are unenforceable than they would have been had a breach of them given them a legal cause of action. But in such case how can they possibly justify taking the law into their own hands and compelling the opposing litigant by coercion to give effect to their view of a disputed obligation by breaking his contract with the plaintiff? Further, does not such conduct demonstrate that their object was to defeat the plaintiff's purpose of becoming a mason? Belief, however honest, that in what they did they were acting in the best interest of the Society of Masons could be no excuse for conspiring to deprive the plaintiff of the advantages of his contract. Persuasion by an individual for the purpose of depriving another person of the benefit of a contract, if it is effectual in bringing about a breach of the contract to the damage of the person, gives a cause of action ("Lumley v. Gye," 2 E. and B., 216); and a strong belief on the part of the persuader that he is acting for his own interests does not seem to me to improve his position in any respect. Still less can it do so when he does not confine himself to persuasion, but joins with others to enforce their common interests at the plaintiff's expense by coercion. "That a conspiracy to injure—an oppressive combination—differs widely from an invasion of civil rights by a single individual cannot be doubted" (see per Lord Macnaghten in *Quinn v. Leatham*, 1901, A.C., at p. 511, and per Lord Brampton in the same case, at p. 528, *et seq.*). It seems to me, therefore, that this case stands wholly outside the debateable ground traversed in the discussion of *Allen v. Flood* (1898, A.C., 1). The action of the defendants was as clearly malicious, or, if the phrase be preferred, "without just cause or excuse," as in *Lumley v. Gye*, which, as well as *Temperton v. Russell* (1893, 1 Q.B., 715), has been finally established in *Quinn v. Leatham* to be a binding

authority. "There are," says Lord Watson in *Allen v. Flood*, at p. 96, "in my opinion, two grounds only on which a person who procures the act of another can be made legally responsible for its consequences. In the first place, he will incur liability if he knowingly and for his own ends induces the other person to commit an actionable wrong. In the second place, when the act induced is within the right of the immediate actor, and is therefore not wrong as far as he is concerned, it may yet be to the detriment of a third party; and in that case the inducer may be held liable if he can be shown to have procured his object by the use of illegal means." This passage is approved by Lord Macnaghten and cited by him as embodying the opinion of the majority in that case. The present case inevitably falls under one or other of those propositions, and I think within both. The defendants did knowingly and for their own ends induce the commission of an actionable wrong, and they employed illegal means to bring it about. Such conduct would be actionable in an individual and incapable of justification *a fortiori* where the defendants acted in concert. These considerations seem to me to exclude from discussion in this case the illustrations given in argument of what might in given circumstances be "just cause," or, in other words, suffice to negative malice. There was no relation between the defendants and either of the parties in this case at all analogous to those existing in the instances put of father and child or doctor and patient, which I leave for solution when the case arises. The defendants have no higher immunity from legal obligations than any other members of the community, and if they have legal rights they can enforce them by legal means only. It is not at all necessary in this case to embark upon the question whether "without just cause" is a complete equivalent for what was meant in the common law by malice. I am inclined to think that, though in many cases adequate as a description, it is not coextensive with it, nor do I think that in civil actions any more than in criminal it will be possible to eliminate motives from the discussion. See the weighty observations of Lord Brampton on this point in *Quinn v. Leatham* at p. 524. It is, however, very desirable to guard against the notion that if the act done be illegal, "just cause" may still be averred to purge the wrong. For instance, where illegal means have been used to bring about the breach of a contract to the detriment of a party thereto, "just cause" cannot come into the discussion at all. The use of illegal means evidenced malice, and in this connection malice was not equivalent to "without just cause."

## NEW MODEL TYPEWRITER NEW MODEL

The "LIGHT-RUNNING YÖST," so termed because of the SMOOTHNESS, QUIETNESS and SWIFTNESS of its working, is the latest model of the well-known YÖST, famous for the clearness and neatness of its writing, consequent upon its types communicating direct with the paper. Many valuable improvements have been effected, and there are some features entirely new to writing machines.

The cause of intervention might be just, but the means used to enforce it might be illegal. The common law action threw the burden of proof on the plaintiff. It was not enough for him to show that the defendant had brought about the breach of a contract between a third party and the plaintiff. He had to show that it was done maliciously, and the burden of proving malice lay upon him. It was not a case of a *prima facie* cause of action based on the fact that a breach of contract had been brought about to the detriment of the plaintiff, party thereto, by a stranger to the contract. The common law did not lightly extend rights arising out of contracts to and against persons not parties thereto, owing to the absence of privity (see the cases collected in the notes to "Pasley v Freeman," 2 Smith's Leading Cases, 64). Some nexus had to be established between the plaintiff and the stranger, and this was found in malice. Unless the plaintiff could show this, he failed to bring the stranger into such relations with him as to ground a cause of action, and therefore the burden was upon the plaintiff to prove a cause of action, not upon the defendant to justify. I think some confusion has crept into the discussions on this matter through want of sufficient regard to these elementary points. I think the materials before us are sufficient to enable us to enter judgment, and I agree with the Lord Chief Justice that the defendants' appeal should be dismissed and the plaintiff's cross-appeal allowed, and judgment entered for the plaintiff for 50*l.* Judgment accordingly.

Lord Justice Stirling's judgment was as follows:—The evidence in this case establishes, in my opinion, that the defendants knowingly procured Messrs. Wigg & Wright to violate a contract which they had entered into with the plaintiff. In so doing the defendants acted without any improper motives; but I take the law to be as stated by Lord Macnaghten—"A violation of legal right committed knowingly is a cause of action, and . . . it is a violation of legal right to interfere with contractual relations recognised by law, if there be no sufficient justification for the interference." *Quinn v. Leatham* (1901, A.C., 495, at p. 510.) This proposition was not seriously questioned in argument, but it was contended on behalf of the defendants that there was a sufficient justification for their interference, because Messrs. Wigg & Wright had, previously to the contract with the plaintiff, entered into a contract with them, the defendants, which is said to be inconsistent with the contract between Messrs. Wigg & Wright and the plaintiff. Some difficulty appears to have arisen in the Divisional Court as to what the terms of this

contract were; but at the hearing before us counsel on both sides agreed and invited us to decide the case on the footing that the terms of this contract are contained in a printed document put in evidence which purports to be "working rules agreed to and signed by the employers and the operative stonemasons of Ipswich and district," and to have been signed by (amongst others) Wigg & Wright, as employers, and the president and other officers of the defendant society. It was contended in argument that this agreement was illegal as being in restraint of trade. As at present advised, I am not satisfied that this is so; but in the view which I take it is unnecessary to decide the point, and I shall assume for the purpose of the present judgment that the agreement between Wigg & Wright and the defendants was in all respects valid and binding. The particular clause relied on is rule 6:—"That boys entering the trade shall not work more than three months without being legally bound apprentice, and in no case to be more than sixteen years of age, except masons' sons and stepsons." This I refer to as the first part of the rule. It proceeds:—"Employers to have one apprentice to every four masons on an average." This I refer to as the second part of the rule. It is contended on behalf of the defendants that the first part of the rule prohibits employers from taking apprentices over 16 years of age, and if this were the true construction of the rule, and it were applicable to persons in the position of the plaintiff, there would be, to say the least, a serious question whether the justification set up by the defendants was not made out. But whatever the true construction of this part of the rule may be, it does not, in my opinion, apply to the plaintiff. He was a mason's son, and by the terms of this part of the rule masons' sons are exempted from the operation of this part of it. As regards the second part, it is not well expressed; but it may be read as prohibiting employers from having more than one apprentice to every four masons. If this be the true meaning, Wigg & Wright violated it. It is not every violation of these rules which would justify the defendants in what they did. It appears to be plain from the letter of May 22, 1901, that the defendants' ground of complaint against Wigg & Wright was not that they had two apprentices when they ought to have had only one, but that they had taken the plaintiff as an apprentice when his age was between 25 and 26. The objection that Messrs. Wigg & Wright had more than the proper number of apprentices might have been got over if they had entered into some arrangement by which the services of the other apprentice were transferred to another master. But the

letter shows plainly that the defendants would not have been satisfied so long as the plaintiff was allowed to work at the trade. I think that the object of the defendants, as shown by that letter, was to prevent Messrs. Wigg & Wright from giving the plaintiff the benefit of his contract with them, and I find nothing in the rules which entitled them to insist on that. It was said, however, that the defendants acted in good faith and honestly believed that the true construction of the rules was different from that which it appears to me to be. But, in the absence of fraud, good faith is not of itself a sufficient defence to an action founded on tort, though it may in some cases be an essential element of such a defence. If an action is brought for a trespass to land and the defendant justifies under an alleged right of way, judgment must go against him if he fails to establish the right, however honestly he may have believed in its existence. If an action is brought for the publication of a defamatory matter and the defendant sets up that it was published on a privileged occasion, he will fail in his defence unless the privilege is established, however clear his good faith may be. I do not think that the present defendants occupy a better position than a defendant setting up privilege in an action for libel or slander, and as they fail to establish the existence of the contract on which they rely, I think that they fail in their defence. I desire to express no opinion on the important question whether, if the contract had been such as they believed it to be, they would have been justified in point of law in doing what they did. For these reasons, which appear to agree in substance with those given by the Lord Chief Justice in the Divisional Court, I think that the decision of that Court should be varied and judgment entered for the plaintiff.

Lord Justice Cozens-Hardy said:—I agree. The judgment of the Master of the Rolls, which I have carefully read and considered, so completely expresses my own views that I do not desire to add a word.

### PROPOSED BRIDGE ACROSS THE STRAND.

At the meeting of the Westminster City Council on Thursday the works committee submitted a scheme by Sir John Wolfe-Barry for the construction of a bridge across the Strand at the bottom of Wellington Street, so as to enable the north and south traffic to pass independently of the east and west traffic. Several years ago Sir John Wolfe-Barry read a paper before

the Society of Arts, and at that time he found upon calculation that the average delay of traffic in the Strand amounted to from 10 per cent to 45 per cent., that was to say, a conveyance proceeding towards the City, instead of taking 20 minutes, took 30 minutes during the worst period of the day. He explained to the committee that the traffic had greatly increased since that time, and when the new main thoroughfare connecting Holborn with the Strand was completed, that improvement would have the effect of still further increasing the block at the meeting-point of the two streams of traffic. Sir John Wolfe-Barry's solution of the problem is to make a street adjoining Wellington Street on its western side, starting from Tavistock Street, which would rise from that point to a gradient of about 1 in 30, to construct a bridge across the Strand with a headway of about 16 feet 6 inches, and to continue the roadway on the line of Lancaster Place, which should fall at a gradient of about 1 in 20 to 1 in 30 and join Waterloo Bridge at its northern end. He suggests that Wellington Street should remain as at present with a width of 50 feet, and that the new street should also have a width of 50 feet, the two streets running side by side at different levels. The scheme would permit of the building of shops along a considerable portion of the west side of Wellington Street, below the new street, and along the raised road there would also be a frontage of commercial value which would be of great importance in connection with the expense of the project. In the event of the Council's considering that the matter is one that should receive careful investigation by their own officers, Sir John Wolfe-Barry has expressed a desire to submit to those officers a more satisfactory plan than the one submitted, which has been hurriedly drawn. It appears to the committee that, before committing the Council to the scheme, it will be necessary to obtain reports upon its estimated total cost, including the promotion of a Bill in Parliament and the acquisition of property and buildings; upon the estimated return of lettings or sales, and upon the question of traffic and cross-traffic at the intersection of the Strand and Wellington Street, and then to consider whether the matter is not one to be dealt with by the London County Council, and, if so, whether that body should be invited to consider it. They recommend that the whole matter be referred to them jointly with the improvements committee, and that the two committees be empowered to obtain the reports and to consider the points above-mentioned with a view to a full and detailed report being submitted to the Council.

**ELECTRIC POWER TRANSMISSION.**

THE president of the Engineering Society of the University of Birmingham, Professor Burstall, delivered an interesting address to the members on the 30th ult. on "The Transmission of Power." The address took the form of an account of the scheme intended to supply electricity for all purposes—lighting, traction and power—and at the same time to supply cheap gas for the purpose of heating, at a price of  $1\frac{1}{2}d.$  to  $2d.$  per 1,000, and equivalent to a lighting gas of the same quality at  $6d.$  or  $8d.$  per 1,000. This Professor Burstall proposed to achieve by the installation of gasworks in convenient places close to the pit mouths, where coal would be cheap, and cheap-produced gas might be made in large quantities and transmitted under pressure to localities where there was a demand for lighting and power. The loss through leakage, he considered, could be reduced to 1 per cent. with proper care. At the sub-stations, where a demand existed, there would be large gas-engines, which would convert the gas into a three-phase current at a pressure of 7,000 volts. This, again, would be converted to 440 volts for working tramways and to 220 volts for lighting on the three-wire system. At the same time the produced gas might be piped along the streets, and would be available for manufacturing purposes generally. The system would have the advantage of cheapness, by reason partly of a valuable fertilising by-product, and would mean a total abolition of the intolerable nuisance of smoke by the use of the gas for heating and the electricity for lighting. The labour of cleaning would be largely done away with, and life in cities would be altogether cleaner and brighter.

3 feet thick and just a trifle narrower than the tomb chamber. It was upheld by six rough pillars of inferior workmanship to the other masonry and evidently temporary, and had two massive tenons on each side, fitting in vertical slots or niches in the walls. These niches were carried down about  $6\frac{1}{2}$  feet below the floor of the chamber, and in them would be placed sand to support wooden posts on which the weight of the slab, about 17 tons, would come when the temporary masonry pillars were removed. Between the two niches on each side of the chamber a pit was excavated large enough to hold a man, and the two niches had openings at different elevations connecting with this pit. When it was time to lower the stone, it would only be necessary to have a man enter each pit and open these passages one after the other in order to allow the sand to escape and the timber posts to settle slowly. Such posts were found in the niches of the two tombs containing mummies. When the slab was in place the men could crawl over it, and thus leave the chamber.

**TIMBER TRUSTS IN AUSTRALIA.**

A CONDITION of unrest, says *The Brisbane Courier*, has recently prevailed in the building and timber trade generally, brought about by the action of the new timber combine in putting up prices. The increased prices of timbers have been declared to be at least to a large extent unjustifiable, the figures being in some extreme cases as much as 47 per cent. above previously existing rates, and even more. The effect of such increases, as has been pointed out to us, could not be otherwise than disastrous. The first and most natural result would be to check building operations. This would mean to hinder investment, throw workmen out of employment at a most inopportune time, interfere with the business of builders, contractors and architects, until it finally reacted upon the timber merchants and saw-mill owners themselves, by diminishing the volume of their business. The harm would not stop there, however, for its influence would extend to the timber-getters, the storekeepers in the country districts, and all those who are concerned in the carriage of the timber from the stump to the mill, including teamsters, shippers and the State railways. It could not be expected that all these people were going to sit down under the action of the Timber Trust however. Remonstrance and opposition have been prompt, and we are given to understand are sure to be effective, so

**THE SAND BOX IN EGYPT.**

RECENT discoveries in Egypt, mentioned by Mr. Ludwig Borchardt in the "Centralblatt der Bauverwaltung," show that before the Christian era the sand box was employed in the lowering of heavy columns. Three similar tombs were found near the pyramid of Onnos, all dating from about 500 B.C., and one ready for the interment of a mummy. It was a chamber about 17 feet long, 9 feet wide and 10 feet high to the crown of the arched roof of large cut stones, the first stone arch of the kind on record. The sarcophagus was in place and over it was the heavy limestone cover slab which was to be lowered when the mummy was in position. This stone was 13 feet long,

much so that at this present moment the Trust is said to be almost inoperative, though still existing in name. The first to feel the effects of the increased prices were the builders, several of whom lost contracts through the disinclination of investors to pay the increased prices necessitated by the new timber schedule. Such a condition could not be tolerated, and an easy and effective way out of the trouble, so far as they are concerned, is found in the opportunities which exist for securing suitable timbers from outside the State. Speaking with a well-known and experienced architect on this subject, it was pointed out to us that under the new rates 100 superficial feet of Queensland pine is listed at 20s. Though in some respects Queensland pine is superior to foreign pine, there are other respects in which it is inferior, and the price of the imported article is much cheaper. In Canada, for instance, 100 superficial feet of pine can be placed on board ship for 4s. 2d. The freight on this is 2s. 6d., the duty, landed anywhere in the Australian Commonwealth, is 1s. 6d., cost of milling and dressing another 2s., a 20 per cent. profit for the merchant adds another 2s., and enables him to put it on the market at Brisbane for 12s., as against the 20s. demanded for the local article. That is an average rate, our informant stated, the imported timber being usually classified in five grades, ranging from 9s. 6d. to 17s. 6d., with good medium pine at 13s. 6d. The rates for hardwood about correspond with the foregoing. An advantage which the imported article has over the local is also found in the fact that it reaches Australia in a perfectly dry condition, whilst local timbers are rarely so unless kiln dried.

Here then was a way out of the difficulty for the builders, who consequently have taken a firm stand, backed up by prominent architects, who have declined positively to be bound by the action of the Trust. Our informant stated that it has been clearly and definitely laid down to the Trust that many of the firms interested are quite prepared to commence immediate importation of timbers from America, New Zealand, the Southern States, Russia, or any other of the numerous places where, they believe, good quality material can be obtained and landed in Brisbane at less than Trust prices. In face of this, the Trust will surely act wisely and vacate the position taken up. It is declared in certain quarters that timber has already been supplied in a number of cases at prices and under conditions similar to those which ruled prior to the new price list being issued. Pursuing our subject a little further too, it appears that in the timber trade, as in too many of our lines of business, the credit system has been and is being worked to a

demoralising extent, and the man who wants to purchase timber and has cash to pay for it can get a reduction on even the old rates.

Turning our attention to yet another leading architect of Brisbane, we received corroboration of the statement that practically the Timber Trust was broken on the matter of the increased prices, and that sales were understood to have taken place at former prices. This gentleman viewed with a deal of favour the new classification of timbers which the Trust had introduced, but the prices which had accompanied it had been a fatal objection. He had never taken a serious view of the increased prices, considering from the very outset that they could only last just so long as it would take builders and contractors to import timbers from the Southern States and other sources. If the Trust really proved obstinate and kept up the rates it could not have a very lasting effect on the building trade, all the evils would fall upon the saw-millers and merchants and those dependent upon them, such as the timber-getters for instance. As to the attitude of the architects, this gentleman said their interests were so far identical with those of the builders that they would be sure to assist in any action which the builders as a body might decide upon to face a trouble such as this. The operations of a Trust such as that under notice might have been possible before federation, but not under present conditions. Even under the old Queensland timber duties it frequently happened that Oregon and other timbers were imported for special purposes, and with this impost removed any attempt to put prices up could only have one result, and that the death of the locally-grown timber trade.

Continuing further, our representative waited on the president of the Master Builders' Association (Mr. John Stewart) with a view of obtaining from him an expression of his views regarding the effect of the operations of the Trust on the building trade of the city. Mr. Stewart first consulted a representative committee meeting. He then said that the first intimation he and other members of his association had of the formation of the Trust was contained in the following circular received at the beginning of August:—

"383 Queen Street Brisbane: July 28, 1902. Dear Sir,—As your name has been approved by the directors of the Queensland Timber Trust, Ltd., for registration in the books of the company as a contractor, I am directed to ask you to be good enough to call at this office at your earliest convenience and complete the registration. I am to urge you not to delay, as the special advantages to registered contractors can only

come into operation after registration is completed.—Yours faithfully, Queensland Timber Trust, Ltd., F. D. Cleeland, Acting Secretary."

In accordance with the request made in the circular, he called at the office of the Trust to find out what the proposals meant, and from the secretary he learnt that if he signed the register it was understood that he bound himself not to purchase timber or joinery from anyone else but members of the Trust. For thus signing away his right of purchase in the open market he would be entitled to a special discount on the enhanced prices fixed by the Trust. Mr. Stewart, however, declined to accept such terms, and understanding that there were other members of the Association and of the trade who held the same opinion as himself, he at once convened a meeting of the Association and of the master builders of the city and suburbs on the matter. The result of that meeting, which was largely attended, was that those present pledged themselves to refuse to sign the Trust's register. The Trust therefore agreed to waive the necessity for signing the register, but asked the Association to pledge themselves to support the Trust in preference to outside competitors. The members, however, were not agreeable to do this, and requested that some modification be made in the new classification of the timber as adopted by the Trust. A conference had then been held between representatives of the Association and the Trust to discuss this aspect of the question, but without result. The difficulty in the whole matter, he said, so far as the builders were concerned, was this:—That the Trust had set up a certain standard for timber which the architects might refuse to agree to. In the conditions of contract, which builders have to sign, it is specifically laid down that the architect is to be the sole judge as to the quality of the materials used in the building. Consequently, if he specified first-class timber it would mean "specially selected," according to the Timber Trust's classification. Unless the architects agree to be bound by the classification adopted by the Timber Trust, they could reject any timber which the Trust might send as not being according to that specified, and thus place the builder under the necessity of procuring another quality of timber at very much increased cost. Another aspect of the question was that, although a discount was allowed, yet there had been a very material increase made in the prices. Since August 1 these increases were further accentuated by the classification and the rules regarding specially cut lengths, &c, which had been introduced into their price list. The

increase ranged from 15 to 47½ per cent on the prices paid some three months ago. Mr. Stewart said that, tersely put, it meant that the timber used by the builders as specified by the architects will in future have to come under the designation of "special class" and "special lengths." In the present state of trade and industry the members of the Association were strongly of opinion that this was a most inopportune time to introduce such largely increased prices, because it must have the effect of checking investment in the erection of buildings or repairs to buildings. The members were quite prepared to admit that the timber merchants were meeting with difficulties and expense in getting supplies owing to the drought, and were possibly entitled to receive some increase on the rates previously paid owing to this cause, but they thought that the new classification and rates made were too great, and would tend to restrict trade. Whether the Trust succeeded in maintaining their new object of classification and rates or not, the members of the Association still retained to themselves the right to purchase wherever they thought best. He (Mr. Stewart) would point out that already Southern firms were offering to supply timbers at lower rates, but their desire was not to pass over the local industry, other things being equal.

This then is the attitude of the Master Builders' Association, comprising the majority of men interested in the building trade, and by far the largest consumers of timber in this district. Pursuing inquiries of a general nature, we have been informed that an attempt has been made by the Timber Trust to obtain control of all the country mills by inducing the owners to come under an agreement with them, by which their prices will, for a certain period, be brought into line with those of the Trust. It is understood that a meeting of country mill-owners will be held on the 20th inst. to consider the matter, but how far they are likely to be influenced remains to be seen. Competition is what will break the Trust in whatever direction they move to keep up abnormal prices. Several of the builders are turning their attention to the northern rivers of New South Wales, with which communication has now been opened up, and the practicability of securing supplies from that district is asserted by many. We have before us a price list showing the rates for timber prevailing in Sydney at the present time, and it is apparent from this that it will probably be quite practicable to bring material to Queensland, pay the scheduled rates and freight, and then land it here at a considerable saving on the Trust prices.

of the defects of the Workmen's Compensation Act is indefiniteness of what is signified by a warehouse. Among the varieties of factories are several kinds of warehouses, but from the expression "every dock, wharf, quay warehouse" it is to be assumed that not only a storehouse, but a part of a factory in which persons are employed polishing, cleaning, wrapping and packing-up goods is a warehouse. The point has given rise to much arguing in Manchester County Court. A man who was removing furniture from the premises of a house furnisher was injured by a hoist dropping on his foot and crushing it. He sought compensation on the ground that the premises were a warehouse or factory having an hydraulic lift. On the other hand, it was argued that in order to become a factory, mechanical power must be employed, and the hoist was not used as part of the process, but simply for lifting furniture in or out of the workshops. Judge PARRY thought the hoist was a mechanical power used in the process of the mechanical process. But according to the decision of Lord ALVERSTONE in *LAW v. GRAHAM*, he must come to the conclusion that the premises were not a factory. The second point was, Were the premises a warehouse? He decided that the word warehouse was intended by the Act to include big stores which traders used for storing goods for sale as opposed to small retail shops, and if he was right in that conclusion, it seemed to him that the furniture warehouse was a warehouse within the meaning of the Act. Judgment was accordingly entered for the claimant with costs.

THE pottery gathered by Mr. HENRY WILLETT has long been known to collectors. From time to time parts of it have been lent to the Brighton Museum, and were lately temporarily transferred to the Bethnal Green Museum. The whole collection has now become by gift the property of the Museum. It represents the researches of a lifetime, but it differs from most hoards of the kind in having a definite idea as a basis. Collectors, as a rule, regard only change or the style, the beauty or the oddity of a piece of pottery, but Mr. WILLETT realised that the art should be judged upon as popular sculpture. Public statues might be erected at great expense as memorials of monarchs and celebrities, but the artist in clay made his humble attempt to represent those who were admired of the people. From the reign of Queen ELIZABETH to our own days figures and paintings on pottery of the British sovereigns have been produced. By extraordinary patience Mr. WILLETT has been able to secure examples. Military and naval heroes are also to be seen. The figures cannot be taken as successful portraiture or as records of costume, but even when they suggest the ignorance of the artists, as well as of their noble patrons, the pieces are not without value. A collection of the kind is well adapted for a museum to which excursionists can have recourse. Students who are familiar with the works of the great French and Italian painters and of the painters and sculptors who co-operated with them should observe the British works with attention, for they are evidence of incipient art.

THE roads and bridges committee of the Oxfordshire County Council had recommended the adoption of tenders for rebuilding the Three Bridges at Sonning according to the plans of Mr. TOLLIT. The total amount was 7,671*l*. The committee in the report said they had given consideration to the adverse criticism of the design. They had, however, decided to adhere to the plans for an iron bridge because it was undeniable that the present bridges are unsafe and incapable of repair or restoration, and that a bridge of brick arches or of wooden construction would be wholly impracticable owing (a) to the flatness of the road-way and (b) to the fact that in the winter floods the water is to the level of the wooden bearers and submerges the lower portion of the present bridges. It was also imperative that the bridges must be of permanent strength and struc-

ture, capable of bearing the heaviest modern traffic, and also must provide for sufficient waterway to satisfy the controlling power of the Thames Conservancy. An alternative design was also prepared, in which brick piers were used and the old railings were substituted for the lattice parapet. Lord JERSEY, as a member, said he preferred the alternative plan, but he should like to have seen further modifications. Mr. BRASSEY, M.P., also approved of the alternative design as it was more ornamental; the extra cost would not exceed 1,000*l*., which would be spread over a considerable time, and it was preferable to expend the money than to erect a permanent eyesore. Finally, it was determined that the two plans should be again referred to the roads and bridges committee, and that power be given to adopt either provided the expenditure did not go beyond 9,000*l*.

THE great orator BOSSUET was a native of Dijon, but although two and three-quarter centuries have passed since he was born his native city is without any memorial of him. It is, moreover, doubtful whether one will be erected. There is a committee charged with the undertaking, and a sum of over 1,000*l*. has been collected; but although solicitations for subscriptions have been circulated broadcast there has been little response. There seems to be a fatality following the memory of the great preacher. At the time of his death he was out of favour with the Court. The bishop desired to be buried in the cathedral of Meaux, but the ceremonies were deprived of much of their majesty. His ecclesiastical vestments were dispersed as if they had gained no value from his wearing them. The bishop was in debt, and he was too poor apparently to leave the usual alms for the poor or souvenirs for his friends. His statue in the cathedral was not erected until 1820. Happily BOSSUET stands in no need of a memorial. His discourse on "Universal History," which awakened the ambition in BONAPARTE to become the ruler of the world, and his "Funeral Orations" are monuments which must endure as long as the French language.

ACCORDING to the new rules of the Board of Education relating to elementary schools, no loan of money can be obtained from the Public Works Loan Commissioners unless the whole cost of the school, exclusive of site, legal expenses, extra rooms for instruction authorised by the Code, and residences (if any), is kept within the sum of 10*l*. per child accommodated. Some additional allowances will be made on the following scale per square foot:—For a central hall or corridor, 15*s*.; cookery or laundry room, 20*s*.; manual instruction room, 10*s*. to 15*s*.; science room, laboratory, or drawing-class room, 20*s*.; teacher's room, 15*s*. From 500*l*. to 750*l*. will be allowed for a teacher's house, and not more than 400*l*. for a caretaker's house. For glazed bricks and fireproof floors (when necessary) allowance will be made according to the circumstances of the case. Allowance for mechanical ventilation will only be made in districts where the air ought to be filtered before entering the building. No additional allowance will be made in respect of any room which exceeds the maximum size specified in the rules, in so far as regards such excess. Whether the necessary loan be borrowed in the open market or not, extravagant plans cannot be approved.

NOT only in Scotland, but in other parts of the Empire the announcement of Dr. R. ROWAND ANDERSON'S knighthood must have caused gratification. He has gained a reputation as a master for his refined work in Edinburgh and elsewhere in the North, and he was one of the earliest in our time who sought the aid of painters, sculptors and mosaicists in adorning buildings. It must also be remembered to his credit that when some slight was offered to architecture by the Royal Scottish Academy he did not hesitate to resign his membership, and stood aloof from that body during several years. He has been consulted on many difficult cases by the Government, municipalities and ecclesiastical bodies. The new knight has honourably earned his distinction, and his friends will heartily desire that he may long enjoy it.

PAINTERS' ARCHITECTURE: GASPARD POUSSIN.

### THE ARCHITECTURAL MUSEUM.

THE foundation of the Architectural Museum was one of the results of the Great Exhibition of 1851. Among the numerous varieties of English work which were seen in Hyde Park, the objects in the Mediæval Court were judged to be in many respects the most remarkable of all. Although people had heard about Gothic church furniture, the majority of visitors to the Exhibition had not realised to what perfection works in metal and other materials had arrived by the adoption of the style. The contents of the court were accepted as genuine handwork, and the conclusion was drawn that men who were capable of producing so many things which were excellent would, if fine examples were placed before them, be enabled to reach a still higher standard of perfection.

There was accordingly an endeavour to obtain a great variety of masterpieces which might be imitated. Marlborough House was turned into a show-place of ornamental manufactures. The shield ascribed to BENVENUTO CELLINI was lent with other treasures from Windsor Castle. The Sydenham palace consisted principally of courts which as far as possible were direct reproductions of architectural works. But much else was required, and a museum of casts was therefore organised in Cannon Row, Westminster. The premises would now be condemned as ill-adapted for the purposes of exhibition. The building was one of those of which few survivals exist along the river-side, mainly constructed of timber, and at high-water could be approached from the Thames. Most of the promoters of the project were enthusiasts for Gothic—BERESFORD HOPE, JOHN RUSKIN, GILBERT SCOTT, RAPHAEL BRANDON, J. K. COLLING were among those who were associated with the venture. But DIGBY WYATT, Professor COCKERELL, Earl DE GREY, the President of the Institute of Architects, were no less disposed to be helpful. Prizes were offered to workmen by JOHN RUSKIN, BERESFORD HOPE and others. RUSKIN, it is needless to say, imposed conditions which were original. His prize was to be for workmanly invention and skill, not for architectural knowledge or botanical research. Any architecture approved by him was to be pure brick square-windowed cottages, and in no way Greek or Grecised. If in any ornamentation horses were to be introduced, they were not to be prancing like those in the Panathenaic frieze, and their pace was not to exceed a trot. Such stipulations were enough to suggest that the museum was to be used for the realisation of crotchets, but at the time there was so much enthusiasm about the new era in art that the museum was able to prosper. In the course of some years the collections became so extensive that larger premises had to be erected in Tufon Street. A school of art was afterwards connected with the museum, and the two form undoubtedly a valuable property.

The decline of Gothic in public favour was not advantageous for a museum which was formed chiefly of casts of architectural detail and sculpture from Mediæval buildings.

The original founders passed away, and the old support grew less generous. Thirty years ago it was proposed to pose of buildings and casts. We are quite sure the museum would have long ago collapsed if Mr. MAURICE B. ADAMS had not steadfastly held the office of honorary secretary during a quarter of a century, and stood "four square against all winds that blew." If at the present moment the museum is, as he says, perfectly solvent and able to discharge all its liabilities, it was through his resolution to face difficulties which would have daunted many other men.

It was not to be expected, however, that Mr. M. ADAMS should be content to be always acting as a buttress to the museum. In the course of last summer he suggested to the president, Sir WILLIAM EMERSON, that the project should be assigned as a free gift to the Architectural Association on the condition that the title should be retained, and that the public should have the free use of the museum. The Ecclesiastical Commissioners expressed their willingness to transfer the leases to the Association. The premises were also examined by Mr. H. T. HARE and Mr. W. H. SETH-SMITH on the part of the Association, and they expressed a desire to take them over. Finally, it was decided that a special committee representing the museum and school of art should be appointed to investigate the whole business connected with the proposed transfer and to prepare a report and financial statement.

The report sets forth that for a long while the unique collection of casts has not fulfilled more than partially the purposes for which it was originally intended. But the expenses were not diminished. During the past few years new studios have been erected at a cost of over 3,000*l.*, and the original buildings have been repaired and reroofed at a cost of 700*l.* Although the Westminster School of Art has been successful, the collection in the museum afforded little special assistance to the students, as the studies were primarily directed to the drawing from the life and kindred subjects. The special committee, consisting of Mr. SYDNEY W. LEE, Mr. W. PAIN and Mr. MAURICE B. ADAMS, proposed the following terms for acceptance by the Association:—

The Architectural Association to pay to the Council of the museum any sum which may be found necessary to relieve said Council from all liabilities after the Council shall have expended all their available funds in carrying the transfer of the Association into effect. This liability is roughly estimated at 700*l.*, including the winding-up of the Museum Association and the assignment of the leases.

To retain the services of Mr. Francis Ford, the curator, at least twelve months from March 25, 1903, at his present salary; and afterwards, should they not require his services, to pay him 2*l.* 2*s.* per week for the remainder of his life.

To pay to Mr. Holgate, assistant master since the year 1884, upon completion of the transfer of the museum, a salary of 50*l.*

To undertake, with the consent of the King, that the name of the Royal Architectural Museum shall in some way be retained.

To undertake to keep the museum open to the public, as has been the case hitherto.

The transfer to take effect on March 25 next, and to include all the fixtures, fittings, and furniture then on the premises, and being the property of the Council of the seum.

The conditions have been unanimously and heartily accepted by the committee of the Architectural Association, and are sure to be approved by the special general meeting which will be held on the 24th inst.

It is estimated that the money value of the casts and objects of art in the museum, exclusive of the historic furniture and fittings, and furniture in use in the buildings between twenty and twenty-five thousand pounds. Mr. WILLIAM PAIN estimates the value of the unexpired terms of the two leases, subject to the ground rent, at 6,500*l*.

By the arrangement the Architectural Museum does not cease to exist, but enters on a new phase of existence which may be regarded as corresponding exactly with the intentions of the founders and early supporters. If an inquiry could be made it would be discovered that hitherto more has been made of the casts by architects' assistants and pupils than by art workmen. By connecting the museum with the Association it will be incumbent on the members to employ the collections in their studies, for otherwise the contents of the museum would then resemble the proverbial white elephant. There is also the advantage that the Association can obtain a site for headquarters which is well adapted for the purpose. It was more by accident than deliberate choice that the neighbourhood of Regent Street was selected by the three architectural societies of the metropolis. Westminster is not remote from the heart of London, and it should also be remembered that of late a colony of young architects has settled in it, and the district is likely to become a rival of Bloomsbury. Both the Council of the museum and the Architectural Association are indebted to Mr. M. B. ADAMS for the part he has taken in negotiations which have ended so successfully.

### THE CONDITION OF FACTORIES.

It is unusual to have scientific investigations undertaken by the members of a committee, and for that reason an important report on the ventilation of factories and workshops may not receive the attention it merits. The committee, however, consisted of only two members and a secretary. The late Home Secretary, Sir M. W. RIDLEY, on July 13, 1900, appointed Dr. JOHN SCOTT HALDANE, F.R.S., and Mr. E. H. OSBORN, engineering adviser to the chief inspector of factories, to be a committee to inquire into and report upon (a) the means of ventilation in factories and workshops, with especial reference to the use of fans; (b) the use and construction of respirators for the protection of workpeople exposed to dust or dangerous gases. In two years they were able to prepare their first report. It is divided into three parts. One is the report and recommendations; another is an account of the conditions demanded for efficient ventilation, which is, in effect, almost a treatise on the subject, and the third is a description of the process employed for the determination of carbonic acid in the air of factories and workshops. Carbonic acid,  $\text{CO}_2$ , is the enemy the two specialists were engaged in pursuing, and it has been sought in factories or workshops for clothing, tailoring, dressmaking, bootmaking, dries, cabinet and upholstery works, bakeries, printing and bookbinding works, stationery, engineering and metal works, file cutting, textile fabrics and miscellaneous factories. No less than 600 factories and rooms have been visited, and the results of the investigations tabulated in the most exact form.

In such an inquiry it is essential to have some standard. TENKOFER was of opinion that 10 volumes of carbonic acid per 10,000 volumes of air should be the limit. CHAUMONT, whose calculations were based on the air in barracks, proposed as low a limit as 6 volumes per 10,000. A report prepared in 1887 by CARNELLEY, ANDERSON and HALDANE recommended that for crowded elementary schools a lower limit than 13 volumes could not be adopted. The authors of the report before us have come to the conclusion that under ordinary circumstances 10 volumes of carbonic acid per 10,000 volumes of air should not be exceeded in factories or workshops unless gas is burning.

In weaving sheds, where the air is artificially humidified, a limit of 9 volumes has been established by law. It is only enforced during daylight, and is considered to be rather stringent except in cases where much gas is burnt during morning or evening in winter.

It is hardly necessary to say to any one who has visited workshops that such a standard is at present very often disregarded. In a wholesale tailoring workshop in White-chapel, which was "lofty and spacious," there were 36 volumes. In "a particularly nice-looking, clean, light and well-kept room, open to country on all sides," and used as a stay factory in Gloucestershire, the inquirers found 18.9 volumes, the air outside having 3.5. In a light, clean, spacious room, heated by steam pipes and comfortably warm, and used as a wholesale collar factory, there were 38.6 volumes. In an English tailor's workshop at Cheltenham the volumes rose to 53.2. In a furrier's workshop the acid was 21; in a West-end dressmaker's it was 26.6; in a boot workshop it was 34. In a spacious workroom occupied by upholsterers 20.7 volumes were observed. In art metal works 16.4 was registered. In an engineering gauge shop it was 24.4. File-cutting is undeniably an unhealthy industry, but only in one case was 21.2 registered, and several were under 10 volumes.

In the majority of places the excess of carbonic acid is presumably owing to the neglect to provide adequate ventilation. It must, however, be acknowledged that where means of ventilation existed they were often rendered useless by neglect or the closing of them by the workpeople. Thus, in one instance, the committee report that "the high results are difficult to account for, but probably the ventilators had all been closed to within a few minutes of a test being made, as women were seen to hurriedly open them." In other cases the windows were shut, and even slight crevices were covered with paper. A printing office is described as having "twenty side windows, all closed and every chink stopped up. One roof ventilator slightly open out of six." The use of ventilators was demonstrated. An electric fitting-shop which was greatly overcrowded would, it is said, undoubtedly have been very bad but for the large amount of ventilation. Not more than 8.2 volumes were registered in it. A weaving-shed at Bolton is described as one of the most modern and perfect of its kind—clean, light and lofty, with newly-whitened walls and ceiling, and spotless stone floor. But the carbonic acid was 14.3, which was explained by the circumstance that although there were eighteen ventilators in the roof, each of 12-inch bore, all were closed. Another room belonging to the same firm, which is commended as the finest of the series, being newly painted and varnished, disclosed that the air was chemically impure, there being 16.8 volumes of carbonic acid. There were two extracting fans and both were stopped. They were set in motion and the carbonic acid fell to 10.8. The most remarkable proof of what ventilation can perform was presented in a cotton mill at Leigh in Lancashire, where the volume of carbonic acid was 2.8, which was precisely the same as the outside air.

In addition to the factories a large public hall in the provinces was selected for experiment on a day in November 1901. It was then in use as a flower show, and four or five thousand people attended. The windows were closed, no mechanical ventilation could be seen, felt or heard, but there was a large circular air grid in the roof. On the ground floor in front of the orchestra 20 volumes of carbonic acid were registered. An hour and three-quarters afterwards, when the crowd was beginning to thin, as people were leaving to catch trains, and some draughts of cool air were able to enter, the volumes fell to 14.2. Under the President's gallery at the opposite end to the orchestra the register was 19.6, and at the same spot a little later 18.2. In the first floor gallery there were 30.4 volumes, which rose to 44.4; in the second floor gallery it was 39.4, and in the orchestral gallery surrounding the organ 38.6 was registered, although under one of the circular grids. The experiment confirms the general experience about the upper part of a theatre or place of assembly being the most oppressive. Although the spectators were departing, the effect was not immediate, and it is evident that on such occasions—and the same may be said of the smallest room that has been occupied—if it is only by the

temporary absence of living beings and the employment of effective ventilation that any space enclosed by walls and a roof can be restored to a normal state corresponding with that of the outside air. While in the hall in question, with its 44.4 volumes of carbonic acid the air was suffocating and oppressive, the outside air contained 3.3 volumes, and it can hardly be doubted that such sudden changes as arise in an exit under those conditions cannot be endured by delicate people without danger to themselves.

A glance at the figures in the tables must convince the most incredulous that the condition of the interior of factories can be transformed if sufficient care is given to ventilation. It is not enough, however, to expend money on apparatus. To the humbler classes ventilation means draughts, which are often followed by colds and other forms of illness, and which may end in death. Consequently, the resident caretakers in blocks of chambers and flats, as well as male and female workers throughout the country, do all in their power to make the arrangements for ventilation useless. It is recommended by the committee:—"That inspectors of factories should inform employers of the results of any official analyses of the air in their factories or workshops, should give notice that the ventilation is deficient to any employer in whose factory or workshop the proportions have been found to be exceeded, and at the same time supply, so far as practicable, information as to the nature of any defect noticed; and that legal proceedings should not be taken against an employer unless, after a reasonable interval following such notice, the stated proportion is found, on an average of two or more samples taken in different parts of the room, to be again exceeded by one volume or more, and he is unable to show that he has taken measures reasonably calculated to secure the requisite ventilation."

It is no less essential that employers should exercise control over their workpeople. For if ventilators can be closed and fans stopped with impunity it is evident that ventilation will be no more than a delusion.

It cannot be complained that the standard of 10 volumes is excessive. The maximum of carbonic acid in the centre of London was found to be 4.8 volumes from April to September, and 6.4 volumes from October to March. The minimum was 3.0. The average for London is therefore about 4 volumes. In country towns the ratio is less. There is little difficulty in devising arrangements by which the air of factories will not exceed the 10 volume proportion, unless under extraordinary circumstances. Much else can be done besides making provision for determinate ventilation. Gas-jets may not only be wasteful but also vitiate the air. In employing gas as a motor power there is also a possibility of the combustion being imperfect, and in that way a share is contributed to the impurities. Employers (and the duty is no less incumbent on those who have undertaken the responsibility of letting rooms to tenants) should look on ventilation as an element in a system of government of which they are the head. If they cannot fulfil the duty of supervision it should be deputed to some trustworthy person.

The inquiry into the proportion of carbonic acid is only one part of what has to be done in order that factories may not be injurious to those employed in them. Very little information is forthcoming on the important subject of bacteria. The question of overcrowding must also receive attention. The minimum air-space is assumed to be 250 cubic feet per person. But in one place we find only 193 feet, in another 117 feet, and if the obstructions were taken into account the cubic space would be less than 100 feet. It is likewise unpleasant to learn that many workshops are not more than 8 feet high, although several workpeople may be employed in them. Thus in one West-end dressmaker's thirty-two people were engaged in a room 8 feet 6 inches high, and twenty-eight in one that was 7 feet 10 inches. The subjects of drainage and substantial construction are outside the province of the committee. But enough has been revealed to make the necessity evident for a vigorous application of the Factory Acts.

**Mr. W. J. Jennings**, of Canterbury, has been appointed surveyor to the diocese of Canterbury at a meeting of the archdeacons and rural deans held at Lambeth under the presidency of the Archbishop.

## FIRE PREVENTION TESTS.\*

IN more simple times three removals were supposed to be as bad as a fire. When a family occupied a house during successive generations it was reasonable to be afraid of departing from an old home, whilst a fire was taken to be the cause of irretrievable ruin. The progress of civilisation has brought more or less indifference to both. The inconvenience of removal has been reduced to such a minimum, people now consider the advantages of change outweigh the expense, and in consequence periods of tenancy are becoming shorter in duration. The study of the laws of probability has created systems of insurance which can be applied to all varieties of risk. Individuals used in cases of fire to contemplate their particular losses, which no doubt were of a kind to alarm them. Now they realise their position as units in an immense mass, and have the gratification of knowing that their losses will fall on other people, some of whom may be enemies to whom it is gratifying to mulct. A man of business is expected to have exercised foresight to such an extent as to be able to inform all who have dealings with him that on the day after a conflagration he is prepared to continue his operations in another place. There is to be not the least inconvenience to his customers except having to think of the new address in their communications. This is widely different from the time when a fire was believed to be a punishment like plague or the sword. The system of insurance has now reached such perfection that great property owners insist on their tenants taking out policies in particular offices, for in that way the landowner's interest in all the leaseholds is safeguarded without the trouble of sending a postcard to inquire whether the rebuilding or restoration of injured premises is well commenced. However remote may be any future time, it has a value in the eyes of an actuary which can be made subject of calculation, and hence the falling-in of leases: the consequence of fire is a contingency which is not to be despised.

In discussing fire problems it is well to bear in mind their scientific and economical aspects. On reading occasional accounts in newspapers it might be inferred that not only the immediate sufferers, but the inhabitants of the district around the ruins were bewailing a catastrophe. All that is merely a rhetorical tribute to imaginary people. It is rare to hear any pity expressed by the spectators of fire, and the owners of the property must have been negligent of their own interests if they cannot look on the flames which consume it with philosophic composure. The downfall of a building gives an opportunity for the erection of another more suitable to its use, but when the new plan is being suggested it may be assumed that all features which are supposed to confer more safety against fire will be scrutinised with dislike.

It is not through the operation of ignorance that buildings are erected which quickly succumb whenever there is an outbreak of fire. Few clients give their architects *carte blanche* in providing against that form of destruction. They say they pay heavily for insurance, and the reduction of the annual rates on account of improvements is not proportion to the increased outlay. Owners of buildings are likewise sceptical about the power of resistance offered by many devices in the hour of trial. Many other reasons are brought forward to excuse the general indifference to inventions which would diminish the risks of the destructiveness which accompanies fire.

To overcome so much lethargy among the British public is no light task. From time to time there have been efforts to convince owners of property and leaseholders of the necessity of adopting other means of security than ordinary building materials. Pamphlets have been issued and lectures delivered with that object, but the effect produced by so much labour has been almost insignificant. **BRADWOOD'S** death several years ago was a confirmation of what he had said about the danger which was inherent in the ordinary London warehouse. For a short time there was less confidence in the all-sufficiency of the modern system, but it was only a transient movement of sympathy, and a revolution in building followed.

\* *Reports of Fire Tests by Fire Prevention Committee.* With illustrations. Edited by E. O. Sachs. 2 volumes. London: B. Batsford.

Much credit is therefore to be given to the British Fire Prevention Committee for their persistent efforts to demonstrate how far invention can cope with the power of fire. During five years many inventions have been tested by the committee. The work has fallen on "a small executive body of twelve architects, surveyors and engineers," and it cannot be said they have always been encouraged by those who should have realised the obstacles which had to be surmounted. According to Mr. SACHS, the chairman, "the work has been carried out under considerable difficulties, meeting at first with the prejudice of many of our public building officials, who should have known better, and even to-day being ridiculed as unnecessary by the more un-intelligent or unenlightened of the Fire Brigade officers, whose operations would, as a matter of fact, be greatly facilitated if the principles put forward by the committee were generally observed." Officials and fire brigade officers are, however, only acting in the spirit of the mass of property owners. So long as safety is looked upon as a mere debit and credit affair between policy-holders and insurance companies, as it is at present, we cannot expect to see a general effort to make buildings enduring. Indeed, some people go so far as to believe that the introduction of improvements will prejudice their interests should it be necessary to make claims against insurance companies.

Experts will differ in opinion about the possibility of representing on a small scale all the peculiarities of a fire in a building. The destruction caused by heat is often exceeded by the impact of falling bodies, including, it may be, the building materials of the upper storeys. Construction in metal that seems likely to resist for a comparatively long period often instantly succumbs to the cold water of the firemen. There are few fires which do not offer surprises to firemen, however experienced. While so much must be granted, there is no doubt that the behaviour of materials and manufactured articles when attacked by flames can be anticipated by experiments, especially when they are of the character of those of the Fire Prevention Committee. The temperatures are as far as possible recorded by a special pyrometer, visual effects are photographed, deflections are measured by level and staff or by weights and pulleys. According to Mr. SACHS, "The guiding principle of the committee's investigations is the desire to record facts only, without criticism, and, as will be seen from the reports presented herewith, every effort has been made to keep even the wording as colourless as possible." It is no exaggeration to say that as many facts relating to burning as are found in the two volumes are not to be met with in all the reports and papers which are to be consulted in professional or technical libraries.

Over sixty tests are described in the two volumes. They relate to floors, ceilings, partitions, doors, glazing, &c. Some are patented arrangements, but among the 23 doors "there is not one in which either make, material, or fitting is subject to any form of trade-mark, registration, patent, or the like."

Many of the tests should give confidence to those who use fireproof flooring. In one case, where steel joists, concrete and corrugated iron were combined with a suspended ceiling, the temperature was increased to 2,000 degs. Fahr., and then suddenly cold water was applied for three minutes, the load being 168 lbs. per square foot. The ceiling fell, the floor deflected  $2\frac{3}{4}$  inches at centre and afterwards returned to within an inch of level, the concrete was slightly disintegrated on the underside, but "the fire did not pass through the floor." With a floor of wood joists filled in with concrete, the joists were ignited, but the floor stood a test of 2,500 degs. Fahr. followed by application of cold water, although weakened and deflected. It collapsed five hours after test.

The tests on doors will suggest the limitations of timber. A deal ledged door was destroyed in 25 minutes under a fire of 2,000 degs. Fahr. A pine door collapsed in 26 minutes, the temperature being 1,600 degs. Fahr. A solid framed 2-inch teak door, after 24 minutes, showed signs of flame, but resisted to some extent for about an hour. The relative merits of oak and teak are difficult to assess, for after over an hour's test, door frames remained in position, but charred on the inside to the depth of  $1\frac{1}{4}$  inch. The remains of the upper panels of the oak door "showed a small area of uncharred surface on the side

away from the fire. There were few remains of the teak door." An American walnut door collapsed in 58 minutes, while an oak door came to an end in 55 minutes. Mahogany endured for 49 minutes, while a companion in poplar fell in 36 minutes.

Professors of construction in colleges should utilise the volumes for exercises in their classes. It would be a serviceable task to epitomise the results of the experiments. The resisting power of materials has not been adequately studied hitherto, and it is no wonder, for tests are costly and difficult. The two volumes have been produced in an excellent, nay, in an attractive style. In course of time we hope to see others issued by the Fire Prevention Committee, for hitherto the subject has been treated as if it were outside practical testing.

#### EGYPT EXPLORATION FUND.

THE annual meeting of the Egypt Exploration Fund was held on the 8th inst. Sir John Evans presided.

The Treasurer's report for 1901-2 stated that the Fund and its branches, the Archaeological Survey and the Græco-Roman branch, were financially in a sound condition. As regarded the Exploration Fund, the total expenditure had been 3,378*l.* 14*s.* 4*d.*, as against 2,351*l.* 1*s.* 8*d.* for last year. The expenditure expenses amounted in all to 1,406*l.* 7*s.* 5*d.*, of which sum 1,270*l.* 16*s.* 1*d.* was directly or indirectly for Professor Petrie's expedition to Abydos. The remaining 135*l.* 11*s.* 4*d.* was incurred by M. Naville, who visited Deir-el-Bahri to finish up the opening of the temple and to complete the remaining volumes of his publications. By publications 1,608*l.* 5*s.* 2*d.* was spent, the largest amount ever incurred, and three times as much as last year. The total receipts had been 3,048*l.* 0*s.* 1*d.*, viz by subscriptions from English subscribers 1,330*l.* 6*s.* 9*d.*, including a special donation of 100*l.* from Mr. John Edward Ellis, M.P.; from the Boston office in America, 851*l.* 0*s.* 4*d.*; and from the affiliated branches of the Fund in the United States—Chicago 255*l.* 8*s.* 6*d.* and Philadelphia 150*l.*—making a total of 2,586*l.* 15*s.* 7*d.* The disbursements of the Archaeological Survey had been 783*l.* 12*s.* 3*d.*, about 260*l.* more than last year. In the Græco-Roman branch there was a total disbursement of 647*l.* 15*s.* 8*d.*, the receipts being 681*l.* 16*s.* 2*d.* The general balance-sheet showed that the assets of the Fund and its branches amounted on July 31 to 5,196*l.* 1*s.*—viz. of the Exploration Fund, 3,287*l.* 13*s.* 6*d.*; of the Archaeological Survey, 666*l.* 4*s.* 9*d.*; of the Græco-Roman branch, 1,192*l.* 2*s.* 9*d.*; and of the Survey Students' Fund, 50*l.*

Sir John Evans delivered an address in which he first paid a tribute to the labours of Mrs. F. Llewellyn Griffith, who aided in the foundation of the Edwards Library and Museum, as well as of the professorship of Egyptology in University College, London. The excavations carried on for the Fund by Professor Flinders Petrie were mainly among the royal tombs, and partly within the Temenos of Osiris at Abydos. One of the results of last year's work had been to add another name to the list of kings before the first dynasty. For the present the list stands:—Ka, Ro, Zezer, Nar-Mer and Sma. Of the antiquities found, the British Museum, the Ashmolean Museum at Oxford, the museums at Boston, New York and Chicago had been the chief recipients. The account of the work of Mr. MacIver and Mr. Mace entitled "El Amrah and Abydos" would soon be issued as a special extra publication. The archaeological report would also shortly appear. For the Archaeological Survey, Mr. Davies had again carried on a campaign single-handed in Upper Egypt and Tell-el-Amarna was the site chosen. A short visit was paid at the beginning of the season to Thebes. A magnate of that capital, Aba, in the time of the twenty-sixth dynasty, reproduced for his own tomb many scenes from that of his namesake Aba at Deir-el-Gebrâwi. All that remained of them were traced by Mr. Davies. The publications of the Survey had been increased by the first volume of Deir-el-Gebrâwi, devoted to the tomb of Aba and the small tombs of the southern group. The publications of the Græco-Roman branch were somewhat in arrear, but the large volume of Tebtunis papyri, which had just been placed in the hands of subscribers, was a double volume. They were indebted to the University of California, which provided the funds for the excavation, for the necessary number of volumes to supply the subscribers. The papyri, almost without exception, were obtained from the wrappings of mummified crocodiles at Umm el Baragât. These were edited by Mr. Grenfell and Mr. Hunt, assisted by Mr. J. Gilbert Smyly. The classical fragments were only four in number, three being fragments of anthologies or epigrams, and the fourth an extract from the second book of Homer's "Iliad," consisting of about eighty lines. Strange, too, as it might sound, there were dining clubs in those days, of the accounts of which portions were forthcoming. The members at each dinner were usually about twenty in number, and each paid 100 drachmæ, exclusive of wine, bread and gar-

lands. The names of the guests, generally about four, were given on a separate list. The cholera which during the summer ravaged Egypt was now rapidly diminishing in virulence, and Professor Flinders Petrie and Messrs. Grenfell and Hunt felt justified in returning almost at once. The programme of the Archaeological Survey for the coming season was to combine work at Tell-el-Amarna with visits to one or more of the small sites on the east bank of the river, where the copyist was much needed. The researches of the Græco-Roman branch would in the main be conducted at Hibeh. Messrs. Grenfell and Hunt had been hard at work on the Oxyrhynchus papyri, vol. iii., and it was hoped that it would be ready for publication about July next. It would be found to contain some remarkable fragments, including portions of two odes by Pindar, and a considerable fragment of the "Kolax" of Menander. Two mimos were also there, and a fragment from the "Cesti" of Julius Africanus. There were also fragments of the "Gorgias" and of the "Iliad." Among the theological fragments was one of the Apocalypse of Baruch, which was now, for the first time, extant in the Greek original, though previously known by a Syriac translation. With regard to some of the more important museums of Egyptian antiquities, that in Egypt itself had for some time been in process of removal from Ghizeh to the new museum at Cairo. The collection in the Louvre had been rearranged and its contents rendered more available for study. This has, to a great extent, been accomplished by the aid of Professor Pellegrini. The revision and rearrangement of the Egyptian gallery of the British Museum had been actively carried on by the industrious keeper of the department, Dr. Budge. Another matter to which he must refer was the Boston committee, in which there had been some friction. A new committee had been formed, which was exceptionally strong and consisted of seven members, the Emeritus professor of Greek literature at Harvard, Dr. Goodwin, being the chairman.

Professor Petrie said:—I need hardly trouble you with any details of the work of last year, as the volume "Abydos I." has been in your hands since July. The Fund has always issued its results more quickly than those of any other work, and for the last three years the publications have been given to you as soon as the collections reach England. The work of building up the early history of the dynasties has continuously gone forward, and few perhaps realise that what is now quoted as a matter of course in the order of the kings was entirely brought to light only two years ago in royal tombs. When that was published the envious remarked that we should doubtless have to change our minds because the results were so quickly laid down. But scarcely a single conclusion has been modified in the two succeeding years which have built up so much more. And the only argumentative objections that have been raised entirely fall to the ground when accurately studied.

The main result of last winter's work was the reading page by page the successive levels of the early town of Abydos; identifying the earlier levels of it with the last four stages of the prehistoric sequence dates, and the later levels with the reigns of the earliest kings. Thus an exact continuity has been determined between the end of the prehistoric age of unwritten record and the beginning of the 7,000 years of written record of Egyptian history. This is entirely the result of archæology; not a word or a sign of writing helped this discovery; and a scholar who only understood the written record would have seen nothing in the site but a meaningless cartload of flints and broken potsherds, as meaningless to him as a papyrus roll is to an Arab digger. Our knowledge of the past has gone through four stages—the gold-hunting, the art-hunting, the inscription-hunting and now the archæology-hunting. Each stage has been despised as foolishness by those who preceded it, and each in its turn has shown that there is a wider interest and a greater importance in the remains of past civilisations. In the coming year we look forward to a very definite course of work. There is the great site of the oldest temple of Abydos, on which we have only yet cleared down to the eighteenth dynasty level. The two or three yards of accumulations which lie below that must consist of the older remains of the temples which were rebuilt by the earlier kings. Reused blocks of the sixth, eleventh and twelfth dynasties show that a series of temples have left their mark, and the temple of the first dynasty kings is the goal which we seek below all these. The site is under water-level till late in the spring, and it will be needful to do the costly work of removing all the upper layers in order to dry the soil below and to be able to work, perhaps under the water, to finish it. But the most important early site in Egypt is worth some trouble and cost, to save all we can of history which will never be known except from this ground. Another great work is that of clearing out the two immense tombs of the twelfth dynasty kings, which were found last year. One of these I have gone through, and seen two vast sarcophagi of red granite and hundreds of square yards of polished quartzite lining the passages, which show the lavish care of the work. We may hope to bring some fine objects to light from the deep mass of chips and rubbish which half fills the passages

and chambers, some 600 feet long. There is also the excavation of the large fort of the Old Kingdom, within which burials of later ages have been found, but as it has never been really cleared out there is much to be done in it. And besides this, the great cemetery of Abydos has been by no means exhausted yet. Now all this work is a very large amount to cover, far beyond the scope of one person. The ideal of the Fund has hitherto been that of individual explorers, sometimes with assistance, examining a single building. This has perforce had extensions, but the unit of work has been the type. I hope that this year will see a different ideal established, that of a group of workers, each devoted to a separate ground, and all co-ordinated in methods and results by one organiser. The committee have agreed to the principle of extending the work by joining more workers together, and we go out this year a much larger party of united workers than we have ever had before. To my great regret we have lost the help of the most capable student we have had, Mr. Arthur Weigall, who has been offered a position in Egypt in which he will find future scope. We start, therefore, with entirely new helpers. Mr. Hugh Stannus has offered for this year his skill in architecture and drawing, which will help to clear the history of the Osiris temple. Mr. Currelly, Mr. Rawnsley and Mr. Ayrton are all new to the subject, and with different capacities and in various ways will, I hope, take charge of parts of the works. Miss Hansard has volunteered to stay and give us some help with artistic drawing, and Miss Eckenstein will attend to the camp work on the collections. My own business will be organising, arranging and interpreting the work, drawing and preparing for publication. On collateral work, apart from the Fund, Miss Murray and my wife will be copying a great inscribed tomb. Thus we shall be a party of nine, and hope to get through in one season what on the old rate would have taken three years. There can be no question that this is far the more economical way of working; and it is obvious that the more we can show done the better encouragement there is to subscribers at home and abroad. We start, therefore, on what will, I hope, be a new type of working for the future, and shall have a staff which will render the Fund less dependent than before on the health of any one worker. It is the duty of this Society to rescue what we can in Egypt before it is entirely wrecked by the dealer, the ignorant amateur and speculator and the commercial destroyer, none of whom leave a shred of information; and a duty which has its scope in the present generation particularly, as at the rate of wreckage there will be but little left behind for future lives to explore. Now is the time.

#### THE SURVEYORS' INSTITUTION.

THE first ordinary general meeting of the session 1902-3 was held on the 10th inst. at the Institution, Great George Street, Westminster, and there was a large attendance of members. The president, Mr. Arthur Vernon, in his opening address, congratulated the members on the flourishing state of the Institution. There were now on their roll a total of 3,424 members, drawn from almost every part of England, Scotland, Wales and Ireland, and including 20 colonial Fellows. Of this total no fewer than 1,433, omitting students and ordinary Associates, had qualified by examination. The Council had been able to accumulate invested funds to the extent of 10,000*l.*; the Institution was free of debt, and they were in receipt of an income equal to the annual outlay. Those who founded the Institution in 1868, the President said, were animated by an unselfish desire to raise the standard of the profession alike in the interests of surveyors and the public. There were at least four things absolutely necessary to every thoroughly qualified surveyor—knowledge of his art and the basis of the law, science and practice of his profession; the study of the application of such knowledge to practical work; the cultivation of a sound judgment combined with tact and good manners in dealing with the problems that came before him, and the strictest honesty and rectitude of conduct, with a fastidious regard for professional etiquette and the best traditions of the profession. Examinations could fairly test the first and second of these requirements, but no certificates could guarantee or examinations prove the possession of a sound and sober judgment, which was only of slow growth and depended on many moral and intellectual qualifications. The Institution had often been asked to adopt a scale of fees for professional work, but experience had invariably shown this to be undesirable. Reviewing the present position of the land question, the President said the principle of assessment on farm lands was still grievously unfair, but he was of opinion that the landed interests of the country were in a better condition now than they were ten years ago, though reform was greatly needed in the system of valuation for purposes both of local and imperial taxation. In spite of present difficulties and depression, he believed in the land and in its future appreciation and increasing attractiveness to the investor.

## TESSERÆ.

## Contrast and Opposition.

THE art of painting is that which will best explain to us the precise value of the words "contrast" and "opposition" when applied to the fine arts. Painting, when considered only as the technical use of colours, exists solely by virtue of opposition. What are tints, semi-tints, shades and gradations of light but points of opposition, the almost infinite variety of which is occasioned by the attempts of art to imitate the effects which nature, in a manner peculiar to herself, displays in every object in creation and in each of the different parts of such object. These wonderful effects are produced by the numerous points of opposition which the art of the painter enables him to draw from very few colours; and these points of opposition, as every one knows, consist of combinations of scarcely perceptible differences of light and shade, clearness and obscurity, strength and weakness. Painting, however, is not confined to this mode of imitating nature. It can address itself not only to the eye, but to the mind, and it can copy not only the minute gradations of colour, but those bold and striking effects which alike dazzle the senses and excite the imagination. For instance, when an unexpected change is introduced from a smiling landscape to a wild and savage country, interspersed with threatening rocks; when forked lightning is made to furrow the horizon, or when the flames of a volcano, or of a fearful conflagration, glare through the darkness of night. These are what are called contrasts in nature, and these can never be produced in painting by gentle transitions of shade, deepening by almost imperceptible degrees from light to darkness; but by sudden, bold and vigorous changes, and by using colours which afford the greatest and most striking contrasts to each other. The power of producing contrasts is one of the advantages that painting has over sculpture, which, from its nature, is incapable of contrast, and admits of only very slight opposition, and which in this particular stands alone. This appears to us the easiest and clearest mode of explaining the distinction between opposition and contrast. The same distinction between contrast and opposition which is found in painting exists in all the other fine arts; but, of course, it is most conspicuous in those arts which operate most forcibly and directly on our senses. Thus music, which cannot exist without opposition, since it consists of a succession of different tones opposed to each other, can also display, when necessary, the most striking contrasts. It can pass suddenly and abruptly from the faintest sounds to those resembling thunder; and, when employed to express the moral affections, it can glide from the expression of the softest sentiments to the noisy contrast of the most stormy passions. Poetry also consists of alternations of opposition and contrast; opposition, produced by a succession of images, which, though all are of similar nature, are yet different, and so arranged as to display their points of difference sufficiently to avoid monotony; and contrast, produced by bold and striking combinations of images, evidently and clearly distinct. The effect of contrast is, then, to carry the mind suddenly by an unexpected impulse to the enjoyment of an impression of astonishment, which, being powerful, ought neither to be of long duration nor frequently repeated. Reason and a feeling of propriety can alone fix the limits within which every principle applied to the fine arts must be confined, and these limits vary with different kinds of art.

## Constable's System.

"In art," says Constable, writing in 1829, "there are two modes by which men aim at distinction. In the one, by a careful application to what others have accomplished, the artist imitates their works or selects and combines their various beauties; in the other he seeks excellence at its primitive source, nature. In the first he forms a style upon the study of pictures, and produces either imitation or eclectic art; in the second, by a close observation of nature, he discovers qualities existing in her which have never been portrayed before, and thus forms a style which is original. The results of the one mode, as they repeat that with which the eye is already familiar, are soon recognised and estimated, while the advances of the artist on a new path must necessarily be slow, for few are able to judge of that which deviates from the usual course or are qualified to appreciate original studies." In this passage is contained both the principle of Constable's painting and the history of its results; for strange as it may seem, so little do general observers look at nature with an observing and pictorial eye—so much are their ideas of what it contains received at second-hand by reflection from pictures—that the forms under which artists have combined to represent her (forms representing, it may be, a portion of the truth, but certainly not the whole truth) have, in the great majority of cases, superseded the stamp and authority of nature; and truth itself, where it did not steal in under a conventional garb, has been refused admittance by more than one committee of taste. "What a sad thing," Constable writes to Leslie, "that this lovely art is

so wrested to its own destruction. Used only to blind our eyes and to prevent us from seeing the sun shine, the fields bloom, the trees blossom, the foliage rustle, while old black, rubbed out and dirty canvases take the place of God's own works." With his mind made up as to the course to be adopted, Constable betook himself to the study of nature on the spot. Careful drawing was his first object, as the substance to which the embodiment of colour and chiaroscuro was to be applied, and without which, though there might be effect, there could be no truth. His studies of trees and foreground are said to have been eminently beautiful. These, however, he loved to exhibit in their vernal rather than their autumnal character. "I never did admire the autumnal tints, even in nature—so little of a painter am I in the eye of common connoisseurship. I love the exhilarating freshness of spring." Buildings he did not court, but rather avoided, though in later life he grappled successfully even with architectural detail, as in his pictures of Salisbury Cathedral, but in general he dealt with it sparingly. Shipping and coast scenes he considered "more fit for execution than for sentiment." What he luxuriated in was the study of atmospheric effects and the principles of light and shadow as applied to his sylvan and pastoral landscapes. "I hold the genuine pastoral feeling of landscape," said he, writing in 1829 to his friend, Archdeacon Fisher, "to be very rare and difficult of attainment. It is by far the most lovely department of painting, as well as of poetry." "Painting," he says in another letter, "is with me but another word for feeling, and I associate my careless boyhood with all that lies on the banks of the Stour. These scenes made me a painter and I am grateful." "Whatever may be thought of my art, it is my own, and I would rather possess a freehold, though but a cottage, than live in a place belonging to another."

## Eighteenth-Century Gardens.

Thomson's poem on the Seasons is said to have had a great effect in encouraging a taste for the beauties of nature. Literary men practised what they professed to teach; they laid out grounds for friends and, where they had the opportunity, for themselves. Pope with arrogant humility professed to be prouder of his garden than of any other of his works, and is said to have given many hints to Kent. Shenstone "planted groves rural" (according to his Anglo-French epitaph), where a stream which boasts its perennial murmurs is "taught to flow" over small pebbles when the gardener turns a key, and the Naiads are invited in a pompous inscription to bathe their tresses in a crystal lake which his admirer Gilpin is obliged to confess is a muddy pond of diminutive dimensions. Kent had brought "objects" into fashion, and he set the example of building them as he would have painted them, apparently forgetting that they could be approached and that they could be viewed in other combinations than those for which they were designed. All styles, all mythologies were confounded. Here elves and fairies are invoked, there fauns and hamadryads. A Chinese pagoda looks down on a Christian hermitage. The ruins of a Gothic priory stand in salient opposition to a bran-new temple, with statue and altar all complete, to Bacchus or to Pan, and Whatley thinks these heterogeneous objects sufficiently assimilated and amalgamated by the decorative character which pervades them all. The votaries of nature had their affectations as well as the pupils of art. Liliputian groves were made to boast their deep solitudes and invite the visitor to forget the world. The whole garden was turned into a school of moral sentiment or a museum of the tastes and sympathies of the owner. To soothe "blest shades" or to please "pale ghosts," shabby urns with fulsome inscriptions are erected in the greenest and dankest corners of the walks. Abstractions enjoy a large share of deification. Here a portico is owned by Friendship and the earwigs; there a grotto beplastered with brown moss is occupied by Somnus, who in a Latin epigram promises sleep, and, he might add, a severe cold. Temples to poets and obelisks to statesmen mark the owner's literary and political predilections. Lord Temple's gardens at Stowe were political; and as his politics changed, it is said he changed the objects of his vistas and the deities of his shrines. His "Elysian fields" were studded with busts of the British worthies, and his worthies retained their titles and their pedestals by virtue of their votes in Parliament. When the spaces were considerable and the architecture handsome, this style of gardening produced considerable effect; but when attempted with insufficient means, nothing can be conceived more "paltry" and affected. It was the day of shams and surprises; views were blocked out by ugly walls or dense plantations, till they "burst" on the spectator at some favoured corner; mock towers embellished a "prospect"; Druidical temples of brick or timber (Whatley gives a recipe for making them) "added horror" to the woods; false bridges concealed the termination of artificial water, or disguised the absence of water altogether; a miniature castle or artificial ruin read a lesson on sublunary grandeur and masked a tool-house; and all this was done in the name of nature and simplicity.

## NOTES AND COMMENTS.

IN Mediæval times the Abbey or Nunnery of Shaftesbury was one of the most honoured in Great Britain. The body of King EDWARD THE MARTYR was said to have been conveyed to it after his murder. The renown of so important a relic was widespread. It was while visiting it that CANUTE died and was afterwards interred at Winchester. The wife of ROBERT BRUCE, the Scottish king, was for a year a prisoner within the abbey. Recently a local committee undertook excavations on the site. The work was commenced on June 9 and continued until November 1, when the operations were suspended until next year. Mr. DORAN WEBB has charge, and at a meeting a few days ago he announced that the cost of the work had amounted to 156*l.*, of which sum the Mayor and Corporation of Shaftesbury had contributed 50*l.* Visitors to the site and annual ticket-holders had paid 15*l.* 10*s.*, the remainder of the money having been furnished by members of the committee and others interested in this most important archæological undertaking. He said that very satisfactory progress had been made with the work and some very interesting discoveries made, details of which he hoped to embody in a report which he proposed printing at a later date. Sketches of the work will be included. In Shaftesbury there is much confidence in the successful conclusion of the exploration.

IT is anticipated that much which is interesting to architects will be discovered in the German explorations in the neighbourhood of the Temple of the Ne-Wossre Kings, who reigned in Egypt about two thousand years before the Christian era. The operations are under the direction of Dr. LUDWIG BORCHARDT, architect and technical attaché to the German Consulate in Cairo. The temple is in such a state that reconstruction, if desirable, could be attempted. There is a court the walls of which were covered with plaster; on both sides were offices or sacristies connected with the services. In a second court sixteen granite columns still remain; each is a monolith wrought like a bundle of papyri. One of the walls was of extraordinary thickness, and in it was a cavity or niche containing a statue of a lion which, judging by fragments, must have been larger than life. The execution is superior. The decoration of the temple was costly, for there were reliefs representing kings and gods. This part of the work is likely to be sent to the Berlin Museum. Many of the architectural fragments are of an important character. Some of the mummies wore coloured masks formed of linen and plaster. The graves are of many ages, and the latest must have belonged to Greeks, to whom also must be ascribed various manuscripts containing passages derived from Greek poets and dramatists. As the exploration is the first undertaken in recent times by the Germans its success is sure to be regarded as an incentive to further efforts.

IN 1887 the Royal Society of Painters in Water-Colours presented examples by the members and associates as a memorial of the Jubilee of Queen VICTORIA. Another series of portfolios has been offered to the KING and QUEEN with the following dedication:—"The happy and auspicious occasion of the Coronation of your Majesties has prompted us, the undersigned members and associates of the Royal Society of Painters in Water-Colours, your Majesties' grateful servants, to dedicate to your Majesties these drawings as a small mark of our loyalty and affection." The drawings are mounted and are enclosed in three box portfolios. The works are generally characteristic of the artists' styles. Among the contributors is the Princess LOUISE, Duchess of ARGYLL. The President has an Italian landscape. The collection is of great interest and deserves to be regarded as representative of the water-colour art of the present time. The Society has now nearly completed its century of existence, as it was founded in 1804. Originally there were sixteen members and they formed a school which has not its superior in Europe.

THE latest "Christmas Art Annual" published in connection with the *Art Journal* is devoted to the life and works of Sir W. B. RICHMOND, R.A. He is one of the

artists who need an interpreter. Hereafter he is likely to be referred to as an example of susceptibility to prevailing influences. LEIGHTON, WATTS, MILLAIS may be named among the modern masters who can be considered as affecting his work. His latest landscapes may be said to be Whistlerian. Sir WILLIAM RICHMOND is not too old to show his courage and begin a more personal expression in art. The "Annual" should be looked upon as a record of only the first part of his career. Few contemporaries have produced so many varieties of painting. He has been persistent in study and labour, and always inspired by lofty aims. The illustrations in the pages are likely to be a surprise to many readers, although they may have seen the original pictures. The exercises in sculpture should have received more attention. Versatility has held too much sway over the artist, and the biographer should not have hesitated to lament the parochialism which is likely to divert the power of Sir WILLIAM RICHMOND from art in order to exercise "a little brief authority" in a suburb.

THE French publication *L'Art*, which is true to its title by recognising the arts of all times, places and varieties, has presented as one of its large presentation plates an etching of CLARKSON STANFIELD'S *Tilbury Fort*, one of the most characteristic works of the able marine painter. As a foreign rendering of a painting that is essentially British the plate is remarkable. "Stanny" was always glad to introduce architecture in his coast scenes as in his *Ischia*, and the Italian structure which rises from the salt marshes must have been even more pleasing to his eyes than it is to most of those who sail along the river. *L'Art* is now publishing selections from the letters of PAUL BAUDRY, one of the greatest of the French painters of the nineteenth century. Another series relates to the French painters who belonged to the period between the Revolution and the Restoration. Some were Academicians, but in less than a century their names and works have vanished from the thoughts of amateurs. The sketches they made from contemporary life are very curious. *L'Art* continues to keep its position in the forefront of French publications, and astonishes as much by the quantity of its illustrations as by their quality.

## ILLUSTRATIONS.

CATHEDRAL SERIES: HEREFORD.—LOOKING INTO NORTH TRANSEPT.

NEW PREMISES, CORNER OF YORK STREET AND GARFIELD ROAD, TWICKENHAM.

THE building is in red brick and Portland stone, with shop fronts in teak and pilasters in polished granite. The work has been carried out from the designs and under the superintendence of Mr. THOMAS R. RICHARDS. York Street is a new road recently constructed by the District Council, being the main road through the town from Richmond to Teddington and Kingston, and the tram lines have just been laid through it to connect these places. Within a few yards from the building the new tram lines from Hammersmith, Brentford, &c., meet, and the street will become the main thoroughfare for business in the place. Two banks are now in course of erection there.

THE WHITE HART HOTEL, AND SHOP, CORNER OF ST. MARY'S BUTTS, READING.

THESE buildings are about to be erected in the place of some old property about to be demolished for street widening, &c. The materials will be buff terra-cotta with deep red bricks between. The lower part will be faced with glazed bricks of a deep tint. The Mansard roof will be covered with green slates and dark red tiles. The contractor for the first portion is Mr. H. W. GODWIN, of Reading.

The architect is Mr. GEO. W. WEBB, F.R.I.B.A., Market Place Chambers, Reading.

SYWARD LODGE, DORCHESTER.

LENTONHURST, NOTTINGHAM.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair.

The following were elected members:—Messrs. P. Luker, M. C. M. Leggett, T. A. Jaques, E. M. Ellis, B. E. Atkinson, un., R. W. White, A. E. Brooker, H. Hutchinson, F. B. H. Parrel, W. Jones, H. T. Tovey, H. A. Aitken, J. S. Cable, T. C. Mears, J. H. Reynolds, J. Ewing, F. J. Matthews, E. L. Hampshire, E. F. C. Buckley, H. A. Fairhead, J. C. Bull, D. Winder, A. E. Richardson, V. Hooper, S. L. C. Gilks and V. Flockhart.

## Proposed New Premises.

The PRESIDENT said it would be in the minds of all members that the question of the necessity of new premises had been before them for some years. The last president, Mr. Seth-Smith, had instituted a fund towards that end. The subscriptions received, however, were not sufficient to enable the committee to start proceedings. On October 27 last a communication was received from the Royal Architectural Museum and Westminster School of Art in Tufton Street suggesting that the premises as they stand might be handed over to the Association as their premises. This proposal has been considered by the committee of the Association and the following resolution passed:—"That the committee of the Architectural Association, having considered the communication of October 27, 1902, made by the special committee of the Council of the Royal Architectural Museum and Westminster School of Art, unanimously and heartily resolves to accept the conditions suggested in this communication by the Council in transferring their premises to the Architectural Association, subject to confirmation by the body of members in general meeting."

A special meeting of the Association to consider these proposals is to be held in the rooms of the Royal Institute of British Architects, 9 Conduit Street, W., on the 24th inst. at 7.30 P.M. Mr. F. C. EDEN read a paper entitled—

## Roof Coverings.

I have to ask your pardon to-night for two things; firstly, for what I am going to leave out, and secondly, for what I am going to leave in. I am obliged to omit much of what I might otherwise have said—as I once heard a preacher lament after an hour of violent exertion—because each of the materials with which we have to deal would supply matter for a paper to itself; and, on the other hand, some of the suggestions which I offer with great diffidence may be at variance not only with the well-thumbed rules of the text-books,\* but with the practice of those who know much more about these things than I do.

It has often been a surprise to me to notice in how many modern buildings of something more than a pretence to architecture, the roof seems to have been left almost to chance. And yet the roof exerts an influence which, though often unperceived, affects the mind so powerfully because, far more than any peculiarities of detail, it impresses the building with the indefinable stamp of character and of style. Surely it is lost labour to be, like Wren, "as nice as the pedants" about mouldings, without, as he did, devoting equal care to the covering of the roof. Just as the most beautiful stone which nature has to offer may be spoilt by stupid and mechanical tooling, or still more so by polishing, as in the case of granite, so the form of a roof may be as elegant as possible, but if the covering material be unintelligently made or mechanically applied, the roof must be ugly. Architectural beauty is, indeed, but skin deep. Goethe's maxim, "Take care of herself beautiful, for the useful can take care of itself," contains that good sense which usually lurks at the bottom of a paradox; and is especially true if we apply it to that most utilitarian part of a building, the roof. Beautiful materials make good roofs, and ugly materials, without exception so far as I know, prove in the long run to be bad materials. In reply to the question, What makes a roof beautiful, or the reverse? I suppose the answer most commonly given would be form and colour. This is only partly true. The really important quality, in my judgment, is texture. A roof may be poor and neutral in colour, as are many of the old Cornish roofs of Delabole slate (though, indeed, if she find the surface sympathetic nature usually takes care of the colouring), but with good texture the simplest roof becomes interesting and paintable. The true reason why Westmoreland slates make a better roof than Welsh is not because they are green and the others blue, but because they cannot be split so thin or be so

mechanically dressed. There is a thin green slate in the market which makes as ugly a roof as ever emanated from Port Madoc.

A feeling for texture is every whit as useful to the architect as an eye for colour. In the case of every material with which he has to deal he must make a choice between those true and false methods of workmanship on which texture of surface mainly depends. In masonry he has to choose between mechanical or sham tooling, or dragged face on the one hand and the traditional tooling peculiar to each different kind of stone on the other; in brickwork, between the thick brick with narrow joints (specified four courses to the foot) and the thin brick with wide joints; in structural timbers, between the markings of the circular saw and those of the adze; in carved work, between the tale of the tool and the trail of the glass-paper; in plaster, between the artificial, screeded level surface, with sharp arrises, and the natural trowelled face, with angles soft and rounded; in lead, between milled and cast; in window glass, between the slight convexity of crown—so valuable in external effect for its brilliancy and changefulness—and the tinny mottling of sheet or the flatness and blackness of plate; in metalwork, between the marks of the hammer, and the neatness begotten of the scratch-brush and the file. In every case he has to choose between texture and the absence or presence of it; between a monotonous surface and an interesting one. Let us, then, see how this choice may be exercised in the matter of roofing. In theory, I suppose, all are agreed as to the rightness of using local materials. It is in practice that the shoe pinches, since cheapness of transit has put so many and great temptations from Bangor and Broseley in our way. But, stale though the exhortation be, may I urge that, however monumental buildings and buildings in large towns be roofed, in the country and in dealing with cottages and other small buildings it is of the utmost importance to the landscape that the natural material of the countryside should be used rather than material imported from a distance.

One of the greatest charms of old towns and villages lies in the unity of the roofs—all of one material and all of one pitch. Here slates from Westmoreland do not jostle tiles from Broseley; here are no domes of the south to swear with the steep roofs of the north, nor are steep roofs seen side by side with flat ones; in fact, here are none of those incongruities which are popularly supposed to produce picturesqueness. This is simply the local material asserting itself, together with that feeling for unity in the roofs of a district which the builders of old always exhibited. Owing to the large expanse of a single material which most roofs in this country show—often in far larger unbroken surfaces than the walls of the buildings they cover—the material with which they are covered has a greater æsthetic importance, especially in distant views, than the material of the walls. The smaller the building the truer this is felt to be, till in a cottage the roof becomes the feature on which the beauty of the whole depends. Let us then suppose—not to be too ambitious—that a cottage is being built in a tile district. Some might prefer (for reasons which will appear) laying the tiles on riven oak laths rather than on boards or battens, bedding them, not in mortar, which either drops out or holds the wet like a sponge, but in hay, moss, reeds, dried marsh-grass, or whatever may be the available material and traditional usage of the district. The problem—almost an insoluble one—is how to admit plenty of air between the tiles while excluding fine, powdery snow. "Nobody," says Mr. R. Nevill, "who, in taking off old roofs, has ever seen the horrid mess to which the hay in a few years becomes reduced would ever think of adopting so useless and pernicious a method." Felt, he goes on to add, is no better, and after some years becomes worse than useless. A draughty cock-loft makes a dry roof. But if the aspect be much exposed, the under-side of the tiles can be torched, this method being perhaps less open to objection than bedding in mortar. Fifty degrees is a suitable pitch. What builders call the square pitch, or pitch of 45 degs., hardly ever looks right, whatever the roofs be covered with. If the roof be of the collared rafter form the timbers might be of larger scantling than the usual 4 inches by 2 inches, but spaced further apart, say 1 foot 6 inches to 2 feet from centre to centre; the intervals need not be equal. The timbers being large enough to be framed instead of spiked together, a stronger roof is obtained, while the slight sag of the laths between the rafters produces that ribbed appearance which we admire in roofs that have kept out the weather for generations, and which is the result, not so much of age as of this method of construction. Another advantage incident to the use of laths is that owing to their irregularity it is impossible to get a straight edge to the courses. The examination of ancient examples makes it clear that effects of this kind were studied and not accidental. For instance, in repairing the fifteenth-century roof of Ockwells Manor—a house evidently designed with much thought and skill—it was found that the purlins were placed at such a level that the rafters did not touch them by about 1 inch until they were loaded, and when the roof was stripped they sprang back to the straight

\* For instance:—"The Welsh slates . . . split finer and to a more uniform thickness, and are bluer in colour than the others; those from Westmoreland are rougher, thicker and consequently inferior, and of a dull greenish tint."—Seddon, *Builder's Work*, 122. "In good slating, the vertical joints of the alternate courses should range in straight lines from ridge to eaves, and the tails of the slates should be in perfectly straight horizontal lines."—*Building Construction*, Rivingtons. I. 1901 Ed. 209.

again. By this simple means the position of the principals is marked on the outside of the roof by a gentle undulation; not an untruthful method of construction, and one which serves to give delicate relief to the roof planes without destroying their breadth and simplicity, relief which we seek in vain with gablets, dormers, bands of glazed tiles and what not, whereas it is just this soft play of light and shade upon an otherwise unbroken surface which gives so much quiet charm and character to old-world roofs.

Coming to the tiles themselves, what are the characteristics of a good plain tile? What are we to require of the tile-maker? "A good tile," says Mr. J. P. Allen, "should be hard, well burnt, well shaped, non-absorbent, of good colour, and with a glazed or vitrified face to prevent vegetation" ("Practical Building Construction," p. 209). The section on tiles by Professor Henry Adams in the work called "Specification" contains this specification clause:—"Cover the roofs with first quality hard-burnt, pressed, dark Broseley tiles of approved manufacture, with ribs but not nail holes, laid to a 4-inch gauge, and each tile bedded in lime and hair mortar." Well, I think it safer to have nature on one's side rather than attempt to defy her. All she can do with "pressed dark Broseley tiles of approved manufacture," or indeed with any thin, flat, vitrified tiles, is to scale them, crack them, blacken them and finally blow them off the roof. But a rough, hand-made, sanded tile she will not only waterproof, if that be needed, but will paint it with her most delicate greys and brightest orange. Firstly, then, no Broseley or other machine-made tile can possibly, owing to its flatness, uniformity and unsympathetic surface, produce a roof with any character—a roof such as an artist would care to paint. A good tile will be hand-made. Then as to size. Some old ones are as narrow as 4 inches; 6 inches is a usual width, but I think 5 inches to 5½ inches looks better. With hand-made tiles there is no difficulty, if the order is given in time, in procuring them of any specified width, the mould, from which many thousand tiles are made, costing about 2s. 6d. The length is usually about 10½ inches, but the thickness is the really important dimension, and nothing under a full ½ inch should be used, ⅝ inch is better. Next as to shape. The set of a tile or curve in the direction of its length is given by placing it when partially dried on a shaped bed of sand, but the buckling or curve across its width is the result of hard burning. A buckled tile means a well-burnt tile and should be by no means rejected. Buckled tiles are especially useful for wall tiling, and when the sun strikes obliquely across them the effect is charming.

Texture of the surface of each individual tile is produced by plentiful sanding, and by not scraping out the mould too often in the effort to get a neat tile, as near as possible to a machine-made one. The nail holes are better punched by hand, and not by any mechanical process, as is sometimes done, even in hand-made tiles. The slight inequality in the level of the holes causes the tile to hang unevenly—a little matter, but an important one, as when each course looks as though laid to a steel straightedge the effect is unpleasant. The colour of a tile depends on the amount of iron in the sand, and on its being burnt with a clean, fierce flame such as wood gives. With wood the temperature can be more easily varied than when coal is used, and it is possible to obtain a greater intensity of heat towards the end of the burning, so as to bring about that incipient vitrification of the middle layer of the tile without affecting its surface, which makes it impervious to moisture. Needless to say, tiles should not be "selected for uniformity of colour," as some specifications require. It is only by slight varieties of colouring in the separate tiles that the colour of the roof as a whole becomes beautiful. In a good roof there are many little practical dodges to defeat the weather which all help to give interest and variety to its surface. For instance, where the tiles abut against vertical surfaces, as chimneys, gable copings, party walls and the like, they are given a slight upward tilt sideways to throw the water away from a naturally weak place. This was the case in all the old roofs at Gray's Inn, until they were relaid in recent years, when they were all smoothed out with admirable skill, so that the rain has every inducement to soak into the mortar fillets.

A similar practice is that of laying a tile flat along the verges against the end rafter. This gives a side tilt, which prevents rain water trickling down the gable face. This especially made tile, known as "tile and a half," should be avoided, as the effect of a very broad tile in every other course is unpleasant. A good tiler can work the verges perfectly well without it by a little cutting.

For ridges nothing is better than the plain half-round. It has a sanded face, like the common tiles, and is thicker—say, about 1 inch—and is bedded in hair mortar. A thickish projecting fillet of white mortar over each joint has an agreeable effect. I have not noticed it in this country, but it is the usual practice in the North of France. Special end ridge tiles do not look so well as a bottle end or pebble in mortar in an ordinary ridge tile. For the valleys it is not always necessary

to use valley tiles or lead. A pleasant effect is produced by sweeping the tiles round. This involves a certain amount of cutting and some packing on the back of the valley rafters, and unless you are fortunate enough to have an unusually skilled and old-fashioned tiler, an enormous amount of personal supervision. But I think the result is worth the trouble.

It is pleasant to think of a roof of tiles or slates as a kind of coarse drapery or tarpaulin, which roughly takes the shape of the framework over which it is thrown, softening all harshness of outline with the gentle undulations into which it naturally falls. The great enemy to be overcome in roof design is hardness. In the typical modern roof each plane looks as if cut off in one piece from some stiff and flat material, like the cardboard roofs of a badly-made model, and makes hard mathematical angles at its intersection with the adjoining planes. For all their fantastical extravagance the roofs of the Low Countries teach us this lesson—that slates, if small enough, can be made to cover any form you please—domes, bulbs, spheres, to say nothing of hips and valleys, like the scales of a fish, so that a complicated roof can be designed without a single mitred or mechanical angle.

It may or may not be true that you can always tell an Adam house by the eaves; but, anyhow, they are not a bad test of a well-designed house, for the most emphatic point in a small building is the eaves. They occur at the wall-head, to which the eye naturally travels, just where there is the most marked change of plane and of material, accompanied by a strong line of shadow. So it is easy to see that by unskilful treatment of this part the effect of an otherwise good roof may be completely marred. When the sprocket-pieces or rafter ends show, their management demands great care. Nothing can be worse than the effect of a row of narrow sprockets laid on edge, all of exactly the same scantling and all spaced at exactly the same interval—possibly all varnished into the bargain. A better way is to lay the sprockets flat; whatever you do with the rafters, to space them unequally and to vary their sizes. In small houses, where the eaves have much projection, the soffits can be boarded, lathed and plastered, or treated as a cove. With slight overhang, a cornice of wood or stone may be comfortably tucked under the projecting tiles or slates.

All eaves' gutters are something of a disfigurement. Substitute for the pleasing irregularities of the natural eaves' line a line just as hard as cast-iron can make it; in other words, fix a half-round gutter, and not only eaves, but, to a great extent, elevation also will be spoilt. Where it is necessary to collect the rain water, or where walls are thin, it is better to use wooden spouting. It may be square or V-shaped in section or hollowed out of the solid, but it must be kept small or the effect is clumsy. The downpipes in this case will be of wood with tapering heads, and will stand clear of the wall, to which they are attached by long holdfasts. When a parapet or cornice gutter is out of the question, nothing looks so satisfactory as dripping eaves. It is the rule where thatch is used, and with the majority of old roofs, though it must be acknowledged that with 9-inch walls the result would probably not justify a reversion to methods that are suitable only to good building. At the same time, it is not likely that dripping eaves have ever done as much damage in three centuries as neglected guttering and downpipes, choked with their own rust and discharging the collected water of successive seasons into the walls, have done in a single generation.

Of slate roofs, I think those are prettiest where the slates are very small and thick, and the graduation not too obvious. Old Cornish roofs are of this type: they sometimes have two or three courses of very large slates at the eaves. What are known as stone slates, such as occur in Oxfordshire and Gloucestershire, make, perhaps, the most beautiful roof of any. Of the heavy Horsham slates, as used upon Sussex houses, Mr. Dawber writes:—"The slates are very large at the eaves and diminish in the usual manner to the ridge; but they lack the finish and texture of the small Cotswold stone slates, and are more nearly allied to the heavy roofs of Lancashire and Yorkshire. We notice that directly these slates are used the pitch of the roof is flattened, for these old builders, so sound in their practical knowledge, at once recognised the impossibility of covering with heavy stone slates steeply sloping sides where all the drag and strain would be on the pegs and laths, and to this can doubtless be attributed the reason of our constantly finding these roofs cemented and stopped with mortar, for their flat pitch has the disadvantage of not always keeping the wet out without extraneous aid."

In Gloucestershire, I believe, the roofs are galletted as well as torched—that is to say, after the slates are laid they are gone over carefully on the underside, and small slips of slate are inserted in the larger crevices which arise from the unevenness of the slates before the torching is proceeded with.

When the roof is of steep pitch and shows conspicuously against the sky, lead is not suitable, except to monumental and lofty buildings, in which the proportion of visible roof to wall surface is not large. A cottage roof, with eaves 10 feet or less

from the ground, would not be a pleasing object if covered with lead. When the roof is flattish and but little seen, or entirely hidden by parapets, as in many late village churches, lead is the obvious material to use. Again, it is especially suitable to those small and highly decorated roofs such as often surrounded octagonal turrets of the Tudor period. One or two such roofs of tabernaclework covered with lead still survive at Hampton Court. These were doubtless originally brightly illuminated and gilded. On Barnard's Inn Hall is a good tower in turret form covered with lead. One of the most interesting examples of this kind of work that I know of is the old belfry at Calais, which is well worth missing a train to see.

As with other kinds of roof, so with lead, there are several devices in the laying invented for purely practical reasons, but which lend aesthetic effect and interest. For instance, in many old churches, including Exeter Cathedral, the sheets are not laid parallel to the gable copings, but strike into them at an angle. Then, too, the boarding under the lead in Mediæval roofs was not close laid, but with gaps of about 2 inches between each board. The motive of both these devices was, by increasing the friction to keep the lead from creeping, and each gives some interest to an otherwise mechanical surface. The boarding in old roofs is almost invariably oak; with modern imperfectly seasoned wood chemical action is set up and the lead perishes, but if the boarding be thin, say  $\frac{1}{2}$  inch, and water seasoned, I believe it is safe to use oak; however, no doubt desilvered lead is more easily acted upon by acidulated vapours than the lead which was used before 1840, when the desilvering process came into use. In modern roofs the rolls are often too big, owing to the use of a wooden core. A felt is better, except in flats, where there is likely to be much walking about, and the wooden roll is a necessity. There is no practical reason why the sheets should all be of equal width and a very good æsthetic reason why they should not be. I do not say that they should vary to the extent noticeable in old roofs where there has been much patching, but just enough to destroy the mathematical accuracy which teases the eye.

In old English roofs there is no ridge roll, but the sheets are lapped over several feet at the top and I believe the ornamental ridge was rare. There is the well-known exception at Exeter, where the ridge of the cathedral has a simple cresting of fleurs-de-lys. Old prints of Holyrood show a beautiful ridge of crowned roses and thistles; but here, no doubt, French influence was at work. On church roofs one may often see the dates at which repairs were executed accompanied by the churchwardens' initials. These are cast on the sheet, and some of them, as at Minster, in Thanet, are elaborate and interesting. There is some suggestion for ornamentation in this. A simple powdering of symbolic or heraldic device, gilt, might be worth attempting. The old lèche on King's College Chapel, Aberdeen, is decorated after his fashion, with monograms, lily-pots, thistles and crowns. The roof of the cathedral at Troyes is said to have been diapered with golden flames. But it is easy to overdo these things, and I think some of the elaborately tinned and painted French roofs of which one reads must have been overdone.

Gilding is as a rule safe enough. In the East domes are often gilt all over. In Western surroundings the effect might be unpleasant, but parcel gilding, as on the dome of the Invalides, is most valuable. I should like to see the ribs on the dome of St. Paul's so treated. The effect would not be in the least barbaric, but refined, owing to the delicate effects of the curvature of converging ribs which would be brought into relief by the gold. The lead used should be cast, not milled. "It is almost useless," says Mr. Lethaby, "trying to put interesting workmanship into dull and poor materials. It must be allowed that modern sheet lead has a poor, mean, rushed mill-board look, and its wretched colour puts it quite out of court as anything but a mere makeshift. Cast lead, on the contrary, has a beautiful surface, it is cast with the greatest ease, with the most simple of appliances, and does not blacken by exposure to the air as milled lead does. . . . In gutters and flats cast lead should be used, if for practical reasons alone. . . . It is said that milled lead was introduced into England about 1670. The plumbers of the time opposed its use and said it could not be durable. The Milling Company replied by offering to keep milled lead of 7 lbs. a foot in repair for forty years for an insurance of  $\frac{1}{4}$  per cent. That to me seems saying very little for the material; it would have said little in the Middle Ages at least. Then the forty years' view of things had not been invented."—*Journal of the Society of Arts*, lv. 456.

The greater number of lead-roofed buildings have parapets or cornice gutters, but in many old churches there is no gutter, and the lead hangs easily over the eaves like a frounce, which gives a curiously forlorn look not without charm. It is just his gentle dressing of the lead which is so appropriate. Modern plumbers like to dress lead far too hard, especially where, as over cornices, they have a fillet to dress it to. The result is that the drip is spoilt, and the water runs back over the members of the cornice and down the wall.

Thatchers must be a stubborn race, for they have preserved the traditions of their craft in spite of modern improvements, and though the best materials are not now available, reeds being no longer grown for the purpose, and wheat straw being too much broken by threshing machinery, their work seems to be as well done as ever. Neatness, which is the bane of slate and tile roofs, is most appropriate to thatch. The more it resembles well-combed fur, and the less it suggests a heap of sodden refuse, the better.

The characteristic beauty of thatch is the grace and ease with which it undulates over hips and dormers, and projections of every kind, combined with the curious sense of snugness which it conveys. No eaves gutters are used, and no flashings are necessary against stacks or gable copings. If the walls are plastered a coating of tar about 1 foot 6 inches high along the base is a sufficient protection against damp.

The thatchers' trade is slowly dying out. Between the years 1851 and 1891 their numbers declined from 6,000 to 3,000; and it is to be anticipated that they will not be able much longer to resist the inroads of improvement and the superior attractions of corrugated iron.

Mr. H. D. SEARLES-WOOD, who proposed a vote of thanks to the reader of the paper, said he was too great a philistine to agree with all that Mr. Eden had said. He, the speaker, had a personal experience of some of the experiments proposed in the paper, and they did not recall happy results. He was therefore out of sympathy with many of the methods mentioned in the paper.

Mr. MAURICE B. ADAMS seconded the motion. He said he was somewhat in sympathy with many of the methods mentioned in the paper, though he was sure there were practical difficulties in the way of their adoption. Local by-laws and other restrictions by governing bodies would often make it extremely difficult to carry out the suggestions.

Mr. H. LOVEGROVE, who supported the vote, disagreed with almost all the proposals in the paper. Architects had to satisfy their clients, and few of the suggestions would find favour with them, therefore they hardly seemed practicable. He was sorry Mr. Eden had not dealt more with the practical details of roof-covering, because the roof of the house in every country was of importance. The Dutch and Swiss roofs were very picturesque, and the people attached so much value to good roofing that they even built movable roofs to protect their crops.

Messrs. R. H. WEYMOUTH and LOUIS AMBLER supported the motion.

The PRESIDENT in putting the vote to the meeting said the paper had certainly given rise to a great diversity of opinion, and there seemed to be a little confusion. Some of the speakers did not realise that which Mr. Eden had in his mind. The paper probably dealt only with roof-coverings to cottages and houses in the country, and not with those of town houses. The text-books were most misleading concerning materials to be used in construction. It was absolutely false to say that a hard material was more endurable than a soft one.

## RELATIVE PERMANENCE OF STEEL AND MASONRY CONSTRUCTION.

(Concluded from last week.)

W. HILDENBRAND, M.Am.Soc.C.E.—With reference to the old Roman viaducts and aqueducts mentioned in this discussion, which are frequently quoted as evidence of the longevity of stonework and its superiority over iron structures, the speaker wishes to draw attention to the fact that in other Roman structures may be found equal evidence of the durability of iron. Remnants of bridges over the Rhine, built by Julius Cæsar, have been dug up during the past fifty years, while the work of regulating the bed and current of the Rhine has been going on. In Cæsar's "Commentarii de Bello Gallico" one of these bridges is minutely described, corresponding in construction to what would now be called a timber trestle, consisting of heavy oak logs connected with iron bolts, clamps and spikes. Quite a number of these logs were found under the bed of the river, nearly 2,000 years after they had served for carrying the Roman legions over the Rhine in their attempt to subjugate a free nation, and the timbers, as well as all iron bolts and spikes, were in a perfect state of preservation.

This fact corroborates Mr. O'Rourke's assertion that iron submerged in pure water will probably never corrode.

Of course, every object in this world perishes, or, rather, disintegrates and changes into some other form, but if building materials can be preserved for several thousand years, it may be said that, for all practical purposes, they last for ever.

The question whether metal will in the future be considered as permanent and durable a building material as stone cannot be solved at the present time, and it is not likely that

any who are here will live to see it solved. The answer to the question cannot be found by theorising, but depends entirely on experience, which should extend over centuries.

At present we have, so to say, no experience at all about the durability of iron or steel structures. It is barely sixty years ago that the first iron bridges were built, and it is doubtful whether a single one of that age is in existence to-day. Nearly all the early iron bridges have been removed and replaced by modern structures, not on account of having been decayed or weakened, but because they had outlived their usefulness, and stronger ones were required to accommodate the increased and heavier travel of modern times. Our experience as to the durability of iron and steel structures, therefore, is very limited, and only of recent date.

If a stone building and a steel building were erected side by side, and both structures were left to themselves, without any attempt to protect them against the effects of the atmosphere, there is no doubt that the stone building would stand very much longer than the steel building. In New York city there is an example in the New York and Brooklyn Bridge. The massive stone towers, which are now more than twenty-five years old, have no protection against the weather and have never been repaired. They are to-day as they were left by the hand of the mason twenty-five years ago, and, according to a recent thorough inspection, they are just as good and perfect as they were on the day they were finished. On the other hand, the steel and wirework requires constant attention; there is hardly a time when no men are seen suspended in the meshes of the wirework repairing something or putting on a coat of protective paint.

The speaker has had the opportunity of examining suspension-bridges erected more than forty years ago, and while he found the cables as a whole in perfect condition, he also discovered one or two places where, through the accumulation of water or through imperfections in the protective paint, the wires were considerably corroded and needed repairs. All of this shows that metal structures require attentive watching and constant renewal of paint or other protective coverings, and that any oversight or inattention is followed by grave consequences.

With our present knowledge, therefore, we may sum up by saying that unprotected masonry, as well as unprotected ironwork, is perishable, but that the former will last much longer than the latter. However, if iron or steel be well protected, it is known that it will not decay in thousands of years, and will be as durable, if not more durable, than any stonework. Will the means for an efficient and permanent protection of steel ever be discovered, or will a new metal be found which has the same strength as steel, and which naturally is not subject to oxidation?

H. S. Haynes, M.Am.Soc.C.E.—Mr. Hildenbrand has referred to iron bolts in bridges built by Cæsar across the Rhine. In the Colosseum, built about A.D. 80, the courses of heavy travertine masonry, laid with knife-edge joints without mortar, were connected by iron cramps fairly well protected from the weather. Many of these were cut out in the Middle Ages, but those which remain appear to be in good condition. The vault of the Pantheon, 140 feet in diameter, is of concrete supposed to be strengthened with iron rods. This vault, built about A.D. 125, is, to all appearance, in excellent condition. From these instances, it would seem that iron used structurally in connection with stone or concrete masonry may remain efficient for nearly 2,000 years.

Iron is not readily oxidisable in pure water, for the oxygen therein chemically combined is only separable at an excessively high temperature. It is the atmospheric oxygen ordinarily present in water that is the oxidising agent. Water absorbs carbonic-acid gas to an extent equal to its volume, and the water thus acidulated acts powerfully upon iron or steel. It follows that in large cities where the atmosphere is heavily charged with the products of combustion the falling rain would be correspondingly charged with carbonic-acid gas, and therefore that the effect of oxidation upon steel construction should be proportionately greater from exposure under such conditions.

A. L. Johnson, M.Am.Soc.C.E.—In reference to a statement concerning the corrosion of the steelwork in the large buildings in Chicago, C. T. Purdy, M.Am.Soc.C.E., was one of the members of a commission to examine and report on the condition of those buildings. The speaker having talked with Mr. Purdy recently concerning this matter, it may be appropriate to give some of the results as described by Mr. Purdy. His report has undoubtedly been printed ere this, and probably, therefore, there will be no objection to the promulgation of the information at this time. The commission examined quite a number of the buildings in Chicago and found numerous cases of corrosion in the columns; but it was not developed that the corrosion was confined to the outside columns, or even that it was greater in them than in the interior columns. The beams in the foundations, Mr. Purdy said, were found to be in uniformly good condition. The commission's recommendation

would be that in future all the steelwork for these buildings should be entirely surrounded by a Portland cement or lime mortar, this covering being filled in solid behind the fire-proofing.

In St. Louis a very well-constructed building, erected about twenty years ago, is now being dismantled. The construction consisted of solid external walls, cast-iron columns throughout the interior and steel beams painted with red oxide of lead paint. The building was eight storeys high and of fireproof construction, the floor arches being mainly of brick, though there were also some concrete arches. The steel throughout is in a thoroughly well-preserved condition, it having been in a cases entirely embedded in Portland cement mortar or concrete covering. The paint also has been thoroughly preserved and, in the speaker's estimation, an embedment in Portland cement mortar is the only means of preserving that preservative.

Professor Spencer Newberry, manager of the Sandusky Portland Cement Company, recently gave a lecture in Chicago which the speaker regards as one of the most valuable articles with regard to steel-concrete construction that has appeared in print for some time, covering, as it does, all sides of the question, and some sides in an entirely new manner, such, for example, as the theoretical considerations involved in the preservation of iron by Portland cement covering. In this article he shows that the cement, theoretically, is not simply a neutral or non-injurious agent, but is actively engaged in preventing the formation of rust.

The speaker's company has samples of steel embedded in cinder-concrete, in the form of broken pieces of a test-span made in the fall of 1898 and tested in February, 1899, these pieces having lain on the ground uncovered, subject to the action of the elements, for more than three years. On numerous occasions these pieces have been broken open for the purpose of observing the condition of the metal, the most recent case having been before the Engineers' Club of St. Louis last January, in connection with a talk given by the speaker, and in all cases, without any exception, the metal has been found to be as bright and clean as the day it came from the rolling-mill. The quality of the cinders in this sample was considered very poor, containing a good deal of dirt, and the fine material was screened out. This the speaker regards as desirable, though not absolutely necessary, where cinder-concrete is used, inasmuch as, if it is not done, a slight film of rust will be formed on the metal. This film, however, never increases in thickness, but as it costs little to avoid it the best practice would call for the screening of the cinders. In the speaker's opinion the reason for this difference in action is due to the fact that the fine stuff contains finely divided particles of sulphur, which are readily dissolved by water, slightly acidulating the same, and until the concrete dries out thoroughly a slight corrosive action is taking place. This is soon neutralised by the influence of the Portland cement, but not before a film of rust, not in itself materially injurious, is formed.

Mr. Darrach has expressed himself as of the opinion that at the present time we are not able to calculate the strength of steel concrete beams with any degree of accuracy. The speaker, of course, will have to take exception to that statement, he having on numerous occasions endeavoured to show how this could be done, and, being of the opinion that the data with regard to the materials used being known, he could arrive at the maximum carrying capacity within about 15 per cent., which is certainly close enough for all practical purposes, in view of the factor of safety used. Of course the strength and the modulus of elasticity of the concrete and steel must be known, and, as to the former material, these functions are seldom accurately known, chiefly because no special tests are made to determine this for the materials available for that particular work. Their influence on the character of the design is enormous, and, on work of any considerable size or importance, these values should be obtained before the designs are prepared.

As to the relative lasting qualities of the different kinds of engineering structures, the speaker is of the opinion that only a few forms of stone masonry can compare in length of life with a concrete construction reinforced with steel properly distributed through the cross-section. Strange as it may seem to those not conversant with the facts, the maintenance-charges for stone masonry on many railroads exceed these charges for steel structures in proportion to the relative quantities of each. On railway work it is usually a condition of taking what you can get rather than what you would like to have. Many forms of sandstone are worthless. Limestone is dissolved in the course of time by atmospheric influences, and there are really only a few kinds of stone that can be considered as everlasting, and these are usually so expensive as to prohibit their use. A very good example of the dissolution of limestone masonry is afforded at the Cabin John Bridge. Underneath the arch may be noticed stalactites forming along the line of the mortar joints between the granite arch-stones from the spring-line some distance up toward the crown. The back-filling of the arch consists of a considerable depth of limestone-rubble

masonry. A considerable quantity of water finds its way down through the haunches of the arch and then through the mortar joints of the arch-ring, and the stalactites indicate that the air and water are dissolving this limestone backing. This same action exists to a greater or less degree in all limestone structures.

In a large city in Indiana the speaker recently examined some limestone bridge-masonry which had been in place for about forty years, and much of it could now be scraped up with a fire-shovel.

In the speaker's opinion plain concrete construction would not be everlasting, on account of the cracks which are almost certain to develop in such structures, these cracks filling with water and freezing in the winter, and gradually getting worse and spawling off as the years go by.

In steel-concrete construction, if the metal is properly distributed and proportioned to the cross-section, these cracks can be absolutely prevented. The speaker's company has built walls 300 feet long, with steel reinforcement, in which no expansion-joints were provided, and in which not a sign of a crack is to be seen, and would take a contract to build such a wall a mile long under this guarantee.

To accomplish this result, however, it is necessary to have a subdivision of the metal reinforcement into small areas thoroughly disseminated through the section, just as in successful arch construction it is necessary to have the metal thoroughly disseminated in small areas through the upper and lower portions of the sections. Heavy concentrations of metal at points 2 or 3 feet apart will not give the peculiar stretching quality to the concrete obtained by the other method, and which is essential to success.

When properly built, this steel-concrete construction will not crack, will not be disintegrated by frost, will not be dissolved by the elements, and, in the speaker's opinion, is the only kind of engineering structure that can be considered permanent, with the exception of one or two kinds of rock masonry, the cost of which in most cases would be prohibitive.

F. Lynwood Garrison, Assoc. M. Am. Soc. C. E.—Since there seems to be some confusion or misunderstanding regarding the corrosive action of atmospheric and other influences upon iron, it might be advisable in this discussion to state briefly a few of the most important characteristics of metallic iron that are pertinent to the subject, although in so doing the risk of repeating some well known facts must be incurred.

1. To begin with, iron is one of the metals most easily oxidised and affected by moisture, consequently it never occurs in the metallic state.\*

2. Iron does not undergo any alteration in pure dry air at ordinary temperatures.

3. In moist air iron becomes coated with ferric oxyhydrate, having approximately the composition  $\text{Fe}_2\text{O}_3(\text{OH})_2$ . The rust varies in composition with the conditions under which corrosion takes place.

4. According to Percy, iron does not rust unless there is an actual deposition of liquid water upon the surface of the metal.†

5. The presence of certain gases and vapours, even in minute proportions, such as sulphuretted hydrogen ( $\text{H}_2\text{S}$ ), hydrogen, chlorine and acetic acid, accelerates rusting in moist air, though no liquid water may come in contact with the metallic surface. Carbon dioxide ( $\text{CO}_2$ ) and ammonia gas are said to act less energetically in this respect.‡

6. Iron rust often contains minute quantities of ammonia, due, it is supposed, to the decomposition of the water by the action of the oxide on the metallic iron, the oxygen combining with the iron and part of the hydrogen uniting in the nascent state with the nitrogen of the air.

7. Pure water deprived of air appears to be absolutely inert as far as corrosive action is concerned on contact with iron, even at 100 degs. C.§

8. Rust formed far beneath the water consists of black hydrated magnetic oxide.

9. The formation of rust takes place in the beginning but slowly; after a thin coating has once been formed, the corrosive process goes on more rapidly.

10. Aqueous solutions of potash, soda and ammonia preserve iron from rusting, provided they are not too dilute.

11. Water containing not more than one-fifth its volume of lime water is said to preserve iron from rusting.

12. The contact of iron with more electro-positive substances, such as zinc, retards corrosion; whereas contact with more electro-negative substances, such as tin, lead and copper, accelerates the rusting.

13. Magnetic and similar oxides of iron, which constitute

the basis of iron scale, protect the iron which they coat, but hasten the corrosion of rusted iron, whether such be the adjacent portions of the same piece or in separate pieces which are galvanically connected. This protective action is shown by the comparatively slow rusting of Russian sheet-iron, of "blued" iron, and of castings that retain their original skin.

14. While contact with zinc and highly zinciferous brasses retards rusting, contact with copper, or brasses rich with copper, hastens it.

15. According to Martell, the purer qualities of mild steel when used in ship-hulls are more likely to be corroded than impure iron. A steel ship requires more care than an iron one. Nickel steel is not so likely to be corroded in salt water as the ordinary and purer grades of steel.

This array of more or less well-known facts might be indefinitely elaborated; however, it covers the subject completely in a general way. It seems to be a perfectly sound conclusion that, other things being equal, where likelihood of corrosion is effectually prevented, iron (steel) makes as permanent and durable a building material as masonry. Better, in fact, for whereas the latter will certainly in time disintegrate, the former cannot. Unusual conditions may certainly exist in which the molecular structure of the metal may change; such, however, must be regarded as abnormal and exceptional.

A statement has been previously made in this discussion to the effect that, inasmuch as iron properly covered with fire-proof material or concrete will not corrode, uncovered iron in the interior of buildings will be immune from corrosion because it is then covered from the weather on all sides. Were walls and roofs absolutely water or moisture proof, in fact, if the buildings were hermetically sealed, top, sides and base, then, and then only, would the interior metal be free from corrosive influences. As a matter of fact, in most cases, the dangers from corrosive deterioration are much exaggerated; the greatest objection to steel buildings is their instability in fires. Mild steel, at a white heat, is about as stiff as cheese, whereas masonry is not affected in the same way at high temperature, and resists collapse to a far greater degree.

The speaker's belief is that in practice a thick covering of cement concrete is the only material that absolutely protects iron from corrosion. Such a compound structure unites the advantages of both component materials, and greatly surpasses in strength and durability an edifice made of either alone.

All are familiar with the remarkable strength and endurance of "wire-glass," the glass sheet being cast and rolled so that the wire net is completely covered with the glass, imparting to the natural fragility of the latter a certain amount of elasticity and abnormal strength; the glass, in turn, absolutely protecting the wire from corrosion. So long as the wire is covered such a composite sheet will hold together, unless broken by a force greater than the tensile strength of the wire.

Not being a structural engineer, the speaker may be unfamiliar with certain objections to composite concrete and metal structures; in his ignorance, however, he cannot but think that such compound constructions will be the true and logical line of development in the future.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE following address was delivered by the president (Mr. Butler Wilson, F.R.I.B.A.) at the opening meeting of the session on the 6th inst:—

When I had the honour of addressing you last year it was with a full sense of the responsibility which belongs to the occupation of this chair. The fact that you have done me the honour of re-electing me to this position has intensified my realisation of what is due to you and what is expected from your president.

The opening meeting of our session is a fitting occasion to refer to some of the considerations which I venture to think have affected, and will still further affect, not only our interests as architects, but also the interests of our clients. Perhaps it is within your recollection—if not, you will permit me to remind you—that the subject that occupied our attention last year was the necessity for "enthusiasm." However much we may have imbued our minds with this great quality, we constantly find our enthusiasm "cribbed, cabined and confined" by relentless present-day needs and conditions. To-night I shall refer to some of those ever-increasing difficulties which beset the path of the most enthusiastic.

I will first speak of the difficulties which interfere with the realisation of perfect planning. It is often our happy lot to have at disposal a situation for our building which imposes no restraints and presents no difficulties. Then, indeed, we have only ourselves to blame if the result is not all that it should be. On the other hand, we may have to deal with a site which bristles with obstacles and restrictions. In such a case let us never make the fatal mistake of endeavouring to place there a

\* Exceptions must be made where the iron is of undoubted meteoric or non-terrestrial origin. In such instances it is usually alloyed with a large proportion of nickel.

† "Metallurgy of Iron and Steel," p. 27.

§ Mallet, "Report British Association, 1840," p. 229.

preconceived arrangement, only suitable for some totally different situation; rather should we endeavour to turn obstacles into advantages, and let the peculiarities of our site give rise to a building which shall almost convince the beholder that no better situation could have been chosen. Some examples of what has been achieved in this way will occur to you. I might mention the Palazzo Massimi, Rome, one of the finest examples of the culminating period of the Italian Renaissance, which is built upon a confined and extremely irregular site, and is a beautiful display of the keenest judgment and ingenuity of planning under the most adverse conditions.

The art of planning in former times was confined to a very few types of building, which did not call for much variety, and there were plans characteristic of these buildings which became models and were handed down from century to century. But we are confronted by the requirements of to-day, which embrace the conditions of modern progress. New trades, processes and industries spring into existence, and must be suitably housed and provided for. Hotels, industrial dwellings, hospitals, workhouses, public baths and libraries, places of entertainment and other structures, supplying a multitude of wants, can only be successfully dealt with by a careful study of their needs and workings. Though we all may have the desire to make ourselves thoroughly acquainted with our client's needs, and do make every endeavour to that end, those endeavours are often met by ill-concealed indifference on the client's part. This indifference often expresses itself in some such words as these, "Get the building finished, and we will adapt it to our requirements."

But, gentlemen, we must not be satisfied to rest here. We must often go to the length of extorting from the client or his employes the information of which we are in search. In short, we must get to know more about the working of our client's business, from our point of view, than he knows himself. Let us be even in advance of our client's ideas, not only thoroughly up to date, but as far in front as may be. It is our business to discover some advantage which, although our client may have had it vaguely in his mind, he has not been able to formulate. We must be determined to fulfil requirements in a far more complete way than our client has ever imagined. By these means we can enhance the reputation of our profession as a body of men who are capable of making suggestions and giving advice of the greatest value to those who are retaining our services.

An architect was recently called in to design a building to be fitted with machinery, and the client took exception to what appeared to him to be the unnecessary inquiries of the architect, as to the number and size of the machines, amount of working space and other details. His idea was that he had employed the architect to erect a building upon a given space, and that he should be concerned only upon the erection, and the client would then place the machines in situ without any assistance from him. Nevertheless, the architect made diligent inquiries of the actual users of the machines, which resulted in a very slight alteration in the width of the building, thus enabling an additional row of machines to be placed within it. On perceiving this, it dawned upon the client that the architect's method of meeting the requirements was correct, and more especially when he saw that the architect had made himself thoroughly acquainted with some of the workings of the business, and would not allow him to make such a vital mistake as would otherwise have occurred.

Another difficulty which confronts us is that of adapting the acknowledged forms of architecture to the ever-increasing advantage of modern constructive inventions. The architect of the past was governed by the constructive materials which were at his disposal. Architecture possesses both body and soul. It is a unity of matter with imagination, and while we are endeavouring to infuse our schemes with the imaginative element which should never be absent from architecture as a fine art, we are hampered at every step by the intrusion of the constructive as opposed to the reflective element. This fight between material and imagination does not decrease with the advance of time, and there is no doubt that many accepted forms are under certain modern conditions far from applicable to functions which this age demands. These demands are not likely to grow less. The times are giving birth to them in bewildering profusion. To grapple with them, and at the same time preserve the essential qualities of our art, is the task which lies before us at this present moment. It seems to me that this can best be done, not by ignoring or rejecting inventions and appliances which, on the grounds of their practical utility, have come to stay, but by a frank acknowledgment and acceptance of their value and a determination to make them our servants rather than our masters. We must be ready to progress in this respect, and to seize upon all that is best in modern constructional methods, for there is no law born of past experience which may not be instantly repealed owing to the appearance of new conditions and materials. If architecture as a fine art is to live it must adapt itself to present needs, and the difficulties that face us.

are the requirements and problems of to-day. It will be obvious that the architect of to-morrow will be faced with difficulties unknown to us, and with this feeling it will be somewhat easier for us to face the facts which call for our efforts.

In former times, as the architect considered himself fully equipped to practise his art by a knowledge of the five orders, so the building was erected by means of the five trades. Different conditions prevail to-day. Not only is an acquaintance with the five trades necessary, but an acquaintance with others which, fulfilling modern requirements, demands our recognition, and their name is legion. We have amongst others fireproof iron and steel construction, terra-cotta and faience, electricity, heating and ventilation, concreting, asphalt, draining, artificial stone, hydraulic and mechanical appliances, elevators, wrought metalwork, mosaics, glass, furniture and decoration, horticultural and landscape gardening.

Iron and steel have almost ousted carpentry from buildings of any size, and our equipment is far from complete if we do not make ourselves thoroughly acquainted with the various systems of fireproof construction. The arrival of the flanged beam and iron joist marked a great era. Steel, combining as it does the virtues of cast and wrought-iron, can be utilised for supporting enormous loads. Its uses and applications are governed by formulæ the outcome of exhaustive experimental tests. How far the employment of this material may be carried is shown us by our American brethren in the skeleton skyscraper. The idea that constructive metalwork needs concealing from view is rapidly dying out, and a feeling is taking its place that iron construction should be frankly exhibited. Our leading architects do not now disdain the use of rolled girders in the decorative treatment of ceilings. Again, we have steel roofs, which have changed all our canons of design and caused us to abandon former methods. The advent of architectural faience has resulted in the superficial decoration of our structures. There are new and various inventions connected with the construction of fireproof floors and partitions. We are now able to build a partition 2½ inches in thickness, which our local authorities recognise as a 9-inch brick wall, for fireproof purposes.

To enumerate all the valuable inventions which are now ready to our hand is beyond the scope of this address. Briefly I would impress upon you that architects are indeed feeling the steady invasion of the technical constructor. Technical construction is advancing, so must we, not lagging behind but marching ahead of it. If we relax our watchfulness we afford opportunity for the constructive specialist to gain an ascendancy, and irrevocably forfeit our position as chief controllers.

Leaving the question of construction, there is an invasion which, if it is allowed to continue, will end in disaster; an invasion of the domains of our art by a commercial element coming forward and successfully luring numbers of our brethren to relinquish their hold upon the æsthetic side of architecture. The busy practitioner is tempted by the readiness of the trade to relieve him of the arduous work of design. The tempting words, "Designs furnished free," are constantly meeting his eye. The terra-cotta manufacturer, the cabinet-maker, the mosaic worker, the glass stainer and the ornamental plasterer offer "designs free." I counsel that on no account should we accept their offers. Any such acceptance will disgrace our profession. We can design for ourselves—if we cannot, we are not worthy the name of architects. Some may say that whether the architect or tradesman designs, the client is only paying once for his art. This is a fallacy. You cannot get anything for nothing. The tradesman will see that he is paid for any work he does, including his "designs free." To suggest that the trade have become designers owing to the incapacity of the profession becomes an intolerable charge. Those who labour at design to give their best, as much for their delight in the work as for the remuneration they receive, must view these offers of "designs free" as an insidious encroachment upon the honour and rights of our profession.

And now, gentlemen, to speak of "Architecture as an Art." Our great ambition is to clothe our buildings with some part of the qualities of proportion, dignity, poetry, and imagination; those elusive and indefinable qualities of great architecture, the attainment of which may not come, even after a life-long searching. The architect who commands these qualities and cannot help it will invent work of beautiful proportions, but it is as impossible for him to impart to others the means by which he does so as it would have been for Shakespeare to instruct as to how a play should be written.

The laws of proportion are too subtle to be propounded, the qualities of grace too elusive to be enumerated. Although we cannot readily acquire that which shall enable us to attain our object to the full, we can do something to prevent ourselves committing gross errors. We can at least store and again store our minds by the study of acknowledged types of beauty. If we possess any receptivity, such a study cannot fail to leave permanently in our memory some residuum of appreciation for grace, some sensitiveness to all that is bad in form, proportion and workmanship. It must help us to know

when we have done something which is ungracious—help us, in short, to become our own severest critics.

Let us try and produce that which is expected of us by our fellow-workers. We know well that the most gratifying reward of our labours is the appreciation of our brethren, who are so alive to the difficulties which they themselves have to grapple with. The true artist is concerned as to what his fellow-artists will think of his work. To accomplish our end we as enthusiasts must engender in our minds that sensitiveness to both good and bad without which nothing beautiful can be created.

Having spoken of the approaching invasions of our art and the difficulties which beset the enthusiast, I will now endeavour to point out the means by which the invasions may be resisted, the difficulties overcome. Our battle-cry is education.

As Sir William Emerson said in one of his addresses at the Royal Institute of British Architects, "There can be no doubt that the most important question of the moment is the necessity for a better and more methodical system of education for our students in architecture than exists at present. The pupil, as a rule, picks up his knowledge piecemeal, in a haphazard sort of way, with but little attention from the one who really could teach him. Then in order to pass the Institute examination the student crams with teachers. The cramming may have the result of passing him, but it leaves him still inadequately educated. Further, there is in all our schools too much concession to temporary or ephemeral fashions, notwithstanding many good examples of work done by our architects of this century in various defined, sober and self-restrained styles. Men such as Barry, Scott, Cockerell, Soane, Nash, Wyatt, Pugin and Burges knew the groundwork of their art thoroughly, and this knowledge was the cause of the purity, dignity and good proportions of their designs. There is much talk at times of Palladio, Michel Angelo and other old masters, but I wonder how much the average architectural student really knows of any one of them?"

Severe and systematic courses of tuition exist abroad. In France we have the Ecole Nationale des Beaux-Arts. In Italy there is the Academy of St. Luke, and Germany possesses a number of excellent training schools; all the foregoing establishments being under the control of their several Governments. In the universities, colleges and technical institutions of America there are some half-dozen or more first-class training departments in architecture, which have now reached such efficiency that their students are ceasing to go to France for the purpose of study. And the best American architects are often university graduates to begin with. All these countries have felt that the interests of the community and the State demand the efficient education of the student of architecture.

Where is the architectural student, who lives within the area embraced by this Society, to receive his training? According to our memorandum of association, the first object for which our Society exists is "to afford facilities for the study of architecture." Let us consider in what measure we have justified our existence in this respect. As you will have seen to-night, we offer prizes for measured drawings, design, construction, essays and sketching. All this is very good in its way, but is far from approaching that complete system of training and education with which we hope to see our future confrères equipped, and we feel that we have much to accomplish before we fulfil our mission. In furtherance of this, I had the honour to propose in July last the following resolution, which was unanimously passed by your Council, viz. "That the Leeds and Yorkshire Architectural Society take the necessary steps to found a school of architecture, to be conducted under its auspices and patronage, to afford facilities to Associates for the study of architecture." Your Council also considered the following suggestions, viz.—"The name of the school to be 'The Leeds and Yorkshire School of Architecture.'"

The objects for which the school is established are:—(1) To afford facilities for the study of architecture. (2) To assist students to fit themselves for their work as architects. (3) To assist students in passing the examinations which qualify for studentship and associateship of the Royal Institute of British Architects. "The students to be under the direct control of a thoroughly qualified architect as master, who shall be nominated by the Council of the Leeds and Yorkshire Architectural Society. Students wishing to join the school to be first registered as 'student of the Leeds and Yorkshire Architectural Society.' After payment of the fees for the first year's course, students to be eligible as associate members of the Leeds and Yorkshire Architectural Society without payment of the usual entrance fee, and as associate members they are to be eligible to compete for the prizes and studentships offered by the Society. Curriculum to be based upon that of the Architectural Association of London."

Your Council realised that this resolution could not be put into immediate effect, that it would therefore be some time before the proposed schemes could be fully carried out, and still keeping before them the accomplishment of their aims and

ambition, cast about to provide our students with facilities as nearly approaching our ideal school as present circumstances will permit. They approached the Leeds Institute with a view of ascertaining whether that Institution would, with the assistance of this Society, extend the existing facilities for architectural training. The response was most encouraging. The committee of the Institute signified their willingness to co-operate with this Society to the extent of accepting the following proposals, viz. "A room to be set apart for the sole use of the students of the school. The master to be nominated by the Council of the Leeds and Yorkshire Architectural Society. A representative of the Council of the Society to have a seat on the committee of the institution. Members of Council of the Society to be received as visitors to the classes. Prizes and studentships offered by the Society to be competed for by Associate students. The minimum amount to be expended on the above by the Society to be agreed upon." By these arrangements we have at least achieved that which, I venture to think you will agree with me is the nearest approximation to the spirit of the resolution; and, gentlemen, it is most gratifying to me to be able to inform you that when the new buildings are completed there will exist in the city of Leeds a school of architecture which should justify its title.

### HONEYCHURCH.

AN appeal has been issued by the Bishop of Crediton on behalf of the preservation of one of the most ancient and most interesting churches of the diocese of Exeter, that of Honeychurch. This edifice is one of the few Early English churches in Devonshire (perhaps the only one) that was left almost untouched by the church builders and church restorers of the fifteenth and sixteenth centuries; and consequently we have here surviving till to-day, but in imminent danger of absolute destruction, a building with some of the most beautiful and most interesting specimens of the ecclesiastical architecture of the twelfth century, and some perhaps even earlier. One of the most eminent ecclesiastical architects speaks in terms of very high praise of the architectural features of the fabric, and points out that long neglect and the natural decay incidental to extreme antiquity combine to render it certain that the fabric will fall to ruin if not immediately taken in hand. The Early English arch between the chancel and the nave, which is of special architectural value, has cracked and parted by reason of the outward pressure of the roof. The committee has taken on itself the responsibility of giving orders for the immediate restoration of this arch—as also for the strengthening by temporary wooden supports of the beautiful tower, which is bulging and showing signs of falling. The area and population of the parish are both very small, and the people extremely poor. A comparatively small sum would suffice to put this little architectural gem into a condition of safety. With this end in view an account has been opened at the National Provincial Bank of England at Okehampton, and the smallest subscriptions will be thankfully received.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE opening meeting of the forty-fifth session of the Edinburgh Architectural Association was held in the Association's rooms, 117 George Street, on the 5th inst., Mr. A. Hunter Crawford, the president, in the chair. It was resolved that a communication should be sent to the town clerk, suggesting that the architectural profession should have an opportunity of submitting designs in competition for the proposed Usher Hall. The Chairman intimated that the Association had become affiliated with the Royal Institute of British Architects. Mr. Crawford, in the course of his presidential address, said that in one branch of activity their Association was wanting—they had no work classes or studio. Since the school of applied art was begun their work classes had been discontinued, as it was felt that as long as that school provided good teaching under the immediate control of architects, that anything their Association could do would be a hindrance rather than a help. They were unanimous in acknowledging the excellence of the architectural education supplied by the school of applied art, especially in draughtsmanship and knowledge of style, and architects had seen the results in their own assistants, and the marked success of its students (out of all proportion to their numbers) were known to them all. Could they rely on this school being continued on the same lines as hitherto, with a prospect of its development to include all the teaching necessary for the full education of their students, they could wish for nothing better; but this was improbable, everything pointing to the early closing of the school, or, at any rate, its removal from the direct control of architects engaged in the daily practice of their profession. So soon as the school lost touch with practising architects they might look for a falling off in

results. There might be more passing of examinations, more leaving certificates granted, more academic teaching, but the results, so far as providing the students with ability to design and knowledge to construct, would be found to be meagre in the extreme. He asked the architects present what weight they gave to South Kensington certificates of honours in building construction when engaging an assistant? Was it not almost invariably found that knowledge acquired to pass these examinations was of little use when the student was brought face to face with a single piece of real building construction? Book learning was only an infinitesimal part of the education of an architect. It was absolutely essential, geniuses excepted, that the education should be given, or, at least, directly controlled by architects in the active practice of their profession. In his experience in this country he had not seen great results from the professional or University teaching of architecture, while everything pointed to the good that was done by teaching it in a school where practically the whole of the teaching was given by architects in active practice. In any reports he had seen regarding proposed changes in art education in Edinburgh no one had taken up a strong position in this matter, which he believed to be the most important in the whole question. It was the principle which was adopted at the inauguration of the school of applied art. On the motion of Mr. Thomas Ross, of Messrs. Macgibbon & Ross, seconded by Mr. Daniel Macfie, Mr. Crawford was cordially thanked for his address, and the proceedings terminated.

### VAUXHALL BRIDGE.

AT the meeting of the London County Council on Tuesday Sir W. Collins presented a petition from the Royal Institute of British Architects in reference to Vauxhall Bridge, expressing the earnest hope that the erection of a stone or granite bridge, as originally contemplated, might yet be found possible. The petitioners desired to impress upon the Council the vast importance of such a structure as a great architectural memorial of our time and of twentieth century art. A bridge across the Thames had an architectural value to the City hardly second to that of our great monumental buildings. The Council of the Institute had been favoured with an opportunity of inspecting the new design for the proposed steel bridge with ornamental facings and parapets in cast-iron carried by granite piers. While expressing no opinion on the engineering questions involved, the Council of the Institute felt it their duty to point out that there was a total lack of any artistic quality in the ornamental portions of the design. They remained of the opinion so often expressed by them that in dealing with great architectural monuments, which in their simplicity of form relied only upon competent artistic treatment for their monumental success, it was essential to adopt a system, common in other countries, of associating an architect with the engineer. They had no hesitation in saying that if the scheme of the pseudo-Gothic type illustrated should become a reality it would remain a discredit to the art of the century, to the London County Council and to all connected with its inception.

The petition was referred to the bridges committee.

### GENERAL.

**His Majesty** has invested Chevalier de Martino (marine painter to the King) with the insignia of the Third Class of Commander of the Royal Victorian Order.

**The South Kensington Museum** has recently received an accession to its exhibits of antique silver plate on loan from Mr. H. D. Ellis, comprising a series of fourteenth, fifteenth and sixteenth-century spoons, a series of candlesticks of the seventeenth and eighteenth centuries, especially illustrating the application of the gadroon ornamentation.

**The Woking School Board** have approved of the project of a public library for the parish.

**The Arts Club** gave a dinner on Tuesday last at the Prince's Restaurant to celebrate the Coronation knighthoods conferred on three of the members:—Sir E. A. Waterlow, Sir Isambard Owen and Sir William Emerson.

**Osborne House** has been visited by officials from the Office of Works. In order to carry out the plan of dividing a considerable portion of the building into suites of apartments for naval and military officers, their wives and families, or widows and families, extensive alterations will have to be made of the interior of the building. This will include the erection of extra staircases leading to the bedroom floor, and the Council Chamber will be divided into two.

**The Model** by Mr. John Hughes, R.H.A., has been adopted for the memorial statue of the late Queen Victoria which will be placed in Leinster Lawn, Dublin. Mr. Hughes's model represents the late Queen enthroned and surrounded by groups of symbolical figures. The materials of the memorial will be Irish limestone, bronze and statuary marble.

**Mr. A. J. Bolton**, architect, has prepared plans, which have been passed by the County Council, for a building con-

taining 270 bedrooms, a large dining-room, billiard-rooms, reading-room, library, and a large hall in the basement for gymnasium, concerts, &c. The site is at Stockwell, and a company has been formed to raise the capital of 35,000*l.* with the title Ingram Houses, Ltd.

**Mr. Carnegie** has purchased two cottages adjoining Shakespeare's house, Stratford-on-Avon, in order to minimise any risk of an outbreak of fire.

**The Voting Returns** from the joiners of the North-East circuit have been received. There was a large majority against the employers' proposals, who asked the men to resume work immediately at 1*s.* a week reduction, the other 6*d.* to be submitted to arbitration. The men had previously offered to accept 6*d.* a week reduction, which the employers refused to accept. The employers originally asked for a reduction of 1*s.* 6*d.* weekly.

**A Memorial Chapel**, to be known as the King's Own Memorial Chapel, is proposed to be erected on the north side of the Lancaster parish church at a cost of 3,000*l.*, to the memory of the officers and men of the King's Own Royal Lancaster Regiment who fell in the war. The requisite authority has been given for the vicar and churchwardens to apply for a faculty to carry out the work. Five new windows available for memorial glass will be provided.

**The New Nave of Truro Cathedral** is expected to be completed in May next, and a committee has been appointed to make arrangements for a grand formal opening. The choir and transepts were consecrated in 1887, and part of the nave has been in use for some time. The principal portion of the work yet to be accomplished is the groining of the aisle. No further cracks have appeared in the bases of the pillars nor any serious signs of settlement.

**The Association of Waterworks Engineers** will meet at the Geological Society's Rooms on December 6, when papers will be read on "The Coating of Cast-Iron Pipes," "The Softening Plant of the Stockport Corporation Waterworks" and "The Detection and Prevention of Underground Pollution."

**The Public Works Department** of the Transvaal Government in Johannesburg have secured the services of Mr. T. N. Cormack and Mr. J. L. Peddie, architects, both of whom were engaged in Messrs. Dunn & Findlay's office, Edinburgh, and held scholarships of the School of Applied Art.

**Forest Fires** in the United States are, according to a bulletin issued by the Bureau of Forestry at Washington, costly. In an average year sixty persons perish, 25,000,000*dols.* of real property is destroyed, 10,724,000 acres of timber land burned over, and young growth estimated at 75,000,000*dols.* rendered useless.

**The French Chamber** has sanctioned an agreement by which the Paris Municipality becomes owner of the site of the Gallery of Machines erected, at a cost of 7,000,000 francs, on the Champ de Mars for the Exhibition of 1889, with the right, and indeed the intention, of demolishing it or possibly of re-erecting it on another site.

**The Parliamentary Inquiry** into the applications of the Glasgow Corporation for power to purchase by agreement 50 acres of land either within or beyond the city, and to borrow 750,000*l.* for the purpose of providing houses for the poorer or labouring classes, has closed. The application was greatly opposed. The decision of the Commissioners is as follows:—"The Commission finds the preamble of the order, so far as applicable to the acquisition of additional land, not proved, but in order to enable the Corporation to complete the purposes of section 12 of the Act of 1897, the Commission is prepared to sanction additional borrowing powers not exceeding 150,000*l.*, and the imposition of such assessment as may be necessary to meet the same." Clauses were afterwards adjusted in accordance with the decision.

**The Late James Tissot**, the painter, has bequeathed to the Louvre his pictures of *The Prodigal Son*, while his engravings are to go to the National Library and to the Nantes and Besançon museums.

**The Opening Meeting** of the one hundred and forty-ninth session of the Society of Arts will be held next Wednesday evening, when an address will be delivered by Sir William Henry Preece, K.C.B., F.R.S., chairman of the Council.

**Sir Walter Armstrong**, director of the National Gallery of Ireland, will deliver the Hermione lectures in Dublin this year. The subject selected will be "Portraiture."

**Mr. James Guthrie, R.S.A.**, has been unanimously elected as president of the Royal Scottish Academy. He has been an Academician since 1892.

**The Chateau d'Eu** was the scene of a fire on Tuesday. Three of the four wings have been destroyed. It was visited by Queen Victoria in 1843 and 1845.

**A Paper** will be read by Mr. Otis D. Black before the Liverpool Architectural Society on next Monday evening. The subject is "A Holiday in Normandy."

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

ASHTON-IN-MAKERFIELD.—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgwater.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

DURBAN (NATAL).—Dec. 18.—Designs are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

ECCLES.—Dec. 12.—Plans are invited for the laying-out of an area of land and for erection of dwellings for the working-class on part of such area. Premiums of 50*l.*, 30*l.* and 15*l.* will be awarded in respect of the plans placed first, second and third in order of merit. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

HOLYHEAD.—Dec. 2.—Sketch designs are invited for schools and a teacher's house. The competitor whose designs and terms are approved and accepted by the Board will be appointed the architect. Mr. R. E. Pritchard, clerk, Holyhead.

HULL.—Jan. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

ILKESTON.—Nov. 28.—Competitive plans for a mixed junior school to be erected in Bennerley Street are invited. Particulars may be obtained from Mr. Wright Lissett, Town Hall, Ilkeston.

SCOTLAND.—Nov. 29.—The Arbroath Golf Club invite competitive plans for a new golf club-house at Elliot. Mr. William Alexander, secretary, 62 High Street, Arbroath.

Wood & Co., Ltd., Imperial Buildings, Ludgate Circus.

WEALDSTONE.—Nov. 18.—For street works in Hindes Road. Mr. F. Hill Parr, surveyor, Council Offices, Wealdstone, Middlesex.

WEST HAM.—Nov. 25.—For street works in Glasgow Road, Tweedmouth Road, Stirling Road, Dundee Road, Edinburgh Road, Southern Road (part). Mr. John G. Morley, borough engineer, Town Hall.

WEST HARTLEPOOL.—Nov. 19.—For supply of kerbstone, flags, paving settle, road stone, pitch and tar, lime, sewer pipes, metal castings, cement, disinfectants, picks and shovels, scythes, brushes, oils, firewood, sawdust, general stores, &c. Mr. Brown, borough engineer, Corporation Depot, Stranton.

### MANCHESTER ELECTRICAL ENGINEERS.

A MEETING of the Manchester section of the Institution of Electrical Engineers was held on Tuesday evening at the physical laboratory of the Owens College. Mr. E. W. Cowan, vice-president, was in the chair, and Mr. W. Francis Goodrich, of London, read a paper on "Electricity from Refuse: The Case for the Modern Destructor." The object of the paper was to show that cremation of refuse and really efficient power production were compatible and could be coincident. Out of a total number of 165 towns in Great Britain where destructors had been adopted, said the lecturer, 45 towns had decided to combine the destructor with the electricity works; and the actual destroying capacity of the destructors adopted in combination with generating stations might be put at upwards of 1,400 tons daily. Forty and even 50 units had been generated per ton of refuse destroyed over short periods. At Darwen, over a period of a year, 33 units had been generated per ton of refuse destroyed, and at Shoreditch, over a similar period, 20 units. Sufficient data was available to show that, with a well-designed and well-managed plant, at least 30 units per ton of refuse burned might safely be relied upon the whole year through. There had been a number of instances where for a certain period the whole of the power required had been obtained from the refuse, but this happy state of things was exceptional, and experience showed that the refuse-destructor was but a most useful adjunct to a generating station. Mr. Goodrich, who showed a number of lantern-slides in connection with his lecture, was warmly thanked at the close.

## TENDERS.

### BILDESTON.

For erection of a classroom to the Nedging and Naughton Board school (U.D.).  
J. H. Castle . . . . . £180 0 0  
J. DEATH & SON, Bildeston, Ipswich (accepted) 149 0 0

WALES.—Nov. 27.—For renewals and repairs to the Cogan pumping-station's engines and boilers, Cardiff. Mr. C. H. Priestley, waterworks engineer, Town Hall.

# WAPICTI

A SANITARY  
WASHABLE DISTEMPER  
OF BRITISH MANUFACTURE.

PRODUCES A MUCH MORE PLEASING EFFECT THAN FLATTED OIL PAINT, AT ONE THIRD THE COST.

"WAPICTI" can be made in any Tint, and is adapted for application to Plaster, Stucco, Brick, Stone, Cement, Wood, &c.  
FOR INSIDE OR OUTSIDE WORK.

"WAPICTI" may be used over Oil Paint, or Oil Paint may be applied over it.

Manufactured by **ASPINALL'S ENAMEL, LTD.** New Cross, London, S.E.

# NEW CATALOGUE.

WE have received from Messrs. Alfred Walker & Son, of 7 Upper James Street, Golden Square, W., and Leeds, a catalogue setting forth particulars of their Granitic-stone pavements, concrete steps and landings, fireproof floors, &c., and containing also a list of contracts they have carried out in various parts of the country, which, while not a complete one, is certainly imposing, and represents an enormous amount of work satisfactorily executed, as may be gathered from the fact that in all cases the architects have given permission for their names to be used as references.

The work done may be divided into different sections:

FIG. 1.

FIG. 2.

Firstly, pavings, playgrounds, carriage drives, stable floors, &c.; secondly, fireproof floors, staircases and corridors and the fireproofing of girders, beams and columns; and thirdly, plain and moulded window sills and heads, copings, plain and moulded steps, sinks, &c. Among the more important contracts carried out by Messrs. Walker & Son we may mention that of

the pavings and staircases erected at the new buildings of the Prudential Assurance Company, Holborn Bars, Messrs. Alfred Waterhouse & Son, architects, the concrete steps being made with their patent tread, which we illustrate, fig. 1 being a part plan and fig. 2 the section. This is a very useful, clean tread, made in casting the step; it affords a better foothold and improves the appearance, taking away the plainness of the steps, and may be recommended for use in all staircases. It has been adopted for various branch buildings of the Prudential Assurance Company at Bristol, Plymouth, Hull, &c.; also at the London Hospital, new hospital Maida Vale, Enmore Castle, Messrs. Peter Robinson's premises, and many other places. Where specially ordered, however, the concrete steps are fitted with wood, rubber, or mosaic treads. Other work in hand or recently completed by this firm comprises steps (over 1,100), landings and pavings for Leeds Central Estate Buildings; fireproof floors and pavings for Yorkshire College and the new Leeds Markets; Empire Palace, Leicester; Empire Hotel, Buxton; St Paul's Schools, Hammersmith; at the nurses' home and new cancer wing, Middlesex Hospital; and fireproof staircases at the London Hospital, Whitechapel (outpatients' department).

For the Liverpool School Board they have supplied over 40,000 superficial yards of paving to playgrounds, about 35,000 superficial yards for the Leeds School Board, and over 15,000 superficial yards paving at Hôtel Majestic, Harrogate.

Pavements have been laid in London for the Marylebone Board of Works, and for the Corporations of Leicester, Birmingham, Liverpool, Oldham, Newark, Dublin, Drogheda, &c.

Among the work executed for stable paving we notice that Messrs. Walker & Son have laid at Curragh Camp, Ireland, for the War Department over 20,000 yards, in addition to that at Norwich, Ipswich, and Colchester, and for the Midland and other railway companies in various towns.

We have said sufficient to show the extent of the operations of this firm, which has been established since 1861, and the reputation they have maintained throughout that long period is sufficient guarantee that all work undertaken by them will be carried through in a satisfactory manner.

THE Pontefract Guardians have approved a scheme of workhouse extensions which will involve an ultimate expenditure of 30,000*l*. Only a portion, to the extent of 10,000*l*, is to be proceeded with at present.

## JENNINGS' PATENT

## TRADE NOTES.

JOHNSON HALL, Eccleshall, has recently been fitted with the latest improved hot-water heating apparatus by Messrs. John King, Limited, engineers, Liverpool, employing their "Rahnee" radiators and "Rex" radiator valves.

THE Cherry Tree Machine Company, Ltd., engineers and ironfounders, Cherry Tree, near Blackburn, inform us that they have secured the contract for the installation of a "Reck" disinfecter, boiler, &c., at the hospital, Garden Walk, Royston, Herts, for the Royston, Ashwell and Melbourne Joint Hospital Board.

MESSRS. HOMAN & RODGERS, engineers, of Marsden Street, Manchester, have secured contracts for the concrete fireproof floors and constructional steelwork to the Haxby Road and Poppleton Road schools for the City of York School Board; also the new nurses' home, County Hospital, York.

## ELECTRIC NOTES.

A PROPOSAL by the lighting committee of the Ayr Town Council to light the Esplanade by alternative schemes has been submitted. The one provides for the erection of sixteen arc lamps at a cost of 582*l.*, and an annual cost of 96*l.*, and the other for thirty-two pairs of incandescent lamps, each pair of 64 candle-power, and an annual cost of 115*l.* The electrical engineer recommended the arc lamps. The schemes were remitted to the committee for a report.

A MANCHESTER syndicate has been formed to apply for Parliamentary powers to erect electric generating stations and lay mains for the supply of electricity and power gas throughout a district comprising the county of Chester, the greater part of the county of Flint, the Wrexham district of Denbighshire, North Staffordshire, &c., a total of some 2,000 square miles, with a population of over 1,500,000. At a meeting of the Holywell Rural District Council a letter was read from Messrs. Rowcliffe & Co., solicitors, Manchester, the solicitors to the syndicate, expressing a hope that the Council would co-operate and help in the undertaking, which could not fail to be of great benefit to the district, and place it on a par with other districts. Several members said they should do all they could to further the scheme.

THE Post Office has been able to announce to the Associated Chambers of Commerce that the underground mains from Stafford to Warrington for the new telegraph cables are quite complete, and that the cables were ordered some time ago, and will all be laid very shortly, some being already down, so that probably by the end of the month underground wires between London and Manchester and London and Liverpool will be complete. A section of the main between Kendal and Shap has also been laid, but the wires will not be put down this year, unless it is necessary for temporary purposes to slip in four guttapercha covered lines. Mains are laid, too, between Preston and Preston Richard, a point about 10 miles north of Lancaster, and the cables are almost completed on this section.

Two schemes for the development of electric traction in the neighbourhood of Edinburgh have been submitted to the Town Council as a preliminary to Parliamentary sanction being sought. One proposal is for the formation of a company, and the construction by it of a tramway from the city of Edinburgh to the burgh of Queensferry. It is intended to run a tramway from the west end of Princes Street along Queensferry Road to a point in the burgh of Queensferry opposite the milestone marking eight miles from Edinburgh. The line will be worked by electricity, and probably the promoters will be able to arrange with the city of Edinburgh for a supply of electric power. Messrs. Blyth & Westland, C.E., George Street, Edinburgh, are the engineers, and Messrs. Drummond & Reid, W.S., of 21 Charlotte Square, are the solicitors in the matter. The provost, magistrates and Council of Queensferry unanimously approved of the proposal, and recorded their hope to have the line constructed as speedily as possible. The other scheme is one which has been previously before the Council. The Drake and Gorham Electric Power and Traction (Pioneer) Syndicate, Ltd., London, have written to the Edinburgh Corporation offering to enter into a friendly arrangement with the Corporation by which the gap now existing between the Musselburgh Tramways Order and the Edinburgh Corporation system could be bridged over, and that they would be prepared, if they were to get the support of the Council, to apply for a new tramway order in respect of this intervening gap. They would be prepared to enter into any reasonable agreement with the Corporation either for the transfer of the Order to the Corporation, upon terms to be agreed, or agreeing to sell the lines within the city boundaries to the Corporation when constructed, upon

### VARIETIES.

THE opening of the free library and public hall provided for the village of Steeple Claydon, in Buckinghamshire, took place on the 8th inst. The block of buildings have been erected at a cost of about 1,700*l.*, exclusive of the furniture, fittings, &c., and stands in an elevated position at the top of the village.

LORD REAY (chairman of the School Board for London) formally opened the new higher-grade school which has been recently erected by the Board in Gassland Road, South Hackney, on Tuesday evening. The building, which has cost over 30,500*l.* (exclusive of site), contains accommodation for 816 boys and girls.

THE Bishop of Burnley has dedicated new vestries which have been built at All Saints Church, Habergham, Burnley. The buildings have cost about 320*l.*, and include a large vestry for the choir, a considerable addition to the clergy vestry, and a room for the accommodation of an electric motor to blow the organ. Further improvements in the church are contemplated.

SIR JOHN AIRD, BART., M.P., has arranged to leave London for Egypt on Tuesday next, in order to attend the formal opening by the Duke of Connaught, on the 10th proximo, of the Great Nile reservoir and dam at Assouan. The invitations to the ceremony, numbering about 400, will be issued by the Egyptian Government, and the guests will probably travel to Assouan in river boats.

THE old and historic Cloth Hall of Newbury, Berks, has been carefully restored as a memorial to Her late Majesty Queen Victoria, and was opened on the 7th inst. as the Victoria Museum and Art Gallery. The restored hall stands near the Market Place, and at the entrance to the spacious Corn Wharf, where there are other quaint timber-built corn granaries, to which use the Cloth Hall had long been devoted, after it had ceased to be utilised for its original purpose. Affixed to the front of the building, facing the Market Place, is a memorial-stone with the following inscription:—"This antient Cloth Hall

was repaired by public subscription as a memorial to Queen Victoria. Ano. Dom. 1902."

A MEETING of the Council of the Institution of Civil Engineers of Ireland was held at 35 Dawson Street, Dublin, on Monday, when the following were present:—Messrs. J. H. Ryan, president (in the chair); R. Cochrane and W. Ross, vice-presidents; William Anderson, James Dillon, Frederick J. Dick, M. Ruddel, R. O'B Smyth, Professor Pigot, W. H. Mills. A quantity of routine business was transacted. A general meeting was held at 8 p.m., when the President occupied the chair. A report was read from Mr. W. R. Maguire, associate, the Institution's delegate to the recent Sanitary Congress at Manchester, the discussion on which was postponed until next meeting in December. A ballot for candidates resulted in the election of Mr. Henry Browne as associate member, and Mr. George Browne as associate.

ST. ANNE'S Institute, Birkenhead, in connection with St. Anne's parish church, was opened on the 10th inst. There is a hall about 54 feet by 30 feet and 18 feet to ceiling, with a gallery at one end and three classrooms adjoining, 20 feet by 18 feet each, the whole of which can be thrown into one room to accommodate about 400 people on the ground floor and about eighty in the gallery. There is a gymnasium at back 50 feet by 18 feet and 19 feet high in centre, with a kitchen between it and hall for teaching cookery. The hall has two cloak-rooms at front and two retiring-rooms and platform or stage at the other end, with space under for storing of forms and chairs. The heating is by hot water from boiler in basement. There is a playground at side of about 165 superficial yards, with the necessary conveniences. The whole has been built substantially with bands and dressings of terra-cotta and red brick by Mr. James Merritt, builder, of Birkenhead, under the supervision of Mr. James N. Crofts and Mr. Charles Wise, of Liverpool, who have acted as joint architects. The cost of building was about 2,400*l.*

### BUILDING AND BUILDERS.

AT the last meeting of the Driffeld Board of Guardians, plans prepared by Mr. Joseph Shepherdson were laid before the Board for an enlargement of the workhouse infirmary at a cost of about 3,000*l.*, and, after some slight discussion, adopted.

Vol. LXVII. of THE ARCHITECT. Handsomely bound in Cloth. Price 12s. 6d.

**SATISFACTORY** progress is being made in the rebuilding of the Wesleyan Centenary House in Bishopsgate Street, London, the headquarters of the Wesleyan Foreign Missionary Society, and the work is expected to be completed by about this time next year. The former structure, once well known as the London tavern, was purchased in 1839 to commemorate the centenary of the founding of the Wesleyan Methodist Connection, and the trust deed provides that a building shall always exist there as a memorial of that event.

The special committee appointed by the Clyde Trust to consider the improvement of the river and harbour met on Monday and resolved in favour of widening and deepening the river in order to meet the requirements of local shipbuilders, who had been invited to tender for the new Cunarders. The work will be entered upon at once, and will occupy close upon two years. When it is completed the largest type of vessel, warship or other, will be able to navigate the river.

An inquiry was held in Glasgow on Monday, the 10th inst., as ordered by the Secretary for Scotland, into the provisional order sought by the Glasgow Corporation to empower them to purchase fifty acres within or without the city boundary with a view to erecting houses for the poorer and labour classes. The scheme provided for borrowing 750,000*l.* After hearing the evidence, the Commissioners declared the preamble had not been proved, but granted borrowing power up to 150,000*l.* to carry out the present scheme.

At a special meeting of the members of the Bradford School Board tenders to the amount of 28,700*l.* were accepted for the erection of a school in Grange Road, Horton. The Rev. R. Roberts asked if the contractors whose tenders had been accepted were all paying the standard rate of wages. Mr. Priestman: They have all to sign our rule to that effect before we let the contracts. The Rev. R. Roberts: May I take it that such signing will be binding upon them? Mr. Priestman: It is as binding as it possibly can be.

The borough treasurer of Southport has reported to the finance committee that the proposed expenditure of 14,000*l.* by the improvement committee on the improvement of Nevill Street, setting back the pier entrance, paving the footpaths and roadways, &c., would, provided the Local Government Board granted a loan, subject to twenty-five years' repayment, involve an annual charge of 873*l.* for interest and sinking fund. This is rather more than a halfpenny rate. At to-day's meeting of the Town Council it is anticipated the improvement committee will be asked to modify their estimate.

At a special meeting of Grangemouth, N.B., Town Council, held to consider a new water supply, two schemes were put forward, one in connection with the Stirlingshire Eastern District committee, which would cost the burgh 38,000*l.*, and one from the Bannock Burn, which with a 10-inch pipe track and reservoir would cost 51,000*l.*, and if a 12-inch pipe track were laid the cost, including reservoir, would be 62,800*l.* The meeting adopted the large scheme, which will require an assessment rate of 2*s.* 1*d.* per 1*l.* for capital expenditure and working expenses.

At Newport (Mon) Ald. Davis, the retiring mayor, laid the foundation-stone of the western anchorage of a transporter bridge. In order to provide means of connecting the eastern and western banks and yet not interfere with the river traffic, the Newport Corporation decided upon a transporter bridge. At the point where the bridge is to be erected the Usk is 750 feet wide, and from open latticework steel towers a girder suspended by steel cables will cross the river at a height of 177 feet. Upon this bridge, with girders for rails, will run a travelling frame, from which by wire ropes a car will be suspended at the ground level. This car is capable of carrying 66 tons, including vehicles and a large number of passengers. It will cross the river in one minute by means of electric motors. The estimated cost of the work is 90,000*l.*

### A NEW TENON JOINT.

MESSRS. TRUSS & Co., of 125 Fenchurch Street, are showing an invention which should be warmly welcomed by carpenters and joiners and those interested in their work. The twin-tenon joint, as it is called, consists of a short length of lightly made double-channel iron or wood of the following section, T, which fits into grooves of corresponding section cut obliquely to the joint plane of the wood by means of a special tool, and the effect is to produce a perfect grip and rigid joining of the parts. It is extremely simple, expeditious and efficacious, and whereas wood joined by the old-fashioned methods suffers considerably from drying and shrinking, causing ugly gaps and rickety joints, by the use of the twin-tenon joints the forces producing these cracks and gaps are actually utilised to make the joints closer and firmer; for as the wood shrinks it closes around and tightens its grip upon the iron twin-tenon, thereby converting what has hitherto been an insurmountable drawback into a positive advantage.

**WORTH DRAINAGE AND SEWAGE-DISPOSAL SCHEME.**

LOCAL GOVERNMENT BOARD inquiry was held on the 31st Colonel W. R. Slack, R.E., into an application by the Rural District Council for sanction to borrow 25,000l. for a new drainage and sewage-disposal scheme for Bedworth. The clerk to the Council, explained that the necessity for a complete scheme had arisen from complaints of pollution of the river Anker by the sewage of Bedworth. Dr. Bostock, County medical officer, spoke as to the pressure brought to bear on the County Council on the Rural District Council, and that there had been several outbreaks of typhoid in Bedworth, and that until an efficient sewage-disposal scheme was carried out it was impossible to minimise many of the evils mentioned.

C. Nicholson Lailey, of Westminster, who had been consulted by the Council, described the scheme, which includes the laying of 10 miles of sewers. Mr. Lailey suggested that as the site of the outfall works is clay, the Local Government Board should be asked not to insist upon the purchase of land on which to irrigate the filtered effluent.

The purification scheme adopted embodies the most modern and efficient bacterial oxidation—beds which will be supplied by the Candy Whittaker automatic revolving sprinklers. This type of bacterial bed has been proved to effect over 99 per cent. of bacteriological purification as well as to produce effluent that is chemically of the highest class.

Lailey, in reply to inquiries, said the scheme he had proposed for them was the cheapest, and to his mind the best that could be carried out. The Inspector stated that the Council were acting under high expert advice, and that the medical officer, Dr. Bostock Hill, who had great experience in these matters, concurred in the scheme.

**LIVERPOOL CATHEDRAL.**

A general committee of the proposed Liverpool Cathedral was formed on the 12th inst., under the chairmanship of Lord Derby. It was reported that the subscriptions promised amounted to 156,017l. 9s. 6d., of which 80,812l. 18s. 5d. had already been received. Lord Derby reviewed the highly successful efforts of the executive committee, and explained the provisions of the Liverpool Cathedral Act, which contained

provision for substituting the chapel of St Nicholas for the church of St. Peter as the parish church of Liverpool at or after the opening of any portion of the cathedral for Divine service. The scheme, his lordship said, had been taken up in a large and generous spirit, and though they would have to ask later on for further funds, he was one of those who thought that they would require to establish their position still further before they made any wide or general appeal for funds. The Lord Bishop of Liverpool (Dr. Chavasse) complimented the executive committee on the manner in which they had carried out their duties, and remarked that endless suggestions and criticisms which had been sent in had been considered by them. Mr. Robert Gladstone mentioned that 103 drawings were received in the preliminary competition for the cathedral design, and this number had been reduced to five. The time for the final competition to be sent in had been fixed for April 30 next. Sir William B. Forwood, the chairman of the executive committee, thought that the foundation-stone of the cathedral ought not to be laid until they were sure of 200,000l.—45,000l. more than was at present promised. A cathedral worthy of Liverpool would, in their opinion, cost probably 500,000l. Lord Derby was cordially thanked for presiding and for the interest he has all along evinced in the scheme.

**LONDON BUILDING ACT.**

JUDGMENT was given on November 6 in the case heard on October 16 of a building, No. 116 High Holborn, being over 10 squares in area and not properly separated as required by Section 74 sub. 2. The magistrate remarked that a portion of the vaults shown on the plan had been bricked up and abandoned, and were therefore not now calculated in the area of the building. Order was made to comply with requisition of district surveyor within fourteen days and pay 3 guineas costs.

A summons for neglect to comply with a notice of irregularity—London Building Act, 1894—was heard on October 16. The defendant had erected an enamelled iron advertising sign over and covering the first-floor window, obstructing all light and ventilation to a habitable room at No. 195 Shaftesbury Avenue, contrary to Section 70. The district surveyor stated that the structure had been removed and the summons was withdrawn upon payment of 13s. costs.

Both cases arose in Mr. C. F. Hayward's district.

## NEW SCHOOLS AT HANWELL.

THE new St. Ann's schools in Springfield Road, which have been erected to the designs of Mr. William Pywell, of Hanwell, are to be formally opened to-morrow (Saturday). The buildings comprise three distinct blocks; a school for boys and girls on one side and infants' school on the other, with the School Board offices and caretaker's house between the two.

They will accommodate 1,230 children in two departments, all on one storey, viz. a senior mixed school consisting of twelve classrooms grouped round a central hall, and an infants' department as a separate building.

The site on which the schools are erected was formerly known as the "Spring field," of about 2½ acres, and contained the famous St. Ann's well, which has now been drained, filled-in and covered over. The schools take their name from the saint to whom the well was dedicated.

The school for 780 boys and girls, although designated a mixed school, is not strictly so, because the upper standards of boys and girls have separate and distinct classrooms, and it is only in the lower standards that the boys and girls are in mixed classes.

The school is designed on the central-hall plan, with twelve classrooms, six on either side of the hall. Male and female teachers' rooms, stock-rooms, boys and girls' cloakrooms, lavatories, caretaker's sink and entrances are respectively provided at either end.

All the classrooms are lighted by windows to the left hand of the scholars and separated from the central hall by glazed screens.

The central hall is 72 feet long, 40 feet wide and 30 feet high at the ceiling line, and has five open hammer-beam principals supporting the roof. The hall is amply lighted by windows at each gable end and by the glazed screens at the sides. In the basement under the cloak-rooms at one end of the building are a heating chamber, coal and coke stores, a repairing shop and general store for chairs, desks and spare furniture. The floor over the basement is of fireproof construction. A subway from the basement connects the three blocks of buildings and contains all main supplies and junctions, thus facilitating inspection and repairs without breaking up the surface of the playground. The infants' school for 450 infants consists of a schoolroom 58 feet long, 24 feet wide and 18 feet high; three classrooms, each for sixty first, second and third-class infants, and a babies' department of two rooms

for Kindergarten instruction to 130 children. The teaching room and stock-room are approached from a gallery over senior infants' cloak-room and entrance. Two entrances, cloakrooms and lavatories are provided for senior and junior infants respectively, and an exit is provided immediately from schoolroom to the playground. Lavatory accommodation for the teaching staff and a wash-up sink and store for the caretakers are placed near one entrance. The babies' entrance is placed directly facing the entrance to the girls' school, so as to conveniently allow the sisters to bring and take home their small brothers and sisters.

The design of the buildings has been conceived in the treatment of Early English Renaissance. The whole of the floors are of pitch pine wood blocks. All internal walls have brown glazed brick dados; the upper part of the walls are faced with gault bricks. The schools throughout are heated by water on the low-pressure system of pipes and radiators assisted by open fires when requisite. All school and classrooms are provided with fresh air inlets, and the top lights of all windows are made to open at the ceiling level actuated by steel rods and screw gear. The vitiated air is extracted by means of ventilation flues and ceiling ventilators. The ceiling ventilators take the form of a compass marked with the cardinal points, thus in every room the north point and the aspect of the room are readily obtained and is an instructive object lesson to the scholars. The desks throughout are dual desks executed in oak. In the senior schools the three back rows of desks are raised on stepped floors. In the infants' department the desks are on the level floors, except that a gallery for the babies is arranged in a separate room. The Board's office block consists of a Board-room, clerk's office and lavatory accommodation and the caretaker's apartments of parlour, kitchen, larder, three bedrooms and offices.

The Board-room is 30 feet long, 18 feet wide and 15½ feet high to the ceiling. It is divided into three bays by two timber roof principals, with curved ribs supported on stone corbels bearing the Board's monogram on shields in relief. A painted lincresta dado with moulded skirting and capping surround the room as well as the entrance hall. At one end of the Board-room is a large open fireplace with hobs and tile linings and hearth, set within a marble chimney-piece and kitchen fender; at the other end is a large five-light stone mullion window, with transome, and glazed with leaded lights. The external walls throughout are faced with yellow stock brick with red dressings and purple-grey bands. The para-

6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON, E.C.

gs, sills and other stonework are executed in red Dumfries. The roofs of the school buildings are covered with green tiles, while the offices and caretaker's block is roofed with red tiles, which gives a domestic character to the central block, and makes a pleasing break in a large mass of roofing. The playgrounds are tar paved, and are divided mainly enclosed with brick walls, and each provided with a covered play-shed, drinking-fountain and the usual benches. Great care has been exercised in fitting up the men's out offices to insure perfect cleanliness and healthy surroundings. The contract price for the whole of the works is £1,457 17s., and the furniture £217.

### PENRITH SEWAGE SCHEME.

On Saturday night a private meeting of the Penrith Urban District Council was held at the Public Offices to consider the development of the sewage outfall scheme. Mr. Winterbottom presided. A report by the sewerage sub-committee was submitted to the general purposes committee, which met that evening. It stated that an interview had been obtained with a representative of the Local Government Board at Carlisle, and the proposed scheme for acquiring Westmorland Holme was formally abandoned. The report continued:—On October 11 Messrs. Brierley & Holt, engineers, Blackburn, were instructed to inspect and report upon other lands in the neighbourhood of Penrith suitable for sewage disposal, and after the necessary investigation, levelling and mapping, they reported that 25 acres of Whinfell Holme, the property of Lord Hothfield, is the most suitable. Consideration has been opened with the agent of Lord Hothfield (Mr. R. B. Barrett) with the view of purchasing the land, named by agreement if possible, but in order to provide for the eventuality of the failure of the negotiations, the sub-committee consider that it is absolutely necessary that the Council should be in a position to petition the Local Government Board for a provisional order in respect of such land in time for passing the Act confirming the order throughout the session of 1903. If this is admitted the Council should at once instruct the necessary steps to be taken, and statutory notices have to be advertised and plans deposited this month (November). In regard to the present use of Westmorland Holme your sub-committee have had their

attention called to a small arm of land which requires to be immediately put out of use for irrigation purposes, and in order that this may be done and the work at the Holme conducted in a thoroughly satisfactory manner during the remaining period it is in the hands of the Council, instructions have been given to lay a new drain from the precipitating-tanks to a suitable site about 173 yards distant, at an estimated cost of 70% to 80%.

On the recommendation of the general purposes committee it was resolved to instruct the Clerk to take all the requisite steps to obtain compulsory powers to purchase 25 acres of the Whinfell Holme and land for roadway thereto, and that his services in connection therewith be remunerated by such sum as the Council may hereafter fix.

### A GOVERNMENT CONTRACT.

ON September 11, 1899, Messrs. B. Graham & Sons, of Huddersfield, entered into a contract with the Commissioners of Works and Public Buildings for the erection of a post office at Stalybridge. Before the contract was completed it was determined by the Commissioners, who took possession of the unfinished work, materials and plant. The defendants justified their action under the terms of the contract on the ground that the plaintiffs had put in the roof of the sorting office joists which were not according to the specifications, and failed to remove them on the order of the architect. An action was brought at the Leeds Assizes in August 1901 by the contractors. The Lord Chief Justice held that in the circumstances the defendants' architect had not adjudicated on the quality of the timber himself, but had delegated this duty to the clerk of the works, and that as the architect's adjudication was a condition precedent to the defendants' right to terminate the contract, gave judgment for the plaintiffs. From this decision the defendants appealed. There was also a cross appeal by the defendants, who contended that the learned judge was wrong in not leaving to the jury the question of whether or not the defendants had waived their right to terminate the contract. In the Court of Appeal the case was heard by the Master of the Rolls and Lords Justices Romer and Mathew.

The Solicitor-General said that shortly the question really came to this, whether the defendants' architect, who had certain powers under the contract, had adjudicated on certain defaults of the builders, which adjudication was a condition

## CABOT'S INSULATING & DEAFENING QUILT.

### A PERFECT DEAFENER.

It stops the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. See Special Book on Schoolhouse Acoustics, illustrated.

### A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay proof, moth, and vermin-proof, and unflammable.

### FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

### CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

## CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Called for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

## THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

precedent to the defendants having power to determine the contract and to enter into possession of the works themselves. As far as he could see the whole judgment of the learned Lord Chief Justice turned upon that one question. The learned judge held that there was no evidence of adjudication by the architect at all, and that therefore the Commissioners had no right to terminate the contract. There was a special jury, but his lordship thought there was no question for their consideration. The Court would see that in one view of the case there might be a question which ought to have been left to the jury, but at an early stage in the proceedings the Lord Chief Justice said he would not allow evidence on the question as to whether there was in fact default by the builders to be submitted to the jury.

The Master of the Rolls said the first question to be decided was whether the architect had acted in accordance with the terms of the contract, so as to justify the defendants in determining the contract. If the Court should be of opinion that there was a consummated forfeiture, then there arose a second question of whether the defendants had waived their right to exercise that forfeiture. As to the first point, the Lord Chief Justice had held that the architect had not adjudicated on the matter, in that he delegated the duty of inspection to his clerk of works. By the terms of the contract the architect could order the removal of any materials used in the building that "appeared to him" not up to the specified quality. The plaintiffs' contention was that that being so he must himself examine and decide upon what particular timbers were not up to quality. What the architect actually did was to examine the wood on the ground, and finding that it was not of the required quality direct the clerk of the works to mark the timbers already put in the roof of the sorting-house to which he objected. Upon that gentleman's report the architect framed his certificate, and the question was whether in these circumstances the architect could be said to have adjudicated on the matter. It was perfectly obvious as a matter of business that one could not expect an architect to go into every detail himself. He (the Master of the Rolls) had no hesitation in holding on the authorities that the architect, having himself first ascertained that the timber being used was not of the stipulated quality, was perfectly entitled to delegate the duty of particularising which of the timbers had to be removed. That being so, the defendants had the right to terminate the contract, if they had not waived their right of doing so. His Lordship added that a cross appeal had been

made by the contractors, who contended that in respect of forfeiture a more than reasonable time was allowed to elapse before the certificate of the architect was obtained. That was a point which would involve the consideration of facts, and it seemed to him that the judge was not justified in withdrawing the matter from the jury. The case would therefore have to go back to the jury to have that point decided.

Lords Justices Romer and Mathew concurred.

### DEEPENING THE THAMES.

IN May last the engineer of the Thames Conservancy was instructed to report upon the cost of deepening the navigable channel of the river between London Bridge and the entrance to the Millwall Docks. After consideration of his report, which was presented in June, the Conservators have determined to dredge the river, so that there will be a depth of water at lowest spring tides of 14 feet between London Bridge and the Thames Tunnel, the channel being 200 feet broad, this being the greatest width possible, owing to the tiers. Below the Thames Tunnel the depth will be increased to 16 feet in a channel 300 feet wide. The cost of this work is estimated at 54,000*l*. At present the depth of the river above the Thames Tunnel is in some places no more than 10 feet 6 inches at low tide, owing to silting up. In this part of the channel a greater depth than 14 feet is not practicable, because there is only 13 feet over the roof of the tunnel, and as the Commissioners on the Port of London point out in their report, a certain thickness of soil must be left above the top of the tunnel, which consequently must render of little practical use any deepening of the Pool further than that which is now to be undertaken by the Thames Conservancy.

### GERMANY AT THE ST. LOUIS EXHIBITION.

THE official decision of Germany to take part in the Universal Exposition to be held in St. Louis in 1904 has long been assured. The delay in making the announcement has been due wholly to the exigencies of the domestic situation and to the depression in business prevailing during the past two years. In fact, after the visit of Prince Henry to St. Louis, the tender by the Emperor of a statue of Frederick the Great

city of Washington, and the changed attitude towards the doctrine recently apparent, participation on large lines certain. These have been an earnest of the Emperor's desire to please and conciliate the Americans upon both the political and personal sides.

High politics has, however, been only one of the influences which have led to this decision. The principal idea, never out of mind, has been that of broadening the demand for German wares, the result that there is general concurrence in the opinion as to the necessity and the helpfulness which come from the most perfect and varied displays at all the great exhibitions, that at Paris in 1900 was striking, following though it did the failure to exhibit there at all in 1889. The great Krupp works which has so distinctly been built up to its present proportions by the policy inaugurated at the Great Exhibition of 1851, and since maintained without interruption, really been the one potent example.

The latest returns show in a very striking way the growth of trade relations between the United States and Germany. In the Chicago Exhibition of 1893. In that year the exports of the United States to Germany amounted to 92,357,163 dols. There had increased in 1901 to 191,780,427 dols. Last year there was a reduction of about 18,000,000 dols, due wholly to the change in the maize crop. In the year following the Chicago Exhibition the imports of German merchandise into the United States were 69,387,995 dols. In 1902 these had become 99,995 dols. Both in imports and exports Germany, in relation to the United States, has passed France, and is second in importance, although still far behind the United Kingdom, the predominance of which in both respects still remains unchallenged.

At the Chicago Exhibition of 1893 Germany expended about 800,000 dols. (160,000 £) upon its buildings, its official display, and as an aid to the manufacturing and commercial centres. No country in the world has been quicker to see the importance of the phenomenal growth of population and wealth which has been going on in the Mississippi Valley during the last twenty years—an expansion in purchasing power which has not escaped the knowledge and attention of the Emperor. This far no announcement has been made of the sum likely to be set aside for use at St. Louis; but from assurances given by the Emperor, that for the purpose of illustrating every phase of artistic, manufacturing, agricultural and industrial development Germany would make at St. Louis the finest exhibit ever shown from that country, the conclusion has been reached

that at least 4,000,000 marks (200,000 £) will be set aside for this purpose. The Commissioner, whose appointment has just been formally announced, sailed at once in order to investigate upon the spot the progress made in the preparation for this exhibition, and to choose the site for the building to be erected by his Government.

### THE ASSOUAN DAM.

ON Saturday evening Sir John Aird explained his operations in Egypt in connection with the Assouan Dam. Two of his partners, he said, were present and he thought he might say for all of them that they had had the opportunity afforded them of carrying out works which were not only of national but also of world-wide interest. Those works they had carried out, he might say, quite successfully. The secret of the success of the great work in which he had been engaged was that they had the advantage of several things; and first he must express the gratitude which had always been in his breast to the kind Providence which gave them two low Niles during the construction of the works, an event which had not occurred for forty years and did not exist now. He also desired to express his thanks for the kind and cordial assistance of the Government in enabling them to put their shoulders to the wheel and to make their backs firm so as to carry out the work they had undertaken, which they had accomplished at an earlier date than they had at first anticipated. He did not desire to take all the credit for the work. Mr. Fitzmaurice, now engineer to the County Council, who was the chief engineer at Assouan when they had commenced these works, and who, he was glad to see, was present that evening, had helped them materially to do what they had been able to accomplish and they were very grateful to him for his work on their behalf. He must also express his thanks to the fellahs who had worked so well, for, as in other cases, so in Egypt, it was not because of the work of one individual, but because they were able to get the valuable assistance of others that they found that they were able to do what they had done in that great and wonderful country. They had the help, too, of the Egyptian Government by their officers working with them in the matter, and so it was that by means of all these aids he had been placed in the position of one of whom it had been said that he had "dammed the Nile." They had probably read the telegram which came from Lord Kitchener last week. He was very

proud to receive it, and it would be put in a frame, placed in his office, and treasured by the firm. Lord Kitchener had done them the greatest possible honour, and him the greatest pleasure one man could give to another, by expressing, as he had done, his kind appreciation of the work they had carried out for the benefit of Egypt, and he hoped also for that of this nation.

### RIGHT TO LIGHT.

JUDGMENT has been given by Mr. Justice Buckley in the case *Boyce v. Paddington Borough Council*, which related to the rights of adjoining owners to claim access of light from over disused burial-grounds. His lordship said:—

When stripped of all technicality the question to be determined in this action is whether the owners of lands circumjacent to and abutting upon other land which has become an open space within the Metropolitan Open Spaces Acts, 1877, 1881 and 1887, and the Disused Burial Grounds Act, 1884, become at once, by virtue of those Acts, or must be allowed to become, after the period of the Prescription Act, by virtue of an enjoyment which cannot be excluded by the erection of a hoarding, entitled as of right to the access of light to the windows of any buildings which they may erect contiguous to the open space. The open space in question is the disused burial-ground of St. Mary's, Paddington. The plaintiff is a person who has recently erected a large block of flats immediately abutting upon that open space, with numerous windows overlooking it. The defendants contend that they are entitled to erect a hoarding in front of those windows so as to preclude the plaintiff from prescribing for rights of light. The plaintiff says they are not so entitled, and asserts his case upon two grounds. He says, first, that he, as a member of the public, is entitled to insist that the space shall be an open space, from which it results that there will be free access of light to his windows; and, secondly, that, whether this is so or not, the defendants cannot erect a hoarding so as to prevent his becoming entitled by prescription, because they are by the relevant Acts of Parliament forbidden to erect any building, temporary or movable, except for the purpose of enlarging the church. A hoarding erected for the purpose of preventing the acquisition of a prescriptive right to light is, he says, a building. The defendants have raised the contention that the plaintiff cannot maintain the action without the concurrence of the Attorney-General. This contention, to my mind, cannot succeed. The

plaintiff is suing either in respect of an alleged right to the free access of light to his windows over the open space, or in respect of a public right to have the space maintained as open space without the erection of a hoarding, which he calls a building. In the former case he is suing upon an alleged private right; there is no public right of access of light to private property. In the latter he is suing in respect of an interference with a public right from which he personally sustains special damage. In either case he can sue without joining the Attorney-General. The public are not the owners of lights overlooking the space, and there is no public right to access of light to any windows. The public right is to have the open space so kept as to allow the enjoyment by the public of the space in an open condition, free from buildings. That right the plaintiff is entitled to as a member of the public, but any right to access of light to the windows of his property is not a public right. It is not a right which any member of the public enjoys in common with himself. If, therefore, he claims upon the footing that he has a right to the access of light to his windows, he is suing in respect of a private, and not a public right, and the Attorney-General is not a necessary party. Further, if he is suing in respect of a right as a member of the public to say no building shall be put on the land, and this hoarding is a building, there he would be suing in respect of a public right and the Attorney-General would be a necessary party, but for this fact—that the plaintiff personally upon this hypothesis suffers special damage from the breach of a public right, and if he do so suffer then he can sue without joining the Attorney-General. A plaintiff can, as it seems to me, sue without joining the Attorney-General in two cases; first, where the interference with the public right is such as that some private right of his is at the same time interfered with—as e.g. where an obstruction is so placed in a highway that the owner of premises abutting upon the highway is specially affected by reason that the obstruction interferes with his private right to access from and to his premises to and from the highway; and secondly, where no private right is interfered with, but the plaintiff, in respect of his public right, suffers special damage peculiar to himself from the interference with the public right. The former proposition, I think, is to be deduced from *Lyon v. Fishmongers' Company* and *Fritz v. Hobson*, and was one which I had to consider in *Chaplin v. Mayor of Westminster*; while the latter is to be found in *Iveson v. Moore*, *Hart v. Bassett*, *Benjamin v. Storr*, and *Winterbottom v. Lord Derby*. I think, therefore, that the

is well constituted, and I pass on to consider whether the plaintiff has the right which he claims. At the outset it would seem to be an extraordinary proposition that, because an open space is devoted to the public for amusement in an open condition, free from buildings, for exercise and recreation (see Metropolitan Open Spaces Act, section 1, Act of 1881, section 5), the result should be achieved immediately, or by the unavoidable operation of the Prescription Act to the circumjacent owners, as matter of right, easement of light which theretofore they had not enjoyed. I point to one case in which such a construction certainly is admissible. A disused burial-ground which is so dealt with as to become an open space under these Acts may nevertheless be used for the purpose of enlarging a church, chapel, meeting-house, or other place of worship (see the Act of 1884, section 3). If the plaintiff's proposition were true, the owner of adjoining land would after the Prescription Act had run, be (without any power on the part of the owners of the open space to prevent his becoming) entitled to rights of light in the open space which might prevent the subsequent erection of such an enlargement as that Act allows. The proposition for which the plaintiff contends is evolved from the premises that because the space is to be an open space, there must be free passage of light over it to the windows of houses built on the adjacent land. This begs the question and assumes that a hoarding cannot be erected. The Acts do not contemplate the statutory creation of any such consequential rights in the neighbouring owners. The space is to be given for the public purposes for which it is to be enjoyed—namely, for exercise and recreation. It is not to be open so as to create rights in favour of adjoining landowners. The Act is not dealing with the creation of easements or the creation of any right other than a right in the public to enjoy the space as an open space for the purposes indicated in the Acts. As an adventitious advantage the owner of the adjoining land would, no doubt, in most cases in fact obtain the benefit of light. But he is not, I think, entitled to it as a matter of right. The rights created are public rights. There is no public right to have free access of light to windows on land surrounding the open space, or any part of it. The plaintiff's contention really is that he has that right which would be a private right because there is another and a better public right. But then the plaintiff says, "Assume by virtue of the statute I do not immediately acquire an easement, as a member of the public I have a right to insist that no

building shall be put upon the open space, and if no building" (which he says includes a hoarding for the purpose of preventing a prescriptive right) "is put up I shall under the Prescription Act get a right in time, and the effect of the Acts is that matters must be so left as that I shall acquire that right." This argument is rested upon a contention that a hoarding put up for the purpose of preventing the plaintiff prescribing under the Prescription Act is a building. Several cases have been referred to as to whether a hoarding is a building. In *Pocock v. Gilham and Wood v. Cooper* it was held that a hoarding or a screen was, and in *Slaughter v. Mayor of Sunderland*, *Wilson v. Queen's Club* and *Foster v. Frazer* that it was not, a building. From these cases I can derive no principle other than this—that a hoarding may or may not, according to the context, be a building. If the building spoken of be one which it is contemplated shall have a stuccoed front and a slate roof (*Foster v. Frazer*) or a building to be erected under a building lease (*Wilson v. Queen's Club*) a hoarding will not be a building. If the question arises under a lessee's covenant not to put up a building, and he does put up a hoarding which affects the adjoining occupier (*Pocock v. Gilham and Wood v. Cooper*) it may be a building. What I have to consider is whether such a hoarding as the defendants would put up to prevent the plaintiff from acquiring prescriptive rights would be a building within the Acts with which I have to deal. In my opinion it would not. It would be an erection, not put up for any purpose of building, but as a necessary act to prevent the acquisition of a prescriptive right. The word in section 5 of the Act of 1881 occurs in the connection that the land is to be enjoyed "in an open condition free from buildings." I think this means such buildings as would preclude or diminish its enjoyment in an open condition for exercise and recreation (Act of 1877, section 1). In section 3 of the Act of 1884 the erection of any buildings upon a disused burial-ground is forbidden except for the purpose of enlarging a church. I think the word "buildings" there means erections which would cover some part of the ground, as the enlargement of a church would do. It does not refer to something in the nature of a fence or barrier to prevent the acquisition of prescriptive rights to light. Upon these grounds I come to the conclusion that the plaintiff has not by virtue of the Acts acquired such an easement as he seeks to enjoy, and that the defendants are not by the Acts precluded from erecting such a hoarding as is necessary to prevent him from obtaining the benefit of the Prescription Act. I think, therefore, that the action fails, and I dismiss it with costs.

**CROSS TRAFFIC IN LONDON THOROUGHFARES.**

THE highways committee of the London County Council have reported upon the question referred to them at the beginning of the year, of dealing with cross traffic in main thoroughfares by means of bridges or subways. The chief engineer of the Council, in dealing with the suggestion for the construction of a subway to meet the cross traffic at the junction of the Strand with Wellington Street, and of Holborn with Southampton Row, has pointed out that the scheme already sanctioned by Parliament for the construction of a shallow, underground tramway from Theobald's Road along the new street to the Strand would make the construction of a subway for ordinary vehicular traffic impracticable, and that it would also be impracticable to find space for the approaches to a bridge over Holborn in consequence of the tramway subway, when it will come to the surface in Southampton Row. If a bridge with inclined approaches were constructed from Wellington Street to Waterloo Bridge it would be necessary to remove the western steps of Waterloo Bridge and to carry the approach to the first abutment of the bridge, with the result that even then the gradient would be as steep as 1 in 20. This could be improved to 1 in 30 if the inclined road were extended to a considerable distance on to Waterloo Bridge, involving a widening of the northernmost span of the bridge. This widening could not be carried out by merely widening the arch, but would necessitate a girder span over the Victoria Embankment, unless the bridge were widened for its entire length across the river. It would be necessary to widen Wellington Street and to place the inclined approach in the middle of the widened thoroughfare, because if the inclined approach were placed on one side of the street one line of the traffic using the approach would, upon reaching Waterloo Bridge, have to cross one line of the traffic passing on a level to the Strand, with the result that the construction of the bridge would do little more than tend to remove from the Strand the congestion caused by cross traffic to the point where the inclined approach delivered on to Waterloo Bridge. To construct a subway for general traffic from Southampton Row under Holborn would not only involve considerable interference with the projected tramway-subway scheme, but would also make it necessary either to syphon the Fleet sewer in Holborn or to divert the sewer at considerable expense. The highways committee feel that they have no alternative at the present moment but to advise that the question of the con-

struction of a subway or bridge at the junction of the Strand with Wellington Street, and at the junction of Holborn with Southampton Row should be postponed until after the formation of the new street from Holborn to the Strand.

**REGISTRATION OF PLUMBERS.**

MR. WALTER LONG received at the Local Government on the 6th inst. a large deputation representative of all every part of the country, and of all shades of politics in regard to the Plumbers' Registration Bill. A number of medical other bodies were also represented.

Sir L. M. M'Ever, M.P., introduced the deputation, which included Sir S. Crossley, Bart., M.P., and many others.

It was stated that more than half the members of the House had expressed approval of the Bill, which had passed the House of Lords and was now before the Lower Chamber. Among the speakers were Alderman Sir John Knill, master of the City of London, and Mr. Coles, clerk of the Plumbers' Society, and others.

Mr. Walter Long, in reply, said he entirely recognised the influential character of the deputation, the whole country being represented in some form or another. He had no hesitation in saying that the Government regarded the measure with hearty approval and with goodwill, for there was great room for improvement in plumbing work.

However great the discoveries of science, and how anxious the householder might be to have the best system of drainage in his house, his efforts were likely to be defeated if work so carelessly done that all appliances were rendered useless, with a consequent spread of disease. So far as the prospect of the Bill was concerned, they were almost in sight of Paradise, and they only wanted to get those gates open.

Personally, he regarded the present position of non-controversial legislation in the House of Commons as most unfortunate and most serious for the country at large. There was no department where there was greater need of departmental legislation than his own, and yet it was a practical impossibility for him to carry less contentious measures of his own.

It would not be honest of him to say that he could advise the Government to take up the Bill in the present state of public business, but he suggested that Members of Parliament interested in its provisions should endeavour to render it uncontroversial, in which case he would support it in Parliament.

# The Architect.

## THE WEEK.

ON May 10 WILLIAM HENRY BARLOW was presented with a testimonial and address from the members of the Institution of Civil Engineers, congratulating him on attaining his ninetieth year. He passed from this life on the 12th inst. His name has been long associated with construction. He and his brother were sons of PETER BARLOW, who was professor at Woolwich, and whose "Treatise on the Strength of Materials" is still recognised as a standard work of reference. The sons were also authorities on materials. WILLIAM BARLOW gave much attention to strains in beams and the determination of the neutral axis. He demonstrated that there was an element of strength in beams subjected to transverse strain arising from the lateral action of the fibres or particles on each other, which tended to modify the effect of the unequal strains and opposite forces, and thus diminished the amount of extension and compression which would otherwise arise, constituting in effect a resistance to flexure. In the early days of railway construction WILLIAM BARLOW was engaged on the Manchester and Birmingham line. At a subsequent time he became engineer of the Midland system. Acting on a suggestion of some Burton brewers who wished to have cellar space unimpeded by columns, he designed the roof of the St. Pancras terminus as a single span, a feat which at the time was without precedent. As a consulting engineer his advice was widely sought.

WHEN the extent of the limestone formation in these countries is considered, it indicates a defect in our commercial system that it is necessary to go to Belgium and elsewhere abroad for lime. At the meeting of the London County Council on Tuesday it was decided to order 14,800 tons required at the Barking outfall from a Belgian firm. During five years Belgian lime has been utilised in the works of the Council, and, according to one of the members, it answers better than English lime. When so much money is expended on Belgian iron and steel every year there seems to be little use in condemning the importation of lime. But every case of the kind makes it more evident that the field for British productions is every year becoming more narrow in Great Britain. There is no doubt that one cause is the difference between the facilities offered for the carriage of goods and materials in this country and abroad. In all parts of England complaints are heard about the obstacles which exist to the conveyance of goods, as if railways were intended for passenger traffic alone. The shipping companies are also apparently indifferent to trade. There are no doubt other causes at work, and the evil which arises in connection with the building trades especially is not to be remedied by optimistic theories about the advantages of Free Trade as a whole.

THE decision which was given on Tuesday by Mr. Justice FARWELL in WEBSTER v. BREWES should make the necessity more apparent than heretofore of having a general plan indicating the class of buildings to be erected whenever an estate is sold in plots or let on leases. It is not pleasant, for instance, when a man will convert part of a garden into a site for a stable regardless of the inconvenience which will arise to his neighbours. Some will say the local authority need not pass the plans for the stable, but that is one of those theoretical conclusions which do not always apply to actualities. In the case mentioned above, which related to an estate at Enfield, it was covenanted that the purchaser, his heirs and assigns, would not erect on the land any buildings other than one or two detached villa residences "with the appurtenances thereto," of a certain value. The defendant was not satisfied with having stables and coachhouse as well as a dwelling-house on his plot, but erected a building 30 feet long and 20 feet high for the storage of bicycles, firewood, sundry utensils, &c. The plaintiff demurred to the new erection on the ground of obstruction of light and air and interference with the view from the windows. His lordship considered that the purposes for which the building was

erected were reasonable, and that the defendant was entitled to erect such a building without regard to the convenience of his neighbour, who could not dictate to him the height to which or the position in which it ought to be built. The case was therefore dismissed with costs. To a lawyer, that was the only proper ending. An architect must, however, believe that the outbuilding diminished the amenity of any adjoining properties, and might have an injurious effect on their value. It is not to be denied that new requirements have occasionally to be met. Many a prim suburban garden has been spoiled by improvised sheds for bicycles, and those structures become eyesores to those who do not employ similar machines; but who is to make a sacrifice in such cases?

THE Château d'Eu, of which about two-thirds were destroyed by the conflagration of last week, if considered as a work of architecture was not one of the remarkable buildings of Normandy. It was erected by the Duc de GUISE in 1578 on a site where a castle stood that belonged to several ancient families in succession, and which was consumed by order of LOUIS XI. The building was an example of construction in red brick, and was erected under the direction of CLAUDE LEROI. The roofs were of slate and of excessive height. In modern times its uses were varied. During the first revolutionary period it was used for a hospital. NAPOLEON wished to make of it a country house. When it came into the possession of the Duc d'ORLEANS, afterwards LOUIS PHILIPPE, it was enlarged and adorned. On the walls over a thousand portraits were hung. In it was placed the statue of *Joan of Arc*, by the Princess MARIE OF ORLEANS, which was popularised by plaster statuettes. After the flight of the king the portraits were removed. The chapel contained windows of painted glass, which were among the products of the Sèvres factory. It is remarkable that all of them escaped unbroken during the fire. It is supposed that the danger arose out of carelessness by the servants, and when the flames burst out there was not sufficient water to overcome them. It is believed that the losses will be met by insurances, but no money can restore the historic associations connected with the parts which have vanished.

AN endeavour has been made by one of the Bohemian learned societies to demonstrate that it is not necessary to have a numerous and costly expedition in order to obtain information about districts which have at one time attained some celebrity. A couple of professors, a government official and an architect have had the courage to visit together the land of the Isaurians in Asia Minor. The goal of their journey was Konieh, formerly known as Iconium. The explorers have been rewarded by over three hundred inscriptions, the greater part being unknown to scholars. There was no money to expend on displaying the remains of ancient buildings, but about four hundred photographs were taken, many of which will provoke inquiry and, it may be, will lead to further research. One interesting Hittite monument was seen in Fassiler. A statuette was evidence of the presence of a Greek artist or a worship derived from Greece. The little expedition was also able to obtain geographical information, by which maps of Asia Minor can be corrected.

ALTHOUGH Great Britain exercises political and financial power in Egypt, yet in all things relating to the arts France somehow retains supremacy. The new museum of antiquities in Cairo, which was opened on Saturday, has been designed by a Frenchman, M. MARCEL DOURGNON. He was also the architect of the Egyptian Palace which formed part of the International Exhibition of 1900. M. DOURGNON was a pupil of M. PASCAL. He had charge of the construction of the Bourse at Valparaiso, and also assisted at the works of the Institute of Oriental Archaeology and of the Hôtel de Ville, Paris. With M. DENYS PUECH, the sculptor, he designed the monument of Mdlle. HENRIOT, the young actress who lost her life in the fire at the Théâtre Français. M. DOURGNON in his design has preferred the Classic to the Egyptian or the Arabian style. The building is arranged in such a way as to have the heaviest remains on the ground floor, and on the first floor are objects in glazed cases, with special rooms for jewellery, &c. The new museum is a substitute for the Boulak Museum.

PAINTERS' ARCHITECTURE: SALVATOR ROSA.

### THE FRENCH ACADEMY OF FINE ARTS.

IT is remarkable that among all the academies of art in Europe the Académie des Beaux-Arts alone can claim to exercise influence which is not local. Whether it is the oldest, and on that account has a right to receive attention, may be disputed. There are academies in Italy which are said to have been constituted at an earlier period, but as the line of continuity was occasionally broken, doubts have arisen about the true age of those institutions. The Académie des Beaux-Arts, if not identical with the academy which LOUIS XIV. founded in 1648 at the suggestion of COLBERT, and on the lines laid down by LE BRUN, is at least its legitimate successor. There were originally three academies of art, viz. painting, sculpture and architecture; but in Rome, at least, it was recognised that the united students formed one body.

The Académie Française, which was to be the guardian of the French language, was erected some years earlier, mainly by the efforts of Cardinal RICHELIEU. There was consequently some friction about the relative positions of the literary scholars and the artists. In France there is a love of system which in government leads to centralisation. One of the early Acts of the National Convention was to fix academies on a new base. The world of knowledge was divided into three great classes, viz. (1) physical and mathematical sciences, (2) moral and political sciences, and (3) literature and fine arts. That signified the downfall of several bodies in France which were known as academies. But the arrangement was not permanent. By 1803 it became doubtful whether ethics and politics could be regarded as sciences, and consequently they were suppressed in an official sense. It was also concluded that literature and art were not sufficiently allied in their methods to be united. It was therefore decided to separate the language and literature of France from those of ancient times. The fine arts were to be classed apart. Another change was made at the Restoration, and the relative position of the academies was determined by the dates of their foundation. When LOUIS PHILIPPE's turn arrived for ruling he also tried his power on the academies. He determined to have five, viz. the Académie Française, an Academy of Inscriptions and Literature, an Academy of Sciences, an Academy of Fine Arts, and an Academy of Moral and Political Sciences. While each had its own rules, they were all to form part of a body to be known as the Institut.

The Academy of Fine Arts, as the representative of the academies of painting and sculpture, music and architecture, was to contain followers of those arts. Engraving, including medals and gems, was also included. As in the case of other academies, the preparation of a dictionary of the terms used in the fine arts was to be one of the duties of the members. As yet, however, no complete dictionary has been published by any section of the Institut.

If the interest of foreigners could be taken as a test,

the Académie des Beaux-Arts is the most successful of all. The purity of the French language has more attractions for natives than strangers; science, archæology and ethics can be studied with at least as much advantage in other cities as in Paris. But as yet Paris is universally recognised as the capital of modern art, and, directly or indirectly, the Académie des Beaux-Arts is its omnipotent power. The jurisdiction is often disputed, and some will not accept the edicts of the law-givers. Still, it must be owned that no fallible potentates are to be found who are more disposed to do right by securing the triumph of art than the Academicians. Their position is considered as a solemn trust, and although prizes and appointments are necessarily confined to Frenchmen, yet foreigners from all lands can take advantage of the means at the disposal of the Academy for instruction in art.

The annual assembly for the distribution of prizes which was lately held was enough to show that the academical authority has not overcome the spirits of the young artists. They were as unsubdued as ever. The president for the occasion was M. JEAN PAUL LAURENS, who, although he never disposes himself to win the favour of students or men in authority, is sincerely respected for his honesty and self-sacrifice. If his tendency as a painter is towards the sombre and the tragic, it is owing to his natural disposition and the lessons he derived from his own struggles. He was never fortunate in winning the Prix de Rome or any of the great prizes of the Académie; indeed, we believe his circumstances never allowed him an opportunity to compete for them. But in addressing the students who were about to depart for the Villa Médicis, he did not, like some of his contemporaries, refer to his own success as evidence that a sojourn in Rome was not needed for the perfecting of an artist. He anticipated that like students during the last three or four centuries, the latest representatives from France could not escape becoming enthusiastic to an extent that was oppressive, and he told them to avoid resisting the power of the place, although they become sufficiently intoxicated as to imagine that masterpieces were to be seen everywhere. Time would bring a corrective, especially when they sought nature as a guide. M. JEAN PAUL LAURENS had to refer to some of the losses of the year. One was the architect GEORGES COQUART, who had won the Prix de Rome, another the painter BENJAMIN CONSTANT.

After the distribution of prizes it is customary to read a paper on some French artist who has lately passed away. This year the subject was JEAN ALEXANDRE FALGUIÈRE, the sculptor, who had attained all the honours open to French artists, Prix de Rome, medals of all degrees, high rank in the Legion of Honour and membership of the Académie des Beaux-Arts. He was the son of a mason and was born in Toulouse, a city which has produced many artists. He gave signs of promise and the municipality sent him to Paris. At first he was not disposed to scorn delights and live laborious days. But all his

associates recognised his power, however latent it was to himself and the masters. At length he exerted himself and carried off the Prix de Rome. He was able to combine toil and pleasure in Rome. With his southern temperament and susceptibility to pleasure it was not to be expected that he should devote himself to melancholy subjects. In 1864 he startled the Salon by the animation of his *Cock-fighter*, a young fellow in a state of excitement bearing his feathered victor on one of his arms. It won a médaille for FALGUIÈRE. His *Tarissus*, a young martyr, was in a different style, and was also awarded a medal in 1867. Then was displayed his capability to treat any sort of commission. He produced busts of many modern celebrities, old and young. *Eve*, *Diana*, *St. Vincent de Paul* were each successful expressions of an idea. The allegoric was also attempted in his *Progress overcoming Error*.

The Académie des Beaux-Arts may well rejoice in the success of FALGUIÈRE. He was a representative of the system. Having won his way through French schools, he was able to turn his knowledge to account in the production of works which are not likely to be soon forgotten. There was no sign of any decay of ability, and the country was justified in assuming there would be many more fine works from his hand. One at least was indicated, a quadriga to represent the glories of the Republic, and which should surmount the Arc de l'Etoile. FALGUIÈRE has had successors, and while such artists are forthcoming the Académie des Beaux-Arts will continue to be a luminary towards which the eyes of artists will be directed from all parts of the world.

### FORMAL GARDENS.\*

THE conduct of life was aptly compared to gardening by IAGO in one of the few moments when he was inspired by honesty. According to him, "Our bodies are gardens, to the which our wills are gardeners; so that if we will plant nettles or sow lettuce, set hyssop and weed up thyme, supply it with one gender of herbs or distract it with many, either to have it sterile with idleness or manured with industry, why, the power and corrigible authority of this lies in our wills." The obverse of his proposition is no less true, for we can consider gardening as the education of the ground, some would say the dandying of it. Left to itself the earth is likely to produce nothing but "hateful docks, rough thistles, kecksies, burs, losing both beauty and utility." But when properly controlled the rankest land can become an Eden. It needs, however, toil that never ends. Just as MICHEL ANGELO was always studying or trying to improve himself, the garden must be subjected to continual and systematic efforts, or all the labour expended on it will become useless.

Every garden which is worthy of the name has, therefore, a historical or biographical interest. The condition of the garden represents not only the lapse of time but continuous attention on the part of its owners. It is not sufficient to create a garden, as is done with pictures and statues; the appearance must be conserved with a watchfulness which surpasses that required even in buildings. A garden thus becomes a memorial of constant efforts to uphold order and beauty by endeavouring to turn nature against itself. We suppose it was on that account so many warriors, leaders and statesmen have found delight in the operations. Enough opposition was offered to excite what was left of their combativeness, and the necessity of law and government was exemplified daily. The description of the old AERTES, who once conquered Nericus, as given in the *Odyssey*, is applicable to many an English warrior in our time. As his son ULYSSES said to him—

Thy garden thrives; I mark  
In all thy ground no plant; fig, olive, vine,  
Pear-tree or flower-bed suffering through neglect,

in other words, every part was marked by the effects of discipline. The "ruddy nymph of gardens" has enticed great men in all ages to her pleasant service.

One of the causes of the delight which is found in turning over the pages of Mr. INIGO TRIGGS'S "Formal Gardens" arises from the majority of them exemplifying the influence of time, an agent which is indispensable for the production of a perfect garden. Montacute dates from the end of the sixteenth century. The garden of Canons Ashby, "originally made in 1550, was altered about the year 1708, but has since defied the changes of fashion, remaining practically the same for nearly 200 years." One at Longford Castle dates from the end of the seventeenth century, although some transformations have been accomplished. One of the gardens of Wilton House was laid out by ISAAC DE CAUX about the middle of the seventeenth century. The Dutch Garden at Levens Hall is described as "probably the most perfect example remaining in England of a garden designed under the Dutch influence prevalent soon after the accession of WILLIAM and MARY." At Brickwell, Sussex, "the gardens present the same appearance as they have done during the last two centuries." There are many other gardens introduced in the work which have antique repose, and the contemplation of the views in consequence becomes almost a sedative for those who have to toil far from such scenes.

In the last and final part of the work there is no deviation in the attractiveness of the plates from those which have been published. The Terrace Lower Garden, Montacute, becomes an admirable foreground for the mansion. The balustrading is of similar form to what is seen around the roof, and by its lightness suggests its ornamental character. The leaden images of amorini from Wilton House are admirably modelled. The Privy Garden, like much else connected with Hatfield House, appears to be unchanged by centuries. A general view is obtained of the Italian garden at Bowood, in which architectural lines are dominant. Examples of rose gardens are given from Rockingham and Boughton. In Bridge End Gardens at Saffron Walden massive borders and egg-shaped trees are seen. An alcove walk and yew garden from Orley Hall reveal other varieties of formality. The Long Walk at Belton House, Grantham, is partly a restoration, but the treatment is refined, especially in the contrast between straight and curved lines, with a fine wood outside the garden. The rosery is in front of a conservatory, and has a central pond with a rose walk around. The view of the topiary work at Levens Hall was taken in winter, when the quaintness of the subjugated trees becomes more marked. The garden at Brickwell is not attached to any great mansion, but those who laid it out made a model of it. On one side of the flower garden is a fishpond with grassy sloping sides. The yews are cut as cones and there are thick hedges of yew. Westbury Court has a garden so truly Dutch that canals or water pieces have been excavated, "one in the form of the letter T; the other a straight piece 450 feet long by about 22 feet broad, at the end of which is the quaint two-storey garden-house supported on columns, now incorporated in the new building." Holland House still retains its Dutch garden, which was, however, formerly of less area. One of the plates shows the gateway in the fore-court. This is an interesting composition. According to HORACE WALPOLE, "STONE in 1629 undertook to build for the Earl of HOLLAND at Kensington two piers of good Portland stone to hang a pair of great wooden gates; the estimate of the piers (which were designed by INIGO JONES and are still standing at Holland House, though removed to a greater distance from each other) was 100*l*." The present iron gateway is rather small, and the piers seem excessive, but they are of fine form, Tuscan in style, and on one side are approached by steps, carried by an arch over the water of a fountain.

In addition to Mr. LATHAM'S fine photographs there are a great many careful plans by Mr. INIGO TRIGGS. As a supplement to the descriptions we have chapters on garden-houses, dovecotes and pigeon-houses, gate piers, terraces, knots and parterres, topiary work, garden lead-work, stone vases, sundials, fountains, stone balustrades, wall gateways and mazes. All are amply illustrated. It will be evident that Mr. INIGO TRIGGS has prepared a work which for the architect can be considered as an encyclopædia, for it contains sufficient information to enable gardens to be laid out and adorned in the styles which have been most popular in Great Britain. To some

\* *Formal Gardens in England and Scotland: Their Planning and Arrangement, Architectural and Ornamental Features.* By Inigo Triggs. Illustrated by 72 Plates from Drawings by the author, and 53 reproduced from Photographs by Charles Latham. London: B. T. Batsford.)

extent there has been a prejudice against formal gardens, for it was supposed they were opposed by their nature to the features of landscapes which are credited as arrangements of nature. Uniformity and regular divisions came to be considered as indispensable. A glance at the plates will convince the most sceptical that every fine type of formal garden can gain by having nature in an uncontrolled state for a contrast. One supplements the other. In the formal garden we see the variety, unity, regularity, order and proportion which some philosophic writers have held to be essential to beauty. There are gardens without all those qualities which are gratifying to the eye. Which is preferable for adoption we are not called upon to decide. It is sufficient to say that in the scenes placed before us in "Formal Gardens" we have materials for giving delight to the eyes as well as for raising associations of an enjoyable kind. The work is a worthy addition to the noble series devoted to English work which Mr. BATSFORD has initiated and continued in the manner of an enthusiast rather than of a publisher. The volume is dedicated by special permission to the QUEEN.

#### MOTTOES ON BUILDINGS.\*

IT is impossible to say when the art of writing was first practised, but it may be assumed that from an early date men were not satisfied with the use of materials for their lettering which quickly decayed. Recent discoveries have revealed that slabs of clay were used in Assyria as records for simple transactions in buying and selling, and permanence was consequently given to "small-beer chronicles." It must have seemed so remarkable that thoughts could be expressed by means of written characters, we need not be surprised at men endeavouring to force some knowledge of themselves on posterity. The foolish people who still degrade walls and seats by cutting names and dates on them are only following precedents which are as old as civilisation.

The Egyptians were evidently systematic in their use of inscriptions. It is not to be supposed that more than a fraction have survived the vicissitudes of centuries. But those remaining have helped to fill in with detail the outline found in the fragments of MANETHO. MARIETTE and LEPSIUS have restored dynasties. BIRCH was able to produce a record of the splendour of the monarchy at the beginning of the eighteenth dynasty by means of the lettering on the walls of Karnak. Apart from the annals in stone are others which, as indicating modes of thought, are probably of higher value. The mystery of time was subtly suggested by the inscription on the Temple, or it may be the statue of Isis:—*I am all that is, or has been, or shall be, and the veil which is over my face no mortal hand has removed.* The Egyptian language was well adapted for expressions of that kind. It was different with the Romans, for their temple inscriptions especially are of the simplest, and at the most laudatory of some emperor. The same succinct manner is seen in the inscriptions on tombs which are found not only in the catacombs of Rome, but in other parts of the Empire. Examples are to be seen in some of the French provincial museums. Not only Roman lettering, but a Roman style was employed up to the twelfth century.

There are so few examples existing of the great buildings and houses of the pre-Gothic period in Europe, we cannot be sure of the extent to which inscriptions were employed in them. When we find DANTE giving one which in his vision he saw on the entrance to hell, it is evident he was only introducing a feature which was familiar to the Italians of the fourteenth century on entering one of their cities. Indeed, it is maintained that Italian is as well adapted for lapidary compositions as the more ancient Latin. In DANTE's time inscriptions were a necessity. CIMABUE and other artists considered it becoming as well as useful to introduce a text relating to a saint or historical figure on a scroll or ribbon, which appeared to proceed from the mouth of the individual represented. Under varying conditions the practice continued for a long time. One of the latest examples is

found in the painting of *Magdalen at the Feet of the Saviour* by PAUL VERONESE. Two angels bear a scroll on which the words appear *Gaudium in celo super uno peccatore poenitentiam agente*. NICOLAS POUSSIN, who was a learned painter, was in favour of inscriptions on pictures. It was no doubt with his approval that the engraving of his *Testament of Eudamidas* supplied a copy of the will, as it is found in PLUTARCH. In his *Arcadian Shepherds* he introduced an altar, on the face of which was engraved *Et in Arcadia ego*, words which have become proverbial among artists and poets. Ever since attention has been given in France to the use of inscriptions, especially with sculptors and architects. FALCONET was supposed to have attained classic simplicity when he employed no more than the two names, *Petro I., Catharina II.*, on the rock which serves as a base for the equestrian statue of PETER THE GREAT in St. Petersburg.

English gentlemen who had made the grand tour could hardly fail to believe there was appropriateness in having their family motto or some pithy or suggestive saying inscribed on their mansions. Sometimes they were so enamoured of wisdom, they were introduced in several parts of the building. The Gallery of Gorhambury, erected by Lord Keeper BACON, abounded in Latin inscriptions. Loseley, near Guildford, which was visited by Queen ELIZABETH, and belonged to the MORE family, contained several, including some which were of the punning variety, as *Morus tardi moriens morum cito moriturum*. In the hall of Farnham Castle is an example of the same kind, *Au Dieu foy, aux amis foyer*. Hospitality as an English virtue was repeatedly suggested by such lines as

*Through this wide opening gate  
None come too early, none return too late,*

or the more familiar *Welcome the coming, speed the parting guest*. But a hint was occasionally given to guests as in the Harleyford inscription, *If thou speakest evil of thy neighbour, come not nigh the door of this house*.

A vast difference is to be observed when Scottish inscriptions are found. They are more stern and ethical, often more cynical. We are not aware of any house which announces that *All things come to the man who can wait*, but the same meaning was conveyed by an inscription which was formerly over the door of a house in the West Bow, Edinburgh:—*He yt tholis overcommis*. Another sententious piece of wisdom was deciphered by ROBERT CHAMBERS in the Cowgate, viz. *Gif ve deid as ve sould, ve nicht haif as v vald*, which means, "If we did as we should, we might have as we would." The words were supposed to be cut about A.D. 1500. Some resolute reformer who declined to follow the beaten track must have inspired the inscription once found on a stone of the wall of Marischal College, Aberdeen, *Thai say: quhat say thai, let them say*. The words found over the gate of Craigievar Castle are known and accepted wherever Britons are found, *Doe not waiken sleipng dogs*, a warning which is still acted on in many an affair. The Irish gentry were not much disposed to have sentences engraved on walls or gateways. Those which are recorded are generally apocryphal.

We are told in the book under consideration that "in the German-speaking countries of Europe we find a richer collection of house mottoes than anywhere else, and decidedly of a higher religious type." The following is an example:—

*Dies schöne Haus ist Sand und Stein;  
Wie werden die im Himmel sein?*

The Italian mottoes are likely to be in many cases derived from older inscriptions. That on ROSSINI's house in Bologna is a paraphrase of two lines of VIRGIL in the sixth book of the *Aeneid*:—

*Necnon Threicius longa cum veste sacerdos  
Obloquitur numeris septem discrimina vovum.*

(Moreover, a Thracian priest with long robe utters in numbers the seven distinctions or notes of the voice.)

Another was taken from CICERO:—

*Non domo dominus sed domino domus.*

It should have been mentioned that the Casa Rossini was built in 1825, during the composer's absence from Bologna. He was much annoyed at the number of Latin

\* *House Mottoes and Inscriptions: Old and New.* By S. F. A. Caulfield. (London: Elliot Stock).

inscriptions which were painted and gilded without his sanction, and he intended to have them all effaced. But his natural love of ease prevented him carrying out his decision. ARIOSTO'S motto on his house in Ferrara is one of the most apt, and suggests that although poor he was not indebted to anyone for the purchase of it:—

*Parva, sed apta mihi, sed nulli obnoxia, sed non  
Sordida, parva meo sed tamen ære domus.*

The existing inscription is only a copy. Above it was a more pompous inscription by the poet's son:—

*Sic domus hæc areosta  
Propitios habeat deos olim ut pindarica*

The suggestion of a resemblance to the house of PINDAR had the effect of preserving ARIOSTO'S, and in that way an inscription was of use. JOHN MILTON, when the attack was to be made on the City in 1642, hoped to have his house secured by means of a sonnet, in which he appealed to the captain or colonel or knight-in-arms:—

*Lift not thy spear against the Muse's bow'r,  
The great Emathian conqueror bid spare  
The house of Pindarus, when temple and tow'r  
Went to the ground: and the repeated air  
Of sad Electra's poet had the pow'r  
To save the Athenian walls from ruin bare.*

But among Italian inscriptions there is not one more suggestive of welcome than that in the grounds of the Villa Borghese at Rome, *Ito quo voles, carpito quæ voles, abito quando voles.*

It would have been an advantage if Parisian mottoes had been included. The writer of the book says:—"I have scarcely any mottoes collected in Paris, and with the omission I may be to blame." Some modern writers have invented and adopted ingenious examples. What can be more amusing than JULES JANIN'S line from BOILEAU on his little chalet,

*Qui ne sait se borner ne sut jamais écrire,*

especially when it is remembered that JANIN was volubility personified? He had three inscriptions on the building. In the same district are other residences which express apt allusions. There is less courage in England, but the examples given in the interesting volume on "House Mottoes" may help to revive a practice which was once familiar in this country.

### SOCIETY OF ARCHITECTS.

THE annual meeting of the Society of Architects was held yesterday evening, when the following address was delivered by the president, Mr. Silvanus Trevel:—

Gentlemen,—Another year has rolled round, and the first duty incumbent upon me is to thank you most sincerely, as well as those who cannot because of distance or otherwise be here to-night, for the kind way in which you have "one and all" unanimously reinstated me in the chair, which under the constitution of our Society I had vacated.

My time, as you know, gentlemen, is very fully occupied, and I have a great distance to come to attend your meetings, but I felt that such a splendid proof of confidence on the part of those who I can see around me to-night, and the many more of our hard-working, busy, professional brethren all over the kingdom, was a vote that had necessarily to be treated with the greatest respect, and that it was again my duty to place such humble services as I may be able to render at the disposal of the Society and its various members for the coming year.

This will be best done by at once recognising the untiring labours of those with whom I have the good fortune to be associated in the Council. There are the vice-presidents, Messrs. Thomas and Pye, indefatigable in their efforts to promote our welfare, and always ready to step into the breach when your President may be absent. Then there is our well-tried honorary secretary, Mr. Ellis Marsland, ever on the alert to serve the interests of the Society or the profession generally, no matter in what form it may present itself—now, registration; next, a difficult question between some member and his client; then the overbearing exaction of some little local building committee who probably have never had an architect's job before, and are not likely to again, and, lastly, how to turn the corner with the very last of the several London authorities that an architect makes the acquaintance of in carrying out the most trivial work. Often I am inclined to exclaim, What should we do without Mr. Marsland? Then comes Mr. Quartermain, whose careful guardianship of the purse has enabled us to put something like 600*l.* to our reserve fund during the past year. Next there are Messrs. Mallett, Cooper, Jennings, Dyson and others of the

Council, ever ready to travel long distances and to give the Society and its members generally the benefit of their advice, based upon long years of matured experience. We have also in our secretary, Mr. McArthur Butler, a gentleman devoted to the interests of the Society, as well as to the welfare of the profession generally. It therefore becomes a very pleasant occupation to carry on the proceedings of the Society, which may in some measure account for the success it is steadily attaining.

I do not propose to detain you so long on this occasion as I did under similar circumstances last year, because on looking through the published copy of that address in the *Magazine* I find that most, if not all, of the points I put forward then stand with even greater force to-day, and should still be objects of our solicitude in our corporate capacity. "Education, qualification and registration" are as much wanted now as then, and upon these, as our watchwords, should our eyes be steadily fixed.

There is the same necessity now as then for this Society to keep a vigilant eye upon the business aspects of the profession, as the many difficult questions referred to the Council by distant members during the past year have shown. Still complaints reach us of wholesale plagiarism, not in the surveyor's departments of our larger municipalities, but in the smaller ones, until serious proposals are made to alter local by laws in such a manner as shall be a protection to the building-owner's architect. There are just the same difficulties experienced now as then in the intricacies of the ancient light and air question, with, if anything, so many more good schemes of development and public and private improvements pigeon-holed, because in the absence of some preliminary appellate court, the attempt to put them into operation might involve ruinous litigation. Dabbling charlatans are just as rampant as ever, and will not be suppressed until a duly recognised legal status is given to our profession. Each American and Continental State in turn adopts registration, and most of our Colonies, but here we are in the unique position of having a section of the profession itself opposing it. Municipal improvements are proceeding in all directions, some wise, some otherwise, especially those connected with the development of electrical energy, which threaten to produce in many of our more crowded cities abominations to architecture second in degree only to the excessive and vulgar advertising inflicted upon us. Owing to our short lease system of tenure for building sites our buildings themselves are not nearly so solidly constructed as in countries where either freehold, or very long leasehold and perpetual feu obtains. These were points referred to by me in detail last year, and I think you will all admit that they are just as pregnant and pressing to-day.

Above all others presses the registration question, particularly to the provincial architect. Wherever one turns, especially in the provinces, this is the first question asked by architects, What is being done in the matter of registration? They are tired of having repeated statements of facts and arguments in its favour, and of what has been done elsewhere. Their minds are thoroughly made up upon the subject. "What we want is the statutory registration of all duly qualified architects, and we look to the men who occupy representative positions in both central and local societies to do their best to procure it for us." This I am hearing wherever I go, and it appears to me to be wasting both time and energy to deliver another address on the subject to convince men already convinced. What is wanted is to be agreed on the details of the proposed measure, and then to actively take the necessary steps for its promotion in Parliament.

It has been said that the promoters of the Bill that has already been before Parliament intended to have constituted themselves the arbiters of who should and who should not be admitted into the profession under the system of registration then advocated. If those making that statement would only take the trouble to study the draft they would find that not only did its promoters not do that, but they provided for the different recognised representative bodies to be adequately represented on the Council, with a preponderating influence to the Royal Institute, who were to have been made the examining body to pass the qualifications of all future admissions under the proposed measure. I mention this as it was not many weeks since a very distinguished architect gave me this as his reason for objecting to the Bill.

This is merely a sample of erroneous impressions that have existed in the minds of some who have been perhaps biased. It would be well therefore if all those architects who have not already seen a copy of the Bill procured one and made themselves fully acquainted with its contents. As it has now been before the country for several years, it is quite possible that some of its details may require modification, but to a dispassionate mind I feel certain it will be regarded as a *bona-fide* attempt to remedy the evils from which the profession and the public now suffer.

It has been remarked that the senior members of the profession have not been particularly enthusiastic on the subject, because they have already all, and perhaps more than registration is likely to give them. That may be so, but is it a good reason for obstructing registration, or denying to the younger men the opportunity of raising the status of their calling? I am not a young man myself, and may not live to get any benefit whatever from registration, but I wish well to the younger men—the rising generation of architects, who will have to carry on the work when we have passed away, and am desirous of assisting in this movement, which will unquestionably tend so greatly to their benefit. I commend it therefore to every architect in the kingdom, be he occupying a representative position or not, to do all he can to support the projected measure. Every one can do his part, and registration in law or medicine, chemistry or dentistry was not carried until many years had been spent in untiring efforts, during which the public at large were convinced that proper qualification and statutory registration were necessary for those professions, and are now participating in the benefits that accrue from what was enacted.

By the kind courtesy of the President of the Institute of Builders I lately attended the annual banquet of that very influential body, and found there was still irritation upon the subject of a standard form of building contract that had formed the subject of discussion between themselves and the Royal Institute of British Architects from 1886 to 1900. It appears that in the latter year a form was agreed upon that was acceptable to both parties. This recognised the right of a contractor to claim under the arbitration clause for any materials used by the architect's instructions of a more costly description than what was specified. This was accepted by the Council of the Royal Institute, but thrown out at a subsequent general meeting of that body, to the great disappointment of the builders. The equity of the builders' proposal seems so apparent that it is much to be regretted that the question cannot be reopened, and the cause for such friction be once and for all removed. I say distinctly that I would never call upon another man to sign what I should refuse to sign myself were our positions reversed, and that either of us should subject ourselves to the absolute dictation of anyone to put what construction he pleased upon the meaning of a specification without reference to arbitration is more than can be expected.

Much I observe has lately been said upon the subject of the education of architects, and in one or two instances only metropolitan and one or two large provincial centres have been mentioned as suitable for that purpose. It must, however, be obvious that all our architects of the future will not be exclusively drawn from these few points, so that it becomes important with the placing of our secondary and higher education on a sounder footing throughout the country, that the claims of our profession should not be overlooked, and that those intending to follow this pursuit should have the opportunity of being grounded in at least all that appertains to the elementary study of the subject in all schools receiving Government aid for technical instruction.

Competitions I notice, too, have come in for a good deal of comment lately. Much has been said about the steps taken to insure, so far as possible, fair conditions and just results where they have been resorted to. Regret has been expressed that there should be occasion to resort to them to such a large extent as now appears to be the case, and often upon the most trivial class of work, where a building committee would be far better served if they put the work in the hands of an architect whom they could trust. But are we not sure that the steps taken to mitigate the evil are sometimes producing it? I observe that a statement was recently made that not only were "conditions of competitions" sent to public bodies who had already decided upon a competition, but also broadcast all over the country to every public body that might sooner or later have architectural work to do. Now, are we quite certain that this is in the best interests of either the profession or the public? Without doubt it suggests competition for everything, and practising architects know very well that many things are now put to competition that there is really no excuse for, and that the building owner himself or themselves would be far better served had they taken a responsible and experienced member of the profession into their confidence at the start, and carefully evolved the best solution of the problem according to their requirements. This wholesale scattering of "suggestions for competitors" is gradually teaching every little building committee to believe that it is just as essential to advertise for plans as it is for tenders, and they are frequently foolish enough to suppose that the one does not involve a greater sacrifice to the competitor than the other, whereas the ratio of expenditure is about twenty to one to the victims of the system. I have really been pained beyond measure when I have seen the enormous amount of money and labour expended by architects upon fruitless competitions, and often with the additional wrong of seeing many of their original features plagiarised in that or some subsequent work.

Last year I was taken up rather severely by some representatives of the Press, and very kindly treated by others, because of my criticisms upon London, its streets and general want of method in laying out. I have again read what I then said, and have nothing to retract. I have lately visited Berlin, where the improvements being carried out in all directions make those of London appear very small and insignificant by comparison. And although Berlin is not altogether free from the advertising fiend, yet he is checked and controlled there in a manner that makes it comparatively inoffensive by the side of what we have to tolerate. In fact, in our chief centres, metropolitan and provincial, this craze for big letters and vulgar advertising is becoming so rampant that it will be a complete waste of time and money to design any good architectural features. If our civilisation continues to develop in the direction it now appears to be taking, the street façade of business premises will be as near an approach as can be got to a railway station wall with a hoarding. Why can not there be municipal by-laws subordinating these horrors to local control as much as for other things which offend the senses less?

It is a matter of great satisfaction to observe the improvements that are progressing in the eastern Strand and thence to Holborn. As these develop, so will public appreciation of them be intensified, especially if care be taken by the County Council to regulate with some regard to fitness, symmetry and proportion buildings that may be in juxtaposition to each other. Already the clearances, opening out the façades of existing buildings, show the observant what would be the effect could some of London's best buildings, jammed away in narrow alleys and back streets, be only so opened up.

In Whitehall, too, two stately blocks are rising, only to show what a grand opportunity was lost when the late Sir Charles Barry's scheme was abandoned, as well as to show how narrow and insignificant the neck of the bottle towards Trafalgar Square will look when these are finished.

It was a great mistake in the history of the Metropolis to have ever abolished the small duty on coal and wine that provided the funds for such a grand improvement as that of the Thames Embankment. If those two small imposts had continued there might have been by this time many more of such improvements, and no one would have seriously felt the tax, whilst all would have benefitted by its expenditure upon objects of this kind. We have, however, now new local municipalities all over the Metropolis, with more extended areas than the old vestries, a stronger and keener individuality, with probably a *personnel* with a higher standard of intelligence and taste. Let us hope that they will make the best use of their opportunities, and that this London of 1902 may have improved as much in the next decade as it took at least three decades before to accomplish.

Much will depend, too, upon their officials, and among them will be, I hope, what it appears from the opening address of Mr. Alfred Darbyshire, the worthy president of the Manchester Society of Architects, has been recently established in that progressive municipality, a "city architect," whose duty it will be to advise the Corporation upon all such questions. With a city or borough architect for each metropolitan municipality to advise the several corporations upon questions of public taste and public improvement, with a few well-considered additions to the by-laws in the matter of signs, advertisements, and chimney-stacks, this Metropolis of ours would soon begin to be more endurable, and assimilate more nearly with those places on the Continent where such matters are kept within reasonable control.

We have, too, our County Council, that the Legislature no doubt intended to act as the central controlling body, and when the new "Hôtel de Ville" of London rises from some conspicuous position on the banks of the Thames, let us hope that it will contain the accommodation for the proper display and careful consideration of all schemes for the improvement and beautification of the Metropolis, where the members and the officials of the subsidiary municipalities may confer, and so utilise the machinery that Parliament has created for making London gradually a harmonious whole.

In the provinces the two architectural works that stand out just now perhaps more conspicuously than any others are the two cathedrals. One, Truro, just approaching completion; the other, Liverpool, just in the throes of the second competition. Truro is now so far advanced that we can pretty well realise what the effect will be when the scaffolding and hoarding come down. Future generations will, I think, recognise in it one of the most perfect specimens of Mediæval art in the kingdom, the architect of which had the opportunity of designing a complete edifice, though unfortunately not to witness its completion. The name of Mr. J. L. Pearson, R.A., will go down for all time as one of our most skilful Mediæval architects, and the building, though of course not nearly so large, will take rank alongside of Lincoln or Salisbury for artistic merit. In its planning and in the grouping of its various parts, whether externally or internally, it will always preserve its

identity as a striking Mediæval cathedral church with an individuality of its own. It is a pity that for economic reasons some of its most prominent mouldings are executed in a soft stone, where from greater exposure to atmospheric conditions it is bound to decay first, but it will outlive this generation and possibly this century, when those who come after will have a comparatively light task to renovate it, if compared with that undertaken by the generation now passing away who put it there.

Of Liverpool we can say little yet, only await with great curiosity the design finally selected. When that appears it will be a matter of great interest to observe how far a modern cathedral for a great population like Liverpool departs from the old-established lines of Mediævalism.

But we cannot all be designing and building cathedrals, so in conclusion I will get back again to the commonplace everyday side of our profession by saying that there is work of some sort for every one of us to do. Let us do it well, honestly and conscientiously, producing the best result that is possible with the means at our disposal. Let us by all means in our power keep up the prestige and esprit de corps of our profession, then we shall earn the respect and confidence of our clients, and if we don't make large fortunes, shall, I hope, make respectable livelihoods and be considered worthy members of society.

### MANCHESTER SOCIETY OF ARCHITECTS.

A MEETING of the Manchester Society was held on the 13th inst., under the presidency of Mr. Alfred Darbyshire, when sixteen sets of drawings were on view, submitted by students in the competitions organised by the Society. The President read out the list of prize-winners as follows:—Sketches in connection with the Society's summer visits to old buildings: First prize, Mr. Frank Dyer; second prize, Mr. H. B. Laycock. Measured drawings of old work: First prize, Mr. R. J. Vernon; second prize, Mr. G. S. Salomons. Essay on the Renaissance in England: Mr. Spencer H. Oldham. Monthly classes of design, the subject being a row of eight small houses: First prize, Mr. Harold Hill; second prize, Mr. Frank Osler.

A paper was read by Mr. Halsey Ricardo on "The Revival of Gothic Architecture." In the course of it the author said that Mediæval architecture was the expression of a popular enthusiasm for building which went hand in hand with the piety of the people. It was popular and it was sincere. The architecture of the Renaissance was individualistic; it was not popular; it was infidel and insincere. The Mediæval churches and cathedrals were raised by guilds of craftsmen assisted and furthered by the people around them. Architecture became dependent upon great patrons who supported it from without, when it had previously been inspired from within, and with this change all the arts became an inexplicable cult for the rich and the leisured; the craftsman only co-operated in ignorance and without heart. Of the architect leaders of the Gothic revival in the nineteenth century Mr. Ricardo named Pugin, Street, Burges and Butterfield. Before Pugin's time, broadly speaking, such Gothic architecture as was being produced was Gothic in seeming only. That the author of the Waverley novels should inhabit a Gothic structure at Abbotsford was but natural and proper; nay, it was almost incumbent upon him, as well as consonant with his taste, and Mr. Blore, his architect, was ready to fall in with so amiable a whim. So various territorial magnates considered that it was due to their ancestry that they should be living in Middle Age castles, and therefore they transformed their Georgian dwellings into battlemented, machicolated imitations of the defences of the barons when war raged throughout the land. But with Pugin a deeper note was struck. For him the Middle Ages contained the true gospel, the Roman Catholic religion, the true faith. He set himself to reproduce the conditions of past times, old methods of life, old methods of construction. He saw well enough that to effect this properly he must reproduce the Mediæval workman, and, so far as he was able, he established workshops and schools in which to train his men. To us now, with our extended sources of information, the learning of Pugin did not seem so colossal as it appeared to those of his own day, whilst the substitutes and imitations of the real effects that he was trying to reproduce abated in us something of our esteem for his sincerity. But through his work breathed a spirit of lofty piety that kindled and purified what he did. The work of an ardent, beautiful soul, it stood a possession to us, the record of the ferment and the passion of the mid-century, and made valuable by the quantity of noble feeling it contained. Street was also passionately in earnest, but on him was more thrust the weight of modern conditions. The churches he built were for Reformed congregations, and though he and his school of thought tried to some considerable degree to ignore these reforms, yet there was much that had to be accepted. In his mind he recognised this and desired to accept it loyally, but the spell of the past was on his

heart, and his terrible facility with the pen carried him beyond the limits that he had appointed to himself. The attempt to recall features that once had life and bid them live again because they were endeared to us showed itself in the great hall of the new Law Courts. When that design was clubbed and bludgeoned down by the Government into less than half the area that it properly and originally demanded, it was clear that the attempt to preserve the hall was a fond one, and that in good sense the hall should go. The hall was built to the cruel detriment of the comfort of the Courts, the great vaults hang over it gloomy and deserted. It was his heart's darling whilst he lived, and now that he is dead it serves mainly to guard and enshrine his monument. In William Burges they had another temperament, and in the main cast of it far more Mediæval, and "there is a kind of sunny laugh in the buildings that grew up under his hand." Burges carries us back to the days of the "Decameron," and puts one amongst Boccaccio's audience. One was startled to find how vivid and real the dream is. He picks up the tools of the Mediæval craftsmen with an echo of the laughter of hundreds of years ago, and works his stone with so convincing an air and so much humour that it surely must be quickened into life. Burges had the power of transfusing himself among his craftsmen. His sculptors and painters kindled at his ideas and played up to them. Burges told us of doughty deeds and perils 'scaped, of damsels under enchantment, of wizards overthrown; we had "Ivanhoe" and "The Talisman" over again in terms of stone and painting. The last name in connection with the Gothic revival was that of Butterfield, and it was his special and lasting merit that he was more than a revivalist architect. He studied the Mediæval buildings with a closer and deeper analysis than Pugin, and with a greater reverence than Street, and set himself to build for the necessities and ritual of the present day, using the Gothic vocabulary as his mode of expression. But there was no co-operation from his workmen—everything was settled down before the work was begun, down to the last detail, and no growth was permissible beyond what had already been foreseen. But he knew his materials well, what they had done, and what they could do, and throughout his work they have a contented air, widely different from the usual tired look that most walling has. The canons of taste, Mr. Ricardo said in conclusion, were now clamouring for simplicity, showing how tired we had got of the trapping and upholstery of past styles, and how insufficient they were to hold our interest after their novelty had worn off. In this simplicity lay our hope that we might touch the heart of things, take our problems loyally and frankly and try to work them out in common sense, using our knowledge of construction to further our powers of design, not to cramp them by enabling us to raise buildings of impossible appearance, and our knowledge of what had been done in past time to be our guiding spirit in respect to the aims, the methods and the piety of the master builders—our forefathers.

A vote of thanks was passed to Mr. Ricardo for his address.

### FERNS CATHEDRAL.

THE Cathedral of Ferns, which for the past year has been undergoing a thorough restoration under the direction of Mr. Fuller, architect, has now been reopened. The original structure, erected about the end of the thirteenth century or beginning of the fourteenth, and built on the site of the ancient Oratory of St. Mogue, the first Bishop of Ferns, to whom it was dedicated, was evidently one of imposing proportions and great beauty, with nave, aisle, choir and chancel. In the fifteenth and sixteenth century the cathedral suffered much: Bishop Kane found it in ruins, the nave or centre aisle only being fitted up for Divine service. The nave, somewhat enlarged, seems to have undergone frequent "restorations," in which every trace of the original building was gradually obliterated, the tracery of the walls ruthlessly broken, the beautiful clustered pillars which supported the arches between nave and aisles built up into the walls and plastered over, so that it was generally thought that no portion of the present building belonged to the original structure. The present restoration has been undertaken in a different spirit. The ancient pillars have been exposed and repaired, and other portions of the original cathedral which were brought to light preserved with loving care. A new chancel arch has been erected, and the prebendal and choir stalls placed within the chancel. The old ceiling has been removed and the roof lined with pitch pine. New seats have been provided, the floor tiled throughout, and a new system of heating by hot water introduced, and many other improvements effected.

The Chapel of the Bishop Otter College, Chichester, was dedicated on Saturday. The enlargement was carried out from designs by Mr. Gordon P. Hills.

## NOTES AND COMMENTS.

THE Court of Appeal appears to be afraid of the inconvenience which may be caused by the mass of details involved in an architect's claim for fees, and therefore will not aid in having the claim heard in court. Mr. HALL, an architect of Leicester, is the plaintiff in an action for the recovery of fees, the defendant being a local builder. One of the Masters made an order that the case should be referred to the Official Referee, and Mr. Justice DARLING approved of that course. The subject was brought this week before the Court of Appeal. Counsel for plaintiff sought to have the action tried in the ordinary way by a judge and jury. It was stated that the question was not one of the scale on which the architect was entitled to fees, but the meaning of an agreement between the parties. The plaintiff put in fourteen items of particulars, and the defendant admitted four of them which were in respect of certain extra work. With regard to the other ten items, plaintiff agreed to do the work for remuneration at the rate of 3 per cent. on the total outlay, and the only question raised in the defence was whether these ten items came within the scope of the agreement at all. Therefore, the question for decision was one of principle, and the case should not have been referred to the Official Referee. What influenced Mr. Justice DARLING in making the order was that there was another action pending by the plaintiff against two co-defendants, one of whom was the present defendant. Both actions were referred, although each related to a different building, and raised totally different questions. Lord Justice ROMER asked whether if the case went before a jury they would have to go into the nature of the work? Counsel, in reply, said the question was simply whether the contract applied to all the work the plaintiff had to perform, and the Official Referee was not the proper tribunal to try such a question. Counsel for the defendant said it was not a bare question of principle, and it would not be fair that there should be two trials, firstly as to the question of principle, and afterwards as to the details. Lord Justice ROMER said it was clear that to allow the case to be tried first at the assizes, and then referred on questions of detail, would result in unnecessary expense. Mr. Justice DARLING was right in referring the whole matter to the Official Referee, and the appeal would be dismissed with costs. Lord Justice MATHEW concurred.

If ever a work of art could be employed as an example of the "Illusions Perdues" of BALZAC it is the statue of the novelist. M. RODIN accepted the commission for the work in the hope of producing a work that would be worthy of so great a writer. He modelled several figures, but not one of them was considered acceptable by the Société des Gens de Lettres. Then with much misgiving the late M. FALGUIÈRE undertook the work, but he did not live to complete it. An arrangement had been made that M. ANATOLE DE VASSELLOT was to execute reliefs representing scenes from the "Comédie Humaine," which were to adorn the pedestal. M. FALGUIÈRE approved of it, and the two sculptors came to an understanding on the subject. The reliefs were exhibited in the Salon. But after M. FALGUIÈRE'S death Madame FALGUIÈRE expressed the desire that the statue of BALZAC should stand on a pedestal from which reliefs that might attract the attention of the spectator away from the principal figure should be absent. The committee have decided to accede to the desire, regardless of the earlier arrangement. M. DE VASSELLOT'S expectation of being allowed to offer a proof of his admiration of BALZAC is therefore at an end, and adds one more to the illusions which the memorial has created.

ALTHOUGH his name denotes an Italian family, M. JEAN RAFFAELLI is a native of Paris. He is likely to associate that name with a new variety of painting. M. RAFFAELLI has discovered a method which will hold a relation to oil-painting corresponding with that of pastel to distemper or water-colour painting. The colours are manufactured in the form of ordinary crayons, although the size is doubled. They are in a medium state, between softness and hardness, and little practice is needed to apply them to canvas or paper. This dry mode can produce effects similar to those obtained with oil colours, and, as far

as the tests go, the durability appears to be equal. Painters may complain that they will not have the satisfaction of preparing subtle combinations of colour by the new process, but M. RAFFAELLI'S exercises with his special paints are suggestive of combinations without number. For travelling painters and for several purposes the new method has peculiar advantages. An exhibition of works produced by the materials will be opened in Paris on the 24th inst., and the pictures will subsequently be shown in London, Berlin and New York.

THE negotiations for the possession of Stonehenge as national property have been renewed. On the invitation of Sir EDMUND ANTROBUS, there has been an interview with him through Lord EDMOND FITZMAURICE, chairman of the Wilts County Council. It is considered to be premature to make any announcement now, but it is anticipated that in February his lordship will be able to communicate the result to the Council. It was recently said that the value of Stonehenge was not included in the proposed sale to the Government of a large tract of land, amounting to several hundred acres, near Vespasian's Camp, for a sum of from 125,000*l.* to 150,000*l.* What occurred was that at the time of the former negotiations there was an entirely separate valuation made of what might be fairly considered to have been the increased value of the Amesbury estate when bought by the predecessors of Sir EDMUND ANTROBUS from the fact of Stonehenge being on the property. This sum was, however, brought within the limit of the above-mentioned 150,000*l.* at the time of the negotiations referred to. When Sir EDMUND ANTROBUS is charged with wishing to sell Stonehenge itself for 125,000*l.*, the statement is not correct. At present there is hope that a satisfactory conclusion will be reached.

## ILLUSTRATIONS.

CATHEDRAL SERIES: HEREFORD. EAST WALL OF NORTH TRANSEPT.

THE TEA HOUSE, REIGATE HILL, SURREY.

THIS has been built upon the summit of Reigate Hill, on the main road between London, Epsom and Brighton, and is much frequented by cyclists and travellers. On the ground floor are coffee and smoking-rooms (with communication to verandahs) and a lounge hall. In order to facilitate serving, the kitchen department is also on the ground floor. On the first floor are bath and bedrooms. In the basement, which is arranged by the fall of the ground so as not to be underground, are well-lighted store rooms, manufactory for mineral waters, and large cellars for storing same; a bicycle-store is also provided. The external walls are hollow and the majority finished with rough cast of a pale yellow tint and half timberwork, tarred to a dark colour, introduced in the upper portions. The chimneys and piers of verandah are in local sand-faced red brick. The porch is lined with Farnley glazed bricks of moss-green colour, and the verandahs with panelling stained the same tint. The columns, on glazed brick piers, at entrance are of English oak, simply oiled, carved on the spot, with the tea flower introduced in the caps. All the wrought-iron work of sign, hinges, barge brackets, &c., were to special design and were executed by local craftsmen. The roof is covered with Maidenhead sand-faced, hand-made tiles of a rich red colour.

Mr. CHARLES E. SALMON, of Reigate and Wallington, is the architect.

BURTON COURT, SLOANE SQUARE.

DACRE HOUSE, WESTMINSTER.

THE GREAT HALL, STATIONERS' HALL, LUDGATE HILL.

NEW PREMISES, TWICKENHAM.

THE builders of the premises we illustrated last week were Messrs. W. H. GAZE & SONS, contractors, of Kingston-on-Thames, the constructional steelwork and fire-proof flooring being by Messrs. A. D. DAWNAY & SONS, LTD., the granitework by Messrs. J. WHITEHEAD & SONS, LTD., lift by Messrs. R. WAYGOOD & CO., LTD., sun-blinds by Messrs. L. W. FRANCIS & CO., LTD., and turret and covering by Messrs. F. BRABY & CO., LTD., the architect, as mentioned last week, being Mr. THOS. R. RICHARDS, of Bedford Row Chambers, 42 Theobald's Road, W.C.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, A.R.A., president, in the chair.

## All Hallows Church, Lombard Street.

The SECRETARY read the following resolution, which was passed by the Council at a meeting in the afternoon:—

"That the R.I.B.A. views with regret the proposed demolition of another of Sir C. Wren's churches, which has a peculiarly successful interior, and desires to express the hope that means may be found to preserve the building intact. But if circumstances prevent this, that the church should, if possible, be re-erected upon a suitable urban site stone by stone, and in any case that the fittings should be suitably rehoused in a building of the same character, where the whole could be brought together so as to preserve the unity of their design."

Mr. F. C. PENROSE read a paper on

## The Origin and Construction of the Ionic Volute.

He stated that several methods had been proposed for the construction of the Ionic volute by means of finding centres for quadrants of circles which may give some approximation to the appearance of the true figure of the Greek originals, none of them very successful. That of Goldman seemed to be the best, but it failed altogether to give the proper proportional expansion of the spaces between the lines, nor did the four arcs in each convolution at all represent the beauty of the continuous gradation of Greek originals. The origin of the volute, sought for in Assyria, Egypt and elsewhere, the author derived from Greece itself, as the scheme he was about to explain enabled the exact figure of any true Greek example to be reproduced. In archaic Greek work, and particularly in the decorations of the Mycenaean period, one constantly found the form of scroll in which every convolution of the spiral followed the first at equal intervals. This decorative scroll had no doubt been formed mechanically, as could easily be done by unwinding a string from a cylinder, forming a figure known as the involute of the circle. The question presented itself, How could a spiral having the character of the ammonite be produced? If the operator drew upon wood—or some other suitable material—the involute scroll, such as he had been accustomed to, and by shallow carving or otherwise raised the edges a little so as to form a helix, and allow a string to be wound round those edges, and then unwound over a flat surface having a marker at the extremity of the string, he would produce the expanding spiral he was in search of. It did not give correctly the figure of the ammonite, but it had all the requisites of proportional expansion and perfect variation of curvature at every point, and coincided perfectly with Greek volutes.

The author gave two examples from Ephesus—the first from the archaic Temple of Diana. In all later examples known to the author the two central convolutions of the spiral, nearly so, were interrupted and concealed by the circle which formed the eye of the volute. In this case, however, the curve which would be evolved from the helix was allowed to extend from the central origin of the volute up to its junction with the abacus. By drawing a straight line through the central origin to the circumference on both sides a calculation could be made to find a helix on the involute principle, and this, when worked out, would be found to agree not only with given points on the circumference, but to correspond with the other convolutions also, and could therefore be extended to the whole of the volute. This correspondence clearly showed that the method of the involute spiral was that which was used by the architect employed by Croesus.

The volute of the later temple at Ephesus, the second example, had almost the same curvature, the only difference being in the surface moulding and the circular eye which occupied its centre. In the majority of the examples known the eye of the volute was a separate piece from the main mass of the capital, and was formed by some kind of boss of marble or metal inserted into a circular hole prepared for it, centred very nearly on the place of the pivot of the helix, and always of sufficient diameter to receive it. Such an arrangement would have had obvious convenience for fixing the helix.

The volutes in all the examples in Asia Minor were probably described by means of helices similar to that mentioned above. But the Athenians demanded greater variety than that spiral so used could supply, and gave to their volutes additional expansion in the exterior convolution; still, however, working by means of the involute form, but differently treated. This applies to the Propylaea, to the three orders of different size in the Erechtheum and to the Temple of Nikè. It was also used in the temple on the Ilyssus, recorded by Stuart, and in the principal temple at Bassæ. With the exception of this variation in the exterior convolution in Athenian structures, the same general scheme seems to have been employed in all true Greek examples, and the only liberty of choice given to the

designers lay in the proportioning of the width of the volute to the upper diameter of the column, and in that of the interval between the convolutions of the generating helix, in the size of the eye compared with that of the volute. This would have some effect upon the number of convolutions to be used, which vary in the cases the author had examined from four (that is, measured from the origin) at Priene, to two and a quarter in the case of the Erechtheum. The intervals of the helix would determine all other variations. The variations in the above-mentioned elements, as found in certain examples, were shown in a table of calculations. The two different descriptions of volute he termed the Asiatic and the Attic.

The author next gave a description of the helix for describing the Greek volute, and detailed the method of its employment both in the Asiatic form and the Attic variation, illustrating by various diagrams and giving a table of calculated measurements. Mr. Penrose proved the accuracy of his method by showing that examples of volutes on the east portico of the Erechtheum and at the Propylaea, worked out in the way he had described and from data given by the table, were found to be in exact agreement with the records made by Stuart of the Erechtheum and by Mr. T. J. Willson of the Propylaea.

Before concluding, the author gave an interesting description, illustrated by diagrams, of the helix (one from which a string may be unwound so as to produce the volute) employed by him in drawing the models exhibited, and suggested the adoption of a similar contrivance where a Greek volute had to be carved.

Dr. A. S. MURRAY read a short paper, entitled

## A Fragment of the Parthenon Frieze.

Before dealing with the subject of the lately recovered fragment of the Parthenon frieze, Dr. Murray mentioned another important find in the same neighbourhood. A year or more ago he received from a clergyman a copy of a Greek inscription on a piece of marble in a rockery in Essex. It turned out to be an inscription which had been missing since about 1771, in which year it was published in the "Archæologia of the Society of Antiquaries." The story was that Stuart, when in Athens preparing the drawings for his famous book, had picked up this inscribed piece of marble, and given it with some fragments of bas-reliefs to a ship captain to take to Smyrna, where he intended to get it on his way home. When, however, Stuart next saw the marble, it was in the hands of a Mr. Jones, of Finchley, who had received the inscription and the fragments of bas-reliefs from a captain in the navy. How long the inscription remained at Finchley is not known, but just about then there was a well-known antiquary, Thos. Astle, much interested in ancient alphabets, and presumably the sort of person who would like to possess the beautifully inscribed stone. At all events, it was on an estate in Essex, once belonging to Thos. Astle, that the inscription had lately been recognised. The inscription is of no little historical interest, being part of a monument erected in Athens in honour of volunteers from Cleonæ who had fought on the side of the Athenians (457 B.C.) in the battle of Tanagra against the Lacedæmonians and Eubœans. Stuart states that he had found the inscription near what he calls the ruins of the Stoa Pœcile or Painted Porch. Some additional fragments have since been picked up in Athens. When the copy was sent it was noted that an important part of the inscription was still missing. Since then, however, a son of the present owner of the estate had found that part in digging round the rockery. Both pieces have now been moved into the house. The larger piece has a bleached appearance from long exposure to Essex weather, but the fragment lately dug up looks as if it might have been brought from Athens the other day. Two or three months ago the gardener, in digging beside the old rockery, came upon what has turned out to be a fragment of the Parthenon frieze. It was first identified as such by a young medical student, Mr. Aliston Glover, who had visited Athens and was familiar with the style of the sculpture. He called upon Dr. Murray with a photograph, which enabled them, together with the exact dimensions, to determine at once the slab in the museum from which it had been broken off. Though found under the earth, the fragment must have been long exposed to severe English weather. Down the face of the sculptured horseman the rain has driven furrows, which take away some of its charms. This fragment does not appear in any drawings made previous to Lord Elgin's time. It had fallen before then, most likely during the gunpowder explosion within the Parthenon in the seventeenth century. The want of any play between the slabs, owing to the excessively fine joints of the frieze, was sure to be a source of mischief should the building be shaken or subside in its foundations. This, no doubt, is the reason why so many of the corners of the frieze are wanting; possibly there may be some more of them in English gardens.

Considering the facts that Mr. Jones, of Finchley, possessed several fragments of bas-relief as well as the inscription, and that Stuart had sent home some such fragments with it, Dr.

Murray was inclined to think that this fragment of the frieze had reached Essex along with the Greek inscription and had been sent home with it by Stuart. Thos. Astle was in his time a trustee of the British Museum. But that was in the pre-Elgin days, when the Towneley marbles were regarded by Dilettanti as the perfection of ancient sculpture. A fragment of the Parthenon frieze would have counted for very little then.

Dr. MURRAY showed a photograph of the slab to which the Essex fragment belonged, which represents a part of the cavalcade of young Athenians who rode in the Panathenaic procession through the streets of Athens every fifth year. A photograph, with the fragment added in its proper position, was also shown. In conclusion, attention was drawn to some specially interesting details of this portion of the frieze, and to the skilful devices employed by the sculptor to avoid monotonous repetition and arrest the attention of the spectators.

Mr. H. H. STATHAM, who proposed a vote of thanks to the readers of the papers, said it would be very difficult to follow out Mr. Penrose's theory from the first reading of his paper. He had shown them how to draw volutes by continuous lines instead of by a succession of circles, and all those who drew volutes were indebted to him. It seemed hard to believe that the Greek volutes could have been developed from a succession of circles.

Dr. C. WALDSTEIN seconded the vote, and he offered his cordial congratulations to Dr. Murray on the brilliant discovery which had been made and to the Institute for being the first society to whom it was made public. They could all measure the importance of finds, not quantitatively, but qualitatively, and though it was but one small figure relatively considering the great mass of figures in the Parthenon, yet the small fragment should be as important as many discoveries of merely decorative works.

Professor BERESFORD PITE said the Institute had unusual reason to congratulate itself for such a communication as they had had from Mr. Penrose. The circumstance was unique. It was very interesting that the little excursion to the Acropolis had been conducted by Mr. Penrose, accompanied by Dr. Murray, and then the exploration in the Essex garden to prove such a valuable and charming treasure added special interest to the evening and to the enthusiasm of the meeting. He expressed the hope that when Mr. Penrose's theory was considered in detail it would not be so hard to understand as it appeared to be from the reading. Mr. Penrose had let slip the remark that what was possible to the good Greek workman was possible to the good English workman, and therefore it would seem that that which was possible to the Greek architect was possible to the English one of later days. If all the wonderful Greek capitals were made by measurements then the old theory that used to be battled, that all Greek curves, because they were beautiful, must have been drawn by the free hand of some architect's pencil, was still assailed. The theory that the architect's pencil had no reason to enter into the work was applicable by what Mr. Penrose had put before them.

Mr. T. BLASHILL and Mr. R. PHENÉ SPIERS supported the vote of thanks.

The PRESIDENT, in concluding the discussion, said modern architects, after what they had heard from Mr. Penrose, must be struck with a sense of feebleness and despair in their own work when they realised that after over two thousand years they were still searching for the secret of one small detail in Greek architecture. They must feel how immeasurably inferior they were in their work to that carried out in those much earlier times. The Greeks attained their refinement through scientific methods, and in modern buildings the rule would also apply; artistic results were not achieved otherwise. With regard to Dr. Murray's paper, they must all rejoice at the discovery of the fragment of the frieze, and their satisfaction would be complete if he was able to tell them that the fragment was to be added to the portions at the British Museum. There could be no doubt that this was the only place where it could be placed.

Mr. PENROSE and Dr. MURRAY returned thanks. The latter said he could say very little as to the Essex fragment. He believed it would go to the Museum, but he would rather not tell its whereabouts in the county.

**Remains of Old Work** have been discovered at Peterborough during excavations for underpinning the Knights' Chamber gateway in the cathedral precincts. About 15 inches below the present level the workmen came upon the ancient wall seat *in situ*. About 18 inches below this was found the original well-worn paving of monastic days. The original level was therefore nearly 3 feet lower than the existing one, and corresponds to the pavement level of old Peterborough, which is often met with in town excavations, and which coincides with the floor-level of the parish church.

## PRESENT CONDITION OF THE LIGHT AND AIR QUESTION.\*

MR. PRESIDENT and Gentlemen,—At the invitation of your Council, I have very much pleasure in acceding to their request to read a paper before you on the much vexed question of light and air, more especially because at the present time recent legal decisions and the actions of the Councils of the R.I.B.A. and Surveyors' Institute have brought this subject under prominent notice, and it is essential that all of us should carefully consider the present position.

I do not propose to go into the physical properties of light, as these are so familiar to us all.

With regard to the historical aspect of the case, light and air have received consideration as important commercial factors from very early times.

In the Roman law they were regarded as "*res communes*." Therefore the right does not consist of a title to possession of light and air, but in some obligation to refrain from using certain land so as to materially interfere with the light and air which will pass over the land to the tenement to which the right is annexed. Thus the old maxim of law "*cujus est solum, ejus est usque ad cælum*" is modified to this extent.

In the English law, previous to the year 1832, the right to the enjoyment of light and air was acquired only by prescription at common law, *i.e.* evidence had to be produced to go back as far as "the memory of man had not run to the contrary," and this was settled as being the commencement of the reign of Richard I. (A.D. 1189).

By the Statute of Limitations passed in 1623, adverse uninterrupted possession for twenty years gave a sufficient title to land, and it was also held by the judges that such possession was evidence from which a jury might presume a grant, provided that it was "*nec vi, nec clam, nec precario*."

In 1823 Statutes of 2 and 3 Will. IV., commonly known as the "Prescription Act," placed the length of time definitely at twenty years. As, however, an interruption of such user must be for at least one year, it follows that nineteen years and one day is sufficient time to acquire the easement. Curiously enough, however, the Courts will not grant an injunction until the full period has elapsed, but in the event of the right being infringed before the twenty years has expired will wait till the period is completed (*Flight v. Thomas*, 11 A. & E. 668; *Bridewell Hospital v. Ward*, 62 L. J. Ch. 270, 1893).

### Acquisition of Easement.

An important point for the gentlemen of our profession to remember is that under the Conveyancing Act, 1881, a grant of light is deemed to be included in the conveyance. And even where adjoining land was marked as "building land" on the deed plan, this was held by Lord Justice Lindley not to show a contrary intention with regard to section 6, subsection 4 (*Broomfield v. Williams*, 66 L. J. Ch. 305).

Easements are also acquired by implied grant. The principle underlying this form of grant is that a man cannot derogate from his own grant. This form of case frequently arises in the development of building estates, where specific covenants as to easements are not inserted in the lease.

Where a man built a house and then sold it, and afterwards sold the land adjoining, it was held that the purchaser of the latter could not obstruct the light of the house (*Palmer v. Fletcher*, 1 Sid 167).

More recently, even where the plaintiff had obtained her lease upon a building agreement, and where the adjoining land was marked out in building plots, and so shown on the plan, it was held that there was nothing to give the grantors liberty to interfere with the access of light to the plaintiff's house (*Pollard v. Gare*, Ch. Div. 834, 1901).

### Commencement of Easement.

It is well to remember that the twenty years commences to run practically from the time that the carcass of the building is completed, and that the enjoyment by occupation is not necessary (*Courtauld v. Legh*, 4 Ex. 126, 1869). The mere fact of pulling down does not operate as a loss of the easement (*Ecclesiastical Commissioners v. Kino*, 14 Ch. Div. 213). Any lights that are built in the new buildings are protected as far as may be by the positions of the previous lighting superficie (*Tapling v. Jones*, 11 H. L. C. 290, 1865; *National Provincial Plate Glass Company v. Prudential Assurance Company*, Ch. Div. 757; and *Scott v. Pape*, 31 Ch. Div. 554).

We have already noted that the easement may be lost by the obstruction for one year. It may also be lost by abandonment.

### Intention of Abandonment.

The question that the Courts always inquire into is the intention. In one case in which a plaintiff had ancient light he blocked them up; but it was obvious from the outside that

\* A paper read before the Birmingham Architectural Association by Mr. H. Phillips Fletcher, F.R.I.B.A., F.S.I., A.M.I.C.E. Barrister-at-law.

there had formerly been windows. Nineteen years later the defendants erected a boarding to obstruct such windows. Held that lights were not permanently abandoned and verdict for the plaintiff (*Stokoe v. Singers*, 26 L. J. Q. B. 257).

In another case it was held where a window had been partially covered by shelving that there was no intention of abandonment (*Smith v. Baxter*, Ch. Div. 138, 1900).

#### *Estimating Injury.*

This portion of our subject is certainly the most difficult that confronts us. Professor Kerr and Mr. Homersham Cox both had excellent theories for the mathematical calculations of loss of light and air, but as the Courts would not accept them it would not be very profitable to discuss them. You will see various diagrams around this room that were prepared in the endeavour to illustrate the effect of alleged infringement to easements of light and air. It may, perhaps, be mentioned that the diagrams before you have in every case, whether for the plaintiff or defendant, been successful in either obtaining a verdict or in arriving at a successful compromise. It is impossible in the limited time to attempt to explain them.

You cannot make stock diagrams for stock cases, and each case has to be very carefully thought out with a view of preparing such drawings as will fairly show the effect of the new buildings upon the easement.

Architects as a rule (myself among the number) get very annoyed at having a building stopped owing to an action for light and air.

But we should remember that, after all, the latter is as much an easement as rights of support, way and water, &c., and that a party may have bought a building because it was exceptionally well lighted.

I had a small clinometer made for use on buildings. By his instrument one can obtain fairly accurately the angle loss of light on the site, and if any gentleman present cares to have one made on similar lines I should be very pleased to lend it to him for use as a model.

In the October number of the "R.I.B.A. Journal" Mr. W. Quick has some interesting diagrams with regard to the sun's direction and position, together with the shadows affecting light and air.

He has, however, apparently neglected the fact that all windows are not necessarily lighted by direct rays from the sun; in fact, in towns a large majority are not so lighted, and, of course, artists and others could not use such rooms.

The study of astronomy is always interesting; but we fail to see that any benefit with regard to light and air can be derived from the diagrams and tables given. This information, if of any real value in the Law Courts, could always be worked out by a competent architect or engineer with the assistance of the nautical almanac. The Courts mainly consider this subject from the standpoint of the diffusion of light.

The final paragraph in Mr. Quick's letter is somewhat amusing, and we are glad that at last someone has discovered how to deal with a subject "in a moment," while Chancery judges very often take days to decide such questions.

Two recent cases in the Court of Appeal have put the law into a much more concise state than heretofore, viz. *Warren v. Brown and Home and Colonial Stores v. Colls*.

In *Warren v. Brown* (1900, 1 C.A. K.B. 15) Mr. Justice Wright's decision was reversed, and it was held that although abundant light was left for all ordinary purposes, yet that the plaintiffs were entitled to relief for the damage done by the defendant's buildings. Lord Justice Romer also said that at the present day, if ancient lights are interfered with substantially and real damage thereby ensues, that relief should be given, and in particular in considering whether a house has been substantially injured it is proper to have regard to the ordinary uses by way of habitation or business to which the house has been put, or might reasonably be supposed to be capable of being put.

Some houses, owing to their having numerous lights, are extremely valuable for purposes of habitation and business. In such cases a building owner cannot justify a substantial interference with such lights on the ground that other houses, or some imaginary standard house, are or is not better lighted than the injured house after the injury.

In the case of the *Home and Colonial Stores v. Colls* (1901, 8 T. L. R. 212) Mr. Justice Joyce, in the Court below, was of opinion that the selling and letting of the plaintiffs' premises were not affected.

The Court of Appeal, however, held that the plaintiffs could have to use more artificial light, and it was impossible to hold that there would be no "real damage," and a mandatory injunction to pull down was granted. Lord Justice Vaughan Williams doubted very much if the angle of 45 degs. can be regarded even as a rough measure of the right of the owner or occupier of ancient lights. This latter is very important, because, as before explained, each case must be decided on its own merits, and the effect of a distant building, even at the same angle as the one less remote, is not so injurious to

the dominant tenement, because the latter enjoys a large lighting area, consequently more diffused light comes to such building.

These two important cases therefore emphasise the following points:—

1. Substantial interference to light and air must be proved before the plaintiff can succeed in his action, not that which some person having fantastic or peculiar views might suggest is substantial diminution, but having regard to the views of some person of ordinary sense and judgment.

2. There is no supposed standard as to that which a house ordinarily requires by way of light for purposes of business or habitation.

3. When premises are well lighted, and certain businesses requiring much light are or can be carried on, these facts are not to be disregarded in considering the effect of the interference.

4. Lord Justice Cozens-Hardy suggested that in judging of the probable effect of the proposed building the Court may not unreasonably regard the fact that the angle of 45 degrees will be left as *prima-facie* evidence that there will be no substantial interference, and may require this presumption to be clearly rebutted by satisfactory evidence. Lord Justice Vaughan Williams strongly dissented from this point of view, and doubted if this could in any case be taken even as a rough guide.

5. The effect on the selling and letting value is not always a guide. Where plaintiffs are occupiers they are entitled to use their own premises for the same purposes as heretofore and with the advantages.

#### *Loss of Air.*

With regard to the loss of air *per se*, such loss is usually rather a difficult claim to substantiate. In recent years, however, the Courts seem to incline to consider damage to air as more serious than heretofore, and in 1897 the House of Lords, in *Chastey and Another v. Ackland* (L.T. 76, N.S. 430), intimated their intention of reversing the decision of the Court of Appeal, who held that there could be no right by prescription to air coming over the roofs of houses. The parties, however, came to a settlement by which the appellants agreed to accept a sum of money in settlement, the respondents agreeing to pay the costs in the Lords and the Courts below. So that we must not lose sight of the effect of loss of air upon a dominant owner's property.

#### *Conclusion.*

I would suggest to you that, though the dominant owner's hands have been materially strengthened by modern law cases, it is still incumbent upon us to remember that if we can make satisfactory terms with the building owner it is generally advisable to do so. Moreover, the wrecking of well-designed buildings by light and air cases is much to be deprecated, and we all ought to do our best and endeavour to make the buildings to be erected as worthy of our great Empire as may be.

To show the extreme bias that exists among some of us, an architect who is in large practice in London mentioned to me not six weeks ago that without any investigation he always declined to act for the dominant owner in light and air cases, but would always act for the servient owner. Surely this is scarcely the frame of mind in which to give evidence which will be any real assistance to the Courts.

Another architect said to me quite recently that he had given up trying to erect decent buildings in the City of London, because they were always cut about by light and air cases. My reply to him was that if he could study the law of the subject, he would know that which he could safely erect; and that if he would consult all the servient owners affected before commencing his building operations, his buildings and his clients would probably both be more satisfactory to him.

With regard to the proposals formulated by Councils of the Royal Institute of British Architects and the Surveyors' Institution, I scarcely think that the methods suggested will be of any real value.

The proposed procedure seems to leave legal points to be settled in the first instance by surveyors, and would also seem to render possible even more appeals than are at present permitted.

The question also occurs to one that if the law be altered with regard to the easements of light and air, why should it not be altered with regard to every other kind of easement which is obtained in precisely the same manner?

A counsel learned in the law was speaking to me the other day of the present crying need for healthier conditions in our houses and buildings, which could be insured by a freer access of light and air. He expressed surprise that some of the leaders of our profession—the highest aims of whom should be directed towards effecting these conditions—should endeavour to get a Bill through Parliament for the destruction of those private rights which are one of the few checks upon the annihilation of these elements.

We are liable at times to forget the legal and reasonable

rights of adjoining owners when we are unable to carry out a building in its entirety.

Perhaps from looking at light and air from this standpoint we are apt to take rather a one-sided view; but if we were to put ourselves into the place of a purchaser who had bought a building solely because of its dominant light, which latter was essential to his special business purpose, we should probably think that the law as it stands does not protect one sufficiently. No doubt there are some people who try to take an unfair advantage of the law as now laid down. But this proportion is small, and they can receive no support from practitioners of any standing.

#### NORTHERN ARCHITECTURAL ASSOCIATION.

THE opening meeting of the winter session of the Northern Architectural Association was held on the 12th inst. at 56 Northumberland Street, Newcastle.

The president (Mr. Frank Caws) occupied the chair, and delivered his inaugural address. He thanked the members of the Association for the honour they had again conferred upon him, and proceeded to say that their own profession of architecture in this north-eastern district had not progressed at a rate at all commensurate with the great march of local industrial improvement. They heard in these days not infrequently allusions to the so-called "new architecture" by the "new architect," but they found those were mere expressions; they looked in vain for the realities. New trivialities, new vulgarities, new monstrosities, new strainings and over-strainings after originality offended their taste and pained their sense of fitness and propriety at every turn in their walks through our streets, but they looked in vain for any substantial proof or promise of real architectural improvement. It was a sad thought, if a true one, that the old-world architects were and must ever remain the record-breakers of the profession. To have that fact borne in continually on the mind by the evidence of the mighty and majestic works of the oldest masters was depressing and deadening in such a degree to the young architect whose brother was, say, a chemist or an electrician, full of keen expectation of surpassing to-morrow the marvels of yesterday, that it was, perhaps, no wonder if he did occasionally "chuck" his profession from a feeling that it was scopeless and hopeless. There were young architects, and old ones too, who had never realised the difference between the limitations of progress which seemed to environ their own profession and the great scope of certain other professions which were apparently invested by a boundless sea of accessible new attainment. These architects might live and work content that the thing that hath been was the thing that shall be. Judging, however, by the frantically ridiculous struggles for "something new" which many modern architects were making, they were by no means at rest within their professional limitations, and seemed crazed with the craving for they knew not what. It could not be denied that with all its restlessness and pettiness and vain theatricality our most modern architecture was a more or less faithful reflex of the character of our age and generation, and certainly if they might forecast the future from the past, one of the outlets for the development of "new" architecture (whether improved on or not was quite another matter) was in the adaptation of new designs to the spirit and taste and fashion of the day. While deference to the fashion of his time is obligatory on the architect who did not desire to become unpopular, yet there was a great distinction between the deference which was servile and that which was conciliatory; and no architect in following fashion should fail to use his own trained taste and judgment in accentuating what he felt was good and in minimising what was bad in the type which he was affecting. Whether they liked it or not, undoubtedly the new architecture, such as it was, was being developed by the fashion of our day, and they must make the best they could of it. Perhaps if they "followed the gleam" and each did his best according to their opportunities to convert a glimmer into a dawn, they might be unconscious contributors of some new architecture which they could not now realise, except "through a glass darkly." They had at their command new materials and methods and appliances, and if they made themselves thoroughly acquainted with their nature and possibilities, and quite proficient in their application, they would necessarily, though slowly and to a large extent unconsciously, be contributing to the formation of that truly new architecture which was destined to gladden the eyes of future generations. The Northern Architectural Association was not able to supply souls to those of them who had not got any, but it helped students and members to become masters of the instruments, so to speak, of their profession. Mr. Caws proceeded to mention the numerous advantages derived from membership of that Association, and commended the classes carried on at the Durham College of Science. Their Associa-

tion was stronger than ever it was, and if they all pulled together, instead of finding fault, there was a bright future before them. If that Association in its first function as a professional tribunal and in its second function as an architects' social centre had achieved some measure of success, still more had it succeeded in fulfilling its third function as an educational agency. Proceeding, Mr. Caws remarked that the study of old works, both in books and buildings, not only informed the student of facts, but created, as it were, both a mental soil and a mental atmosphere, rich enough and rare enough to produce new and beautiful growths which could not have taken root and found sustenance in the stormy and thorny ground of the uncultivated mind. Every beautiful building, whether old or new, was an educator. The sense of fitness and propriety generally accompanied, if it did not help to constitute, the sense of beauty, and the more they were driven by force of circumstances to regard fitness as the chief aim of all their designs, the more pleasing and satisfactory would be their outcome. He thought their profession had suffered from attaching too much importance to exterior elevational design and too little to internal design. From the very nature of the case, and especially from the play of light and shade, the interior of a building was usually much more interesting and much more capable of artistic and poetic treatment than the exterior, and it seemed a pity that architects should leave to the professional decorator so much of the internal treatment as should more properly be regarded as the chief artistic opportunity of the architect himself. Concluding, Mr. Caws said no matter what materials were placed at their disposal, they would never be able to do justice either to them or to themselves unless they made themselves thoroughly conversant with those great physical principles which applied to all materials under the sun, and by the wise application of which every structural material was made subservient to the architect's dream. Those principles were strict, straight, stern and strong, and formed a backbone to any structural scheme to which the architect properly applied them. While they should lean hard on those principles, their imagination must not be neglected, for art, as well as science, claimed devotion. It might be that few succeeded throughout their professional career in preserving that true balance between science and art, between faithfulness to truth and the worship of beauty which was characteristic of the genuine architect. To maintain that balance was a great struggle for even the strongest intellect and will, but it was the struggle to which their profession called them, and if they succeeded in it the greater was the glory that the strife was hard.

The hon. secretary (Mr. A. B. Plummer) read the award of the assessors (Messrs. F. Caws and R. Burns Dick) in connection with the offer of prizes by the ex-president (Mr. W. Glover) for the best sets of testimonies of study drawings prepared for the R.I.B.A. intermediate examination. The prizes were awarded to Mr. C. I. Greenhow, Newcastle, and Mr. W. A. Chamberlain, Tynemouth, whose work was much admired.

A large photographic group of members of the Association and a photograph of the late Mr. Thomas Oliver, the first hon. secretary and a former president of the Association, as well as one of the founders, had been received, and were in readiness for hanging in the rooms.

The meeting closed with the usual votes of thanks.

#### GLASGOW SCHOOL OF ART.

THE annual meeting of the Glasgow School of Art was held last week, Mr. Jas. Fleming presiding.

The annual report stated that the review of the past session was that of the first complete year of work under the official recognition of the Scotch Education Department. The school was now the central institution for higher art education for Glasgow and the West of Scotland. Periodical expert visitation was substituted for the Board of Education examinations, and a block grant supplanted all payments upon results. The governors were authorised by the Scotch Education Department to issue diplomas, and the holders would be entitled to the use of the letters G.S.A. The school was now divided into an upper and a lower school, and a responsible professor under the headmaster was placed at the head of each department. The governors had appointed M. Paul-Artot, who obtained his education in the Académie des Beaux-Arts in Brussels, under M. Portaels and M. Ch. Vanderstappen, as professor in the antique classes; and Mr. George Gregory, who came from the studio of Messrs. Brindley & Farmer, ecclesiastical sculptors, had been appointed master of ornament modelling. A class certificate examination took place in the architectural section, and the results were as follow:—Building construction—Senior, two passes out of five candidates; intermediate, six passes out of fifteen; preparatory, three passes out of fourteen; architectural design, three

passes out of seven; history of architecture, one pass out of two. In conjunction with the Scotch Education Department, the governors offered local bursaries amounting to 125*l*. Seven of these were of the value of 10*l*. each; ten of 5*l*. each, viz. three for life drawing and painting, one for figure composition, three for architecture, four for modelling and six for design. The conditions of the bursaries were that students must continue their studies at the school for another session, and visit the galleries and museums of art centres, such as London, Paris, &c. Ninety bursaries of the value of 120*l*. were offered for competition, as in former years, by the Haldane Trustees. In lieu of the free studentships hitherto granted by the Department to artisan students, twelve free studentships tenable in the day classes and thirty free studentships tenable in the evening classes were now being given by the governors. A new feature of the past year's work was the formation of Saturday classes for the instruction of school masters and mistresses. Sixteen students had received appointments as teachers, designers, &c. The total enrolments of students for the session were 998, being an increase of 160. The governors acknowledge grants from the Haldane Trustees, 200*l*; from the Corporation, 1,000*l*; from the Corporation towards building fund, 500*l*. A debit balance of about 1,000*l*. still stood against the building fund. The rearrangements in organisation and the alterations in management lately effected had all been for the permanent benefit and improvement of the school, and the governors were assured that the teaching staff and the equipment of the classrooms would make the Glasgow School of Art a centre where the most advanced art education could be obtained. The governors had endeavoured to meet the growing demands for advanced instruction in all branches of the fine arts, more particularly those bearing on the industries of the West of Scotland. They were conscious of many things that demanded more attention, but which they could not yet see their way fully to satisfy.

The Chairman said the new regulations under which the school was now conducted had been in force during the last year, but it was far too soon to pass a complete and thorough judgment on them. The governors were thoroughly satisfied so far with the experience they had gained, and all that had happened led them to believe that a great development of work would ultimately result from the new regulations. These laid a heavier burden on the governors, and to a much greater extent on the teaching staff. The teachers must now be alive that they were thrown upon their own resources, and unless they threw themselves heartily into their work the new regulations would not be a success. The staff had realised to a large extent their responsibilities, and if the results in the future continued to be equally good with those obtained last year the governors would be able to say that the change had been a most admirable one for all parties. He then referred to the strengthening of the staff, and remarked that if the governors had the money there were other developments which would still further raise the teaching power of the school and be for the benefit of the students. He alluded to the support received from the Haldane Trustees and the Corporation, and expressed his belief that if the students increased in number and more money was found absolutely necessary, it would be got from some source or other. Under the arrangement made with the Scotch Education Department the school received for five years a fixed sum of 1,000*l*., and it was probable that if the school improved the sum might be increased.

Sir Francis Powell said that the city of Glasgow depended greatly on art. Every article of commerce nowadays had some trace of art; unless it did so it was not marketable. Glasgow, therefore, ought to support art to enable the merchants to avail themselves of the best and most perfect art to produce decorations, and not to copy those trashy things that they saw titled "Printed in Germany." It was a strange thing that if goods were stamped by a town on the Continent—say, in France, Germany or Italy—they were supposed to be good art. It was very rarely so. There was at the present day, so far as he could see, as much good art in this country as anywhere. Glasgow ought to give every support to enable them to see what could be done in art, because it cost no more to print and embellish a thing in good taste than in bad taste. But to do that not only had the student to be educated, but also the people to see and know the difference between good and bad art. He considered the sum of 1,000*l*. given by the Corporation to be a paltry sum for a city like Glasgow. Sir Francis afterwards referred to the work done by the students as exhibited in the walls of the Institute.

Sir John N. Cuthbertson afterwards gave a short address. He remarked that with the school of art and the technical college the educational institutes of Glasgow were almost complete. He afterwards referred to the qualifications which were at one time demanded from the teachers under the School Board to teach drawing, and said he feared these qualifications could hardly now be reckoned sufficient. The Board were not now attempting so much in this direction as they did at one time, and he was sure the Board would endeavour to send all

their best drawing pupils to the school of art to get a better and a higher education. He further expressed his belief that if the governors found they required more money for the development of the school it would be obtained.

On the motion of Mr. McLean a vote of thanks was given to Sir John Cuthbertson for his address.

A vote of thanks was, on the motion of Professor Phillimore, passed to the staff, and the meeting separated.

#### BERMONDSEY ABBEY.

THE historical records and buildings committee of the London County Council report that during the recent excavations made in connection with the erection of working-class dwellings by the South-Eastern Railway Company on land belonging to the Council in Abbey Street, Bermondsey, some interesting discoveries were made of the remains of Bermondsey Abbey. The finds include some pieces of masonry consisting of Kentish rag, which would appear to have been the foundations and lower courses of the chancel of the old abbey church, and certain fragments of wrought stonework which may date from the reign of Henry III. (1216-1272), and some pieces, probably part of the transom or head of a glazed screen with two series of foliations, the dates of which may approximately be fixed between 1483 and 1530. In consequence of these discoveries further excavations were made, with the result that several additional pieces of stone were found, consisting of remains of jamb, arch and sill stones of what appear to have been parts of a large Perpendicular window and doorway, pieces of a hood-mould and arch of Early English character, part of a moulded plinth, and a piece of shaft. One or two of the stones show traces of polychromatic decoration. A plan has been made showing the position on the site of these discoveries and also drawings recording the mouldings on the wrought stones. A few bronze coins, a token dated 1665, and a broken crucible containing glass have also been found. The remains have been moved to the Horniman Museum. A monastery at Bermondsey was founded in 1082 by Alwin Childe, an eminent and wealthy citizen of London. It was at first an alien foundation, being dependent on the Cluniac Priory of "La Charité sur la Loire." The monastery, which rapidly grew in importance, was in 1399 erected into an abbey. At this time it had attained such dignity as to justify the appellation of the "Westminster of South London." In 1537 the abbey surrendered to Henry VIII, and the site was granted to the Master of the Rolls, Sir Robert Southwell. The latter immediately conveyed the estate to Sir Thomas Pope, who demolished the old conventual church and some of the adjacent monastery buildings, and with the materials built a house known as Bermondsey House. The house afterwards came into the hands of Thomas, Earl of Sussex, who on several occasions entertained Queen Elizabeth there. Long after the demolition of the house the gates and ruined walls of the abbey remained, and the north gate, which led into Bermondsey Square, was still standing in 1805. In Grange Walk there are still to be seen the last remains of the east gateway, the hooks on which the gates were hung still remaining *in situ*.

#### ROYAL SCOTTISH SOCIETY OF ARTS.

THE annual general meeting of the Royal Scottish Society of Arts was held in the Society's Hall, Edinburgh, on the 10th inst., when the president, Mr. F. Grant Ogilvie, delivered his opening address. He gave a *résumé* of the papers communicated last session, and pointed out how actively the Society was adapting itself to the changed conditions under which it now existed. The Society had consistently aimed at affording facilities for the consideration of means by which the natural productions of the country might be made more available, and at encouraging inventions, discoveries and improvements in the useful arts. Eighty years ago it was one of very few agencies available for these purposes. Now there were many such, but the widening of the field provided work and a place for all. Most important among the changed conditions was that of the standard of education. At the present time the methods of work in primary and secondary education in Scotland were in process of adjustment, approaching nearer and nearer to a most desirable ideal set forth with much clearness in official publications. The secondary schools, in that section of their work which was more directly related to the interests of their Society, provided a curriculum in which direct experimental familiarity with the principles of mechanics, physics and chemistry was combined with the study of mathematics, drawing and languages. In this way they aimed at turning out boys of sixteen not only with such a general mental training as would enable them in later years to take their place in the life and commerce of the country, but

also with minds and hands accustomed to question directly the machines and methods they use, and with a ready aid to their higher technical studies in a sound practical knowledge of elementary mathematics and drawing. One way and another the great army engaged in arts and industries would soon be drawing the majority of its young recruits from among those whose school training had done much to cultivate their aptitude for mechanical arts, and had afforded them just the foundation of knowledge of the facts and methods of science that they require for their future work. The number of those entering upon careers connected with arts and industries who had sufficient preliminary knowledge to take an intelligent interest in the discoveries and improvements of the age was now very great indeed. Formal classes of all kinds afforded such young men the instruction they needed in regard to principles, existing practice and methods of investigation. It was left for such societies as theirs to afford to their members opportunities of discussing the changes of to-day and the possibilities of to-morrow, to give a ready means of submitting an invention to friendly criticism and suggestion, and to bring together men interested in the same class of work. He did not speak of the Society as a means of obtaining publicity for an invention. In the past that was no doubt one of its most important functions, but in these days of technical journals and illustrated newspapers of all kinds a much wider public, or at least a more directly interested public, was reached through the press directly than by communications to a Society of Arts. But while that was so, yet to most of those who desired to bring forward inventions or improvements it was no slight advantage to be able to place these before a Society interested in such things, and probably numbering among its members not a few whose comments would be of much value. It was matter for congratulation that for the session now opening they had in view already a goodly supply of communications referring to inventions and improvements, as well as illustrated descriptive papers dealing with such subjects of immediate interest as wireless telegraphy, road-making in the Himalayas, the Nile dam and electricity in the coal mine.

#### EXPLORATION OF CAERWENT.

A LECTURE was delivered in Bath by Mr. A. Trice Martin on the excavations at Caerwent (Venta Silurum), Monmouthshire. He said he would be unable to tell them anything about the work carried on last summer, because they had not yet prepared their report, and if they had they would have had to submit it to the Society of Antiquaries, who had done so much to assist and support them. The generally accepted idea that Roman civilisation and institutions were swept clean away by the Saxons was not correct. In the first place, there were Roman cities remaining, in the case of some of which the continuity of their life was evident. Secondly, many of the so-called Anglo-Saxon institutions were really Roman under a thin disguise. Thirdly, modern research, in which connection he mentioned the names of Mr. Grant Allen and Dr. Beddoe, had shown that the Celtic population of Britain, instead of being driven out, remained among the Saxons, even in the eastern counties; and fourthly, the extraordinarily gradual invasion of the Saxons themselves, who took over one hundred years to reach the neighbourhood of Bath. He told them this to show a reason for conducting the explorations, for they were not curiosity finders, although of course they found relics; but there was another object, which was to obtain a fuller knowledge of the history of Rome itself, and for this purpose they should study not merely Rome itself, but her rule in her provinces as well. Villas or country houses had been dug out until he thought they had come to an end of them, for they were now of similar types; but of the cities they knew little. Silchester, in Hampshire, was the first to be excavated, and it had this advantage, that since the days of the Romans it had been abandoned but for a few huts, and the very outlines of the place could be traced by the way in which the crops grew. The next and only city was Caerwent, where there had clearly been a continuity of life, and where there was at present a village which considerably impeded the work, for, owing to the expenses that would be entailed by keeping open the ground after the investigations were completed, the places had in most cases to be buried again. The walls of Silchester were by no means symmetrical, while those of Caerwent were almost rectangular, the corners being rounded off, and, in his opinion, this pointed to the military origin of the town. The houses in Silchester were chiefly of two kinds: the courtyard type, with the rooms on three sides of the courtyard, and the corridor type, while in Caerwent they had found a unique type, a thing that helped the fund very much, for there the houses were built round all four sides of the open courtyard. Mr. Martin illustrated his

lecture with a number of slides. In some of the houses unearthed the explorers were confronted with difficulties from the extraneous masonry among the ruins, but these were solved after a time when it was found that at a later period in its history another house was built on the site, and in one case a factory had been added later again to the second building. This was particularly noticeable when the baths were found, for in the middle of a very handsome suite was found the factory furnace. Of the rooms in the houses, all of which were noted, the ones Mr. Martin directed special attention to were the winter rooms. In these, with the exception of a few rooms where they actually discovered open hearths where they burnt good old English coal from the Forest of Dean, the method of heating was by placing a tessellated floor supported by pylæ or little pillars on another floor, thus leaving a space into which were placed fires. The excavations round the north gate were specially interesting, for here they found the gateway had been partially blocked up by succeeding generations, while beneath were found the iron heads of pipes of varying diameter which showed that the Romans had an elaborate system of bringing water into the city. They had one disappointment, however, and that was that there were no inscriptions, except a useless portion of one found, but as they had explored only 3 acres out of 43 in the old city they could not expect more. After describing the other discoveries, including the mosaicwork and their schemes of decoration, Mr. Martin showed some pillars whose beauty had surprised them. He observed that in Bath they had greater and finer Roman remains; but they must remember Bath was a much richer place than Caerwent.

#### THE NATIONAL TRUST.

THE annual general meeting of the National Trust for Places of Historic Interest or Natural Beauty, which seeks to promote the permanent preservation, for the benefit of the nation, of lands and tenements of beauty or historic interest, and as regards lands, to preserve their natural aspect, features and animal and plant life, was held on Monday at the offices, 25 Victoria Street. Mr. J. C. Bailey, who presided, moved the adoption of the report, which stated that the movement for the purchase of the Brandlehow estate, on Derwent-water, was on a much larger scale than anything previously attempted by the Trust, and the Council felt that the success with which it met was to be interpreted as a verdict of approval of the work which the National Trust had undertaken and of the mode in which such work was carried out. Princess Louise, Duchess of Argyll, who performed the opening ceremony on October 16 last, was now president of the Trust. An acquisition made during the past year was that of the monument erected on the Dorset coast to the memory of Sir Thomas Hardy, Nelson's flag-captain. The tower had been handed over to the Trust on a 500 years lease, while Colonel Williams, M.P., had presented a maintenance fund to the Trust. The Council regretted the action of the owner of Stonehenge in surrounding the stones with a barbed-wire fence, because it believed that in doing so he had not only obstructed public rights of way, but had done grave injury to the monument in its relation to the surrounding country. The Council was strongly of opinion that the national interest in Stonehenge should be jealously guarded, and it considered that the most satisfactory solution of the problem would be for the monument to pass into the hands of a public body. Reference was also made to the action of the Council in connection with the view from Richmond Hill. The report was adopted, and the members of the Council were afterwards re-elected, with the addition of the names of Mr. Y. Anderson, Dr. G. Dawtrey Drewitt and Mr. O. Fleming.

#### TESSERÆ.

##### Colour Schemes.

THE error of considering the arrangement of colours only as a matter of taste is very prevalent. Mere matters of taste, however, are subjects upon which both nations and individuals differ widely, and there are no productions of this kind, however extravagant or absurd, that have not their admirers while they bear the gloss of novelty or stamp of fashion. Such matters are subject to no rule whatsoever; they are governed entirely by caprice, but it is very different with the arranging of colours, for that is regulated by laws founded on natural principles. There are, no doubt, many varieties of tastes in regard to colours, both individually and arranged. Many have fancies for and antipathies to particular hues. All have their tastes in regard to particular styles of colouring, some being fond of gay and lively, some the rich and powerful, and others the deep and grave. Some have a partiality for complex arrangements, while others prefer

extreme simplicity. But this is the case in music also: every variety and style of composition has its particular admirers; yet it never is assumed from this that the arranging of the notes in a melody or other musical composition is a mere matter of taste. All know that the arrangements of notes in such cases is regulated by fixed laws which cannot be deviated from without giving offence to the ear, and that a knowledge of these laws is absolutely requisite to everyone who wishes to cultivate that pleasing art. It does not matter under what circumstances a variety of colours is presented to the eye. If they be harmoniously arranged the effect will be agreeable to that organ as harmonious music to the ear; but, if not so arranged, the effect on the eye must be unpleasant, and the more cultivated the mind of the individual the more annoying will such discordance be.

#### Mexican and Egyptian Paintings.

Among the different representations on the walls of the Egyptian tombs and temples of the various nations on whom the Egyptians made war, there is represented a people distinguished by very striking characteristics. They are portrayed on the walls of Luxor as driven to their ships by Sesostri or Rameses the Great. Their deportment, their armour and their costume show that they were in a state of civilisation, at least equal to that of the Egyptians. They are eminently a maritime nation; they have been supposed to be Phœnicians, and it is difficult to suppose any contemporary maritime nation besides them capable of maintaining a war with the Great Sesostri, and who is, moreover, recorded to have made an irruption into their territories. Now how are these men, now almost identified with the Phœnicians by the logical necessity of the argument (for, in fact, there is no historical choice of any other nation)—how are they represented? They are beardless and red-skinned. Part of their costume identifies them with the American Indians, almost as much as their physical characteristics. They wear head-dresses like those worn by the Mexican nobles in the time of Cortes and the Peruvian magnates in the time of Pizarro. They consist of a diadem, surmounted by a circle of feathers or palm branches, slightly verging outwards. Anouki (the primitive Syrian Cybele) alone wears this head-dress among all the Egyptian gods and goddesses. In fact, on the walls of the flower-temple of Oaxaca and on those of Xochicalco appear individuals of a nation identifiable with the alleged Phœnicians of the Egyptian temples. They are red and beardless, they wear a similar tunic and the same head-dress, and they exhibit, moreover, the same elevated and classical physiognomy. Statues have been found approaching in facial outline and model the *beau idéal* of Greek statuary. They agree in physiognomy with the people sculptured at Oaxaca and Xochicalco; nor have they anything in common with the exaggerated features of the race of men depicted at Palenque. It may have been that the Mexicans were right in their tradition that their Tultecan predecessors came with the great ancestor of the American people, Votan, from the Ophite or Hivite land in Phœnicia. In fact, a Phœnician inscription has been found engraved on a rock in Massachusetts. Many curious traditions respecting this ancient emigration were preserved among the Mexican Indians, and are collected in different portions of various works which treat of the subject. The lights derivable from them are vague and scattered, but they may tend to impart additional probability to that which cannot be demonstrably proved. Such was the tradition that Votan and his companions, before the emigration, were present at the building of the great tower; that in the course of their emigration they visited or were expelled from Egypt—a tradition true only as applied to the great cyclopean or shepherd family of which they formed a branch. They may, however, have passed it. There is no other land but Egypt to which such traditional designations as the land of the dragon with seven heads, the land of the veils of papyrus, the land of the red lake or sea, could legitimately apply.

#### Effect of Picturesque Scenery.

It may be said that a passion for inanimate scenery, for heath and hill and long stretching down with the sea at its feet, may well engender some coolness and indifference towards a man's fellows, and that in acquiring a love for the stillness, the subtle responsiveness and the beauty of nature, one grows somewhat fastidious in the face of the turmoil and distraction, the uproar and seeming vulgarity, of ordinary human life. Contrasted with the steadfastness of nature here, the existence of the crowd wears a look of meanness, as of straws and dust blown hither and thither by horrid winds. After all, however, what is this but to say that, because you love Turner and Gainsborough, you shall detest your Hogarth? It is true that in Wordsworth one may detect some tendency of this kind. The absorption in which external nature held him engendered an air of coldness, if not quite of apathy, about the accidents of humanity. He certainly never cared as much about men as he did about mountains; never was as deeply stirred by thoughts of the one as of the other; did not find in

the former the stimulus to sympathy and expansion which he found in the latter. Wordsworth's nature, however, was exceptional in this respect, as it was in amount of genius. In the majority of men with any pretence to a fine moral temper there is an instinctive effusion of feeling for their own kind. The study and companionship of external beauty ought to strengthen rather than weaken this. The pitilessness of nature, displayed just as much in her beauty and calm as in her storm and fury, is the fact which, above all others, inspires pity and sense of fellowship, by convincing us that men are in the presence of forces which are absolutely indifferent to their sufferings and their endeavours. Perhaps no one furnishes so striking an example of this order of sentiment as Victor Hugo. Nobody is so sensible as he is of the ruthlessness of nature even while she smiles, and nobody is so alive as he is to the miseries of man and to the fact that our only resource is humane union and constant mutual helpfulness. He perhaps has dwelt more strongly than is altogether wholesome upon the impassive serenity of nature. This is not her only side. If she sometimes derides you by looking her loveliest when you are plunged in bitterness, let it be said also that by-and-by her steadfastness and permanence of relation begin to restore a serenity which is of the highest kind because it is the least narrowly egotistic. There are no doubt two sorts of men—one whom external nature in beauty or in horror most keenly touches, and the other whose sympathies are most directly reached and most generously stirred by the drama of busy human life. There are men who love their kind in the abstract but flee from them in the concrete. There are others to whom nature is cold and unsuggestive and inhospitable. You have Wordsworth, and you have Dr. Johnson or Charles Lamb, who loves the tide of life that flows at Charing Cross. Perhaps it goes without saying that the best and happiest man is he who unites in himself a particle of either temperament—who is content or glad to be alone with the external world, and is not too fastidious nor too loftily cloudy to enjoy the life and spectacle of the crowd.

#### The Barrage of the Nile.

Frequent reference is made in discussing Egyptian affairs to the barrage of the Nile. It is claimed that Napoleon I., when in Egypt, suggested the construction of such a work, but the honour of attempting to realise it is due to Mehemet Ali, who instructed one of his engineers, M. Mougel, to commence operations in the year 1846. The barrage crosses the Nile about twelve miles below Cairo, where the river divides into two branches, terminating in the Rosetta and Damietta mouths respectively. From end to end, the total length of the structure is  $1\frac{1}{4}$  mile. At the time of commencing the works the depth of water at high Nile ranged from 5 feet to 80 feet; so the first operation was to excavate the shallow portions and to fill in the deep bed with a huge mound of rubble. Upon the site thus prepared a broad and thick mass of concrete was deposited as a foundation for the barrage proper. In Oriental fashion, Mehemet Ali having once made up his mind to carry out the work, wished to see it realised at once. He insisted upon the mass of concrete above referred to being completed during the low Nile of 1847, which involved the mixing and depositing of no less than 4,000 tons of concrete per day. On the barrage itself and the three canals in connection with it an army of 80,000 men withdrawn from the villages was employed. The unfortunate fellahs were crowded so thickly on the work that control or supervision was impossible. As an inevitable result the mass of concrete upon which the efficiency of the barrage depends is in places merely a dislocated mass of sand and stone, without any cementing medium. Upon this rotten foundation an ornamental and massive structure of brick and stone was erected, and still remains a standing monument of the folly of its projector, who ruined an admirably conceived scheme by the childish impetuosity with which he attempted to realise it. To form an idea of what the superstructure of the barrage is like, it is only necessary to imagine two long railway viaducts, with a fort between them. The barrage across the Rosetta branch is 1,525 feet in length between the abutments, and includes sixty-one arches of 16-feet 4-inches span and two locks. That across the Rosetta branch is of similar construction and 1,787 feet long. The mass of concrete forming the foundation is 112 feet wide and 12 feet thick; the width of the roadway over the arches of the barrage is 30 feet, and the height of the same above low Nile level is 39 feet. Large iron sluices are fitted in the arched openings of the barrage, by closing which it was hoped to dam back the river and raise its level 15 feet on the up-stream side. Owing to the defects already referred to, it has been found impossible to effect this; and indeed, when it was attempted a part of the structure cracked seriously and began to move down-stream. Between the two barrages the Menoufieh Canal, having a bottom width of 200 feet, or about three times that of the Suez Canal, leads off to irrigate the lands between the two branches, and similar canals have their headworks on the flanks of the barrage.

### Individuality in Art.

Not only do no two artists see nature the same, however highly trained their eye may be, but the unconscious preferences of a nature's whole condition dictates in each individual case the treatment, accentuating one side or the other of nature's complete truth. There is no such thing as positively provable *rightness* after the teachable qualities in art are once satisfied. The whole nature, not only the eye, is the tablet on which the facts of "sight" are reflected; and if spiritual and intellectual powers are prominent elements in the artist's nature, as well as emotional sympathy towards form and colour, the artist's gift reflects such elements as part of nature's truth, affecting its aspect as necessarily as does the sunlight or the moonlight. The motive power of the art emanating from such natures springs from a richer well, including human powers of a higher order than those of mere sense and emotion. The core of the truth of nature is revealed to the poet-painter, not merely the truth of her aspect. This is unquestionably obvious, but does not answer the whole question. Not only is there in really great painted poetry a power in the purely artistic gifts rightly to translate in the language of art emotional, spiritual and intellectual truths, but there is genius in the touch which makes such art not only a right rendering of such elements in nature, but a happy rendering. There is to be found in it an inspiration in the handicraft as well as in the mind. The greatest delight of the artist's craft is to see the poetic preference of his own nature carried out by a happy touch which adds something to nature and makes her his very own. Such a gift is almost unconsciously possessed, proceeding rather from the general condition of the artist's nature and the habitual tone of his sensibilities and character than from any conscious effort. The value of this individuality which stamps all work, noticeable for any power whatsoever from the earliest student studies, is to be gauged by the character of the unconscious no less than the conscious preference of the artist. The greater his powers as a poet, the subtler, the more elevated, the more extended will be his sympathies with nature; and if he be a born artist as well as a poet, that sense of the inner as well as the outer aspect of nature's truth will inspire his touch as a painter or a sculptor, and complete his work with the beauty which belongs to art as art, and not to art as a copy of nature only.

### Russian Architecture.

When from Novgorod the seat of the empire was, by Ivan, transferred to Moscow, that city received at the hands of its prince a new cathedral, which has since again been demolished: he also constructed a citadel, called Kremlin, and a lesser church, in remembrance of the Transfiguration, which still subsists. Of these, as of all the other churches erected in Russia while the Grecian empire lasted, the architects were Greeks. When the fall of Constantinople caused Italians or natives to be employed, the original style of the country continued so far to influence their designs as still to make these present the Greek exterior in the façade, adorned with enamelled tiles; and the Greek distribution in the cross, with four equal ends, crowned by a large central and four smaller surrounding cupolas, of bulbous form, from between which shot orth steeples, shaped like the minarets of Cairo, of Ispahan and of Delhi: and as the cathedral of every Russian city resembles the Mohammedan mosque, so the Gostinoy Dvor—the square market-place—of every city, with its double range of arcades, resembles every eastern caravanserai or khan, and marks, like the former, the relationship borne by the Russian architecture to the Arab, the Persian and the Moorish, and its common filiation with these from that of Constantinople, whose ramifications, extending alike to the north of Europe and the south of Asia, the Indian and the Atlantic Ocean, enable one, in the market-place of Novgorod, to fancy oneself in the Meidoun of Ispahan; in the cathedral of Kieff, to acknowledge relationship with the mosque of Cairo; and in the Kremlin of Moscow to recognise the minarets of Agra and of Delhi.

### Art and Nature.

Art is essentially the imitress of nature; it is the right reason of the thing done, and every art, and that of building amongst others, is defined by Aristotle to be the habit of producing with judgment, and agreeably to the rules of reason, what is good for man. The efficient cause being in the maker, not in the material, it should be directed not merely to attain its purpose, but to attain a good purpose; it is the judgment by which one object is selected out of many similar objects; it must strive to combine the beautiful with the useful, and as there are many forms of government—but there is one which is the best fitted to the genius of man, which is the best—so also in architecture there are many styles, but one only which is universally acknowledged to be the best. Such were the opinions of the wisest philosophers amongst the Greeks, of those who lived and taught amidst the temples and stoas of Athens, and who knew that they guided the feelings of an

enlightened people. As virtue is the perfection of reason, so is art the perfection of nature; it is nature elevated and improved, and as wisdom is not the creatress of man, but has received him in a state of embryo from nature to improve him by faithfully following up the principles which she has engrafted, so does the artist in the progress of his work keep his eye constantly fixed on that archetype and brings it to perfection under her guidance.

### GENERAL.

**Mr. Edward F. Brewtnall**, one of the members of the Society of Painters in Water-Colours, died on the 13th inst in his fifty-sixth year. He was mainly known as a figure draughtsman, many of his drawings having imaginative subjects.

**Sir John Aird, M.P.**, accompanied by Sir Laurence Alma-Tadema and Mr. E. Boulnois, M.P., left Charing Cross on Tuesday for Egypt, to attend the opening of the Assouan Dam.

**Mr. Allen Stoneham**, of Surbiton, has presented a marble statue of Queen Victoria for erection at Perth, Western Australia.

**Mr. Jesse Clare**, of Sleaford, has been elected as county architect by the Kesteven County Council. The other selected competitors were Mr. Cuthbert Harding, of Lincoln, and Mr. J. A. Mettham, of Grantham.

**The Stonehenge Committee**, in order to meet the dangers of the winter, have recommended the immediate application of wooden props to the stones about which the chief anxiety is felt.

**Mr. H. M'Clure Anderson**, architect, Edinburgh, has obtained an appointment as architect for the Foreign Mission Board of the United Free Church of Scotland in Manchuria, China. Mr. Anderson received his early training in the office of Mr. Hamilton-Paterson, architect, George Street, Edinburgh, and has been for the last four years chief architectural draughtsman for Messrs. Hamilton-Paterson & Rhind, architects, Edinburgh.

**The Metropolitan Asylums Board** have approved a scheme prepared by Messrs. T. W. Aldwinckle & Son for the remodelling of the administrative block, the erection of new staff quarters, receiving-rooms and isolation wards and four storey pavilions at the South-Eastern Hospital, at an estimated cost of 76,000*l.*, and have directed that the plans be forwarded to the Local Government Board for their formal sanction under seal.

**Mr. W. S. Walker**, architect, Bridlington, has been returned as town councillor for Quay Ward, Bridlington, unopposed.

**The Pulpit** for the new Roman Catholic Cathedral at Westminster has been completed by Signor Aristide Leonori, Rome. It is the gift of Mr. Ernest Kennedy, and is constructed of a variety of costly marbles.

**A Public Conference** is to be held in the London Guildhall on Friday, the 28th inst, at 3 P.M., on the operation of the Land Transfer Act in the City since it came into operation on July 1 last, and the desirability of an independent inquiry being held into the working of the Act generally.

**Lord Cranborne** has informed Sir Alfred Hickman that an order was given for 27 viaducts for the Uganda Railway in December 1900 to an American firm which had offered to construct and deliver them in forty-six weeks. The contract provided that actual erection was to be completed within seven months from the date on which the chief engineer should report that he was ready for the contractors to begin work. This he did on December 20, 1901, and the viaducts should therefore have been completed by July 19, 1902. Thirteen of these viaducts have already been taken over from the contractors. Penalties to prevent delay were provided in the contract in the usual manner, but no decision can be come to in regard to enforcing them until the works are finished, and the circumstances under which the delay occurred fully considered.

**The Private View** of the Exhibition of the Royal Society of Painters in Water-Colours will be held on the 29th inst. The exhibition will be open to the public on the following Monday.

**The Collection** of antiquities in the Guildhall Museum has been increased by the addition of some ancient relics unearthed in the course of recent excavations in Tabernacle Row. They comprise a number of articles for domestic use, and are all in an excellent state of preservation, including some portions of cloth garments considerably over 300 years old. These antiquities are attracting considerable attention from those in the habit of visiting the museum. Several volumes of records of city parishes have been also obtained.

THE

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**ASHTON-IN-MAKERFIELD.**—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

**BRIDGWATER.**—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgwater.

**BURTON WOOD.**—Plans and estimates are invited for proposed new church and church hall. Mr. W. Southern, Rose Villa, Collins Green, Newtown-le-Willows.

**CAPE TOWN.**—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will

be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

**DURBAN (NATAL).**—Dec. 18.—Designs are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

**ECCLES.**—Dec. 12.—Plans are invited for the laying-out of an area of land and for erection of dwellings for the working-class on part of such area. Premiums of 50*l.*, 30*l.* and 15*l.* will be awarded in respect of the plans placed first, second and third in order of merit. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

**HOLYHEAD.**—Dec. 2.—Sketch designs are invited for schools and a teacher's house. The competitor whose designs and terms are approved and accepted by the Board will be appointed the architect. Mr. R. E. Pritchard, clerk, Holyhead.

**HULL.**—Jan. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

**ILKESTON.**—Nov. 28.—Competitive plans for a mixed junior school to be erected in Bennerley Street are invited. Particulars may be obtained from Mr. Wright Lissett, Town Hall, Ilkeston.

**KINGSTON-ON-THAMES.**—Jan. 15.—Plans and designs are invited for a central home and cottage homes for children of both sexes in the Kingston Road, in the parish of New Malden. A premium for the first three selected plans of 25*l.*, 15*l.* and 10*l.* respectively is offered. Mr. Jas. Edgell, clerk, Union Offices, Coombe Lane, Kingston-on-Thames.

**SCOTLAND.**—Nov. 29.—The Arbroath Golf Club invite competitive plans for a new golf club-house at Elliot. Mr. William Alexander, secretary, 62 High Street, Arbroath.

**WORKINGTON.**—Competitive designs are invited for a new public library to be erected in Finkle Street. Premiums of 25*l.*, 15*l.* and 10*l.* are offered. Mr. W. L. Eaglesfield, borough surveyor, Town Hall, Workington.

## CONTRACTS OPEN.

**AMSTERDAM.**—Dec. 3.—For supply of—Contract No. 319—Corrugated and flat galvanised iron (soft steel) with appurtenances. Contract No. 70.—Asphalted cast-iron pipes with appurtenances. Contract No. 71.—Corrugated galvanised iron with appurtenances. Contract No. C8.—Galvanised iron (soft steel). Contract No. D8.—Corrugated and flat galvanised iron plating and roofing. Contract No. E8.—Zincd iron wire. Contract No. F8.—Soft steel. Contract No. H8.—Sundry plates, discs, &c. Contract No. 18.—Light rails and chairs with bolts and sleepers. Particulars may be obtained from the firm of Mart. Nyhoff at The Hague.

**AUSTRALIA.**—Dec. 22.—For erection at Perth, Australia, of a rubbish destructor capable of dealing with forty tons of garbage in eight hours. Mr. W. E. Bold, town clerk, Town Hall, Perth.

**BEAUMARIS.**—Nov. 26.—For repairs to the hospital ship. Mr. W. Hughes, clerk, 34 Castle Street, Beaumaris.

**BEXLEY HEATH.**—Dec. 8.—For erection of car-shed buildings. Mr. T. G. Baynes, clerk, Urban District Council, Public Hall, Bexley Heath, Kent.

**BISHOP AUCKLAND.**—Nov. 25.—For erection of Primitive Methodist minister's house at Coundon, near Bishop Auckland. Mr. J. Walton Taylor, architect, Newcastle-upon-Tyne.

## FOREST GATE PUBLIC HALL.

THE new public hall which was opened at Forest Gate on the 1st inst. will add very materially to the amenities of that rapidly growing district. Erected from designs by Mr. Acoc, architect, of Wormwood Street, E.C., the new building is of a thoroughly practical and up-to-date character. A small proportion only of the cost, which amounts in the aggregate to some 7,000*l.*, has been expended on ornament, but nevertheless the architect, aided by the excellent workmanship of the contractors, Messrs. John Barker & Sons, Ltd., of High Street, Kensington, and the capital materials employed, has succeeded in putting up a very pleasing and commodious structure. The simple but effective elevation is in red brick, and the accommodation provided comprises a large and lofty main hall, capable of seating 1,000 people. This is provided with a completely fitted stage at one end and a gallery at the other; the hall is effectively decorated in shades of green, it has parquet flooring, is electrically lighted, and warmed by means of radiators. There is an equally well-proportioned smaller hall, which would, perhaps, accommodate 300 persons, and several conveniently arranged club and retiring-rooms. In the light, dry and roomy basement are situated kitchens, heating chamber, stores and bicycle stables, &c., and some adjoining land is being laid out as a garden, with tennis courts, &c.

## TENDERS.

# WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

**PRICE**

5/- per foot super.

Wilson's Patent  
"SAFETY" Pavement  
Lights prevent slipping

Wilson's "DIOPTRIC"  
Pavement Lights are  
an improvement on  
the semi-prism at the  
same price.

**EWART'S GEYSERS.**

At this time of the year attention turns to the question of the hot water service, which, while sufficient in the summer months, is often inadequate in the cold weather.

A ready manner to increase the existing arrangements without considerable expense is to install one of Ewart's geysers. The "Lightning" geyser provides hot water instantly required (whether night or day) without any waiting, and as the water is heated while passing through the machine the supply is unlimited.

An important departure from the ordinary geyser is the "Califont." This machine is constructed to supply hot water instantly to any part of the house, and as it is made to withstand the pressure of the cold water main, it can be placed in the basement or in any out of the way position. The "Califont" will be found very economical in use, as the gas is only full on while hot water is being withdrawn from any of the draw-off taps, and as soon as the tap is closed the gas is lowered to a small by-pass.

A great advantage with the "Califont" is that it may be connected to existing hot-water pipes already in the house. Another new apparatus is the "Euston" radiator, which is

particularly suitable for warming halls, offices, rooms, passages, &c. It requires connection only to small gas supply, occupies little space, requires no attention and gives excellent results.

Messrs. Ewart & Son, Ltd., have issued recently a new and complete catalogue of smoke-curing appliances. Special

attention is drawn to the "Empress" smoke cure, which has been found very successful in curing smoky chimneys in the most difficult positions.

An inquiry addressed to Messrs. Ewart & Son, Ltd., 346-350 Euston Road, will receive prompt attention, and catalogues of their different specialties will be forwarded post free on application.

MR. M. K. NORTH, inspector of the Local Government Board, held an inquiry on Tuesday at the Widnes town hall into the application of the Town Council to borrow 1,200l. for the reconstruction of the central outfall sewer. The town clerk (Mr. H. S. Oppenheim) explained that the application arose out of a report of the borough surveyor in April last. The report stated that several of the pipes were broken, and that the majority of the joints were open, some as much as 3 inches. The surveyor was called, and said it was proposed to reconstruct the defective portion of the sewer on a timber pile and concrete foundation.

**TRADE NOTES.**

MESSRS. ANDREW HANDYSIDE & CO., LTD., of Derby, have secured the contract for the iron roof over the new vegetable market at Lancaster.

MESSRS. WM. POTTS & SONS, clock manufacturers, Guildford Street, Leeds, have erected a new hour-striking clock in the tower of Holy Trinity Church, Boar Lane, Leeds, for the vicar, churchwardens and trustees.

THE Wellington hospital, New Zealand, is being warmed and ventilated by means of Shorlands' double-fronted patent Manchester stoves, grates, exhaust roof-ventilators and inlet tubes, by Messrs. E. H. Shorland and Brother, of Manchester.

MESSRS. HODKIN & JONES, LTD., Havelock Bridge Works, Sheffield, are supplying their "H. & J." patent plaster partitions to the premises now being erected in Sheffield for the York City and County Bank (Messrs. Demine & Brierley, York, architects), they having been adopted for use throughout the building.

THE COLUMBIAN FIREPROOFING CO., LTD., 37 King William Street, have completed their contract for fireproof floors and roof at the large building for the Bon Marché, Brixton, Mr. J. B. Chapman, architect, and their estimate has just been accepted for the L. C. & M. Bank, Richmond, for the fireproof floors. This makes the twenty-second bank in which their construction has been adopted for this Corporation.

**BUILDING AND BUILDERS.**

THE memorial-stones of a new Baptist church situated on the Pear Tree Road, Derby, have been laid.

THE foundation-stones of a new Unitarian church in Lytham Road, South Shore, Blackpool, were laid on Saturday.

THE foundation-stone of a new portion of St. Giles's Church, Normanton, near Derby, was laid on Saturday. The estimated cost of the enlargement is 3,500*l*.

THE new Grimsby dock scheme is to be at once proceeded with and Parliamentary powers are to be asked for during this session. It is proposed to construct a light railway from Grimsby to the dock, which is to be about 44 acres in area.

THE corner-stone of a mission church for Huddersfield, in the Primrose Hill district, was laid on Saturday. The church

will accommodate 360 people. It will be built of broken coursed stone, and the cost, including the making of a street, is put down at 3,250*l*.

MEMORIAL-STONES have been laid of a new church and school in connection with the Methodist New Connexion Church, Fairfield Road, Openshaw. The site of the new building is within a few yards from the main road leading from Manchester to Ashton-under-Lyne, and when completed it will have cost about 3,000*l*.

ON the 15th inst. the foundation-stone of a church for the Free Church of the Welsh was laid on a site in Claughton Road, Birkenhead. The building, which is from the plans of Mr. T. T. Rees, will when completed improve considerably the appearance of that portion of the road in which it is being erected. Its total cost, including the site, will be about 3,000*l*. There will be accommodation for between 500 and 600 persons, and there will also be three classrooms and two vestries. The contractor for the work is Mr. W. R. Holland.

AT the meeting of the house committee of the Chesterfield Board of Guardians the clerk reported that he had received an order from the Local Government Board authorising the Guardians to proceed with the erection of the temporary infirmary, and that the Court of Quarter Sessions had confirmed the order of the justices respecting the diversion of the footpath from Marsden Street to Spencer Street. Mr. W. C. Jackson, architect, wrote stating that he was getting out bills of quantities in connection with the work, and asked for an additional commission of 2½ per cent, but the committee resolved that the 5 per cent. fixed when Mr. Jackson was engaged was reasonable and sufficient.

**ELECTRIC NOTE.**

A LENGTHENED discussion took place at last week's meeting of the Kilmarnock Town Council regarding electric lighting and traction. The Council having acquired powers for lighting, the electric committee recommended that an application should now be made for powers under the Tramways Act, so that the two schemes might be put into operation concurrently. Mr. Wilson moved the adoption of the report, which was seconded by Mr. Matthew Robertson. Mr. Burnet moved as an amendment that the matter be delayed for further consideration, and Bailie Turnbull seconded. The amendment was adopted by twelve votes to eight.

## VARIETIES.

THE Glasgow Corporation sewerage committee have agreed to borrow 600,000*l.* to carry out their sewage purification scheme, on the estimate for which there was a deficiency of 800,000*l.*

THE extensions to the Peebles Burgh and County High School, consisting of hall, art-room, combined workshop and cookery-room, janitor's house, &c., and built at a cost of 3,400*l.*, were formally opened on Saturday afternoon.

THE associate section of the Edinburgh Architectural Association held their annual dinner in Ferguson & Forrester's, 129 Princes Street, on the 13th inst. Mr. A. Percy presided over a party numbering over fifty. After the usual toasts had been pledged an excellent musical programme was submitted.

THE Local Government committee recommend that Mr. Sidney Webb should represent the London County Council on the committee appointed by the recent conference of municipal and other rating authorities to prepare a scheme for the rating of site values.

A PUBLIC elementary school has been opened in connection with St. Cuthbert's Church, Trafford Park, the incumbent of which is the Rev. Benjamin Davies. The premises consist of the mission church, the chancel being screened off, and accommodation is provided for 150 boys and girls.

MR. J. W. PLEWS, surveyor and sanitary inspector of the Wigmore (Herefordshire) Rural District Council, and formerly surveyor in the Pickering and Sherburn districts of Yorkshire, has been appointed to a like office by the Ripon Rural District Council.

AT Morecambe on Monday the new Central Board schools, which are finely equipped and have cost about 20,000*l.*, were opened by the chairman of the School Board, Dr. J. W. Watterson. The style is a combination of Gothic and Renaissance, and the exterior is entirely in stone. There are departments for art instruction, manual classes and other branches not immediately classed as technical. The schools give accommodation for about 1,100 children.

IN connection with the northern approach to the Tower Bridge, the First Commissioner of Works has notified that he is willing to arrange for a triangular plot of land in front of the main entrance to the Royal Mint to be given up to the public way, free of cost to the Council, instead of being, as now, reserved by the Government. This proposal will have the

effect of increasing the width of the thoroughfare at this part beyond the 80 feet already settled as the width of the remaining portion.

CHURCH halls in connection with St. Columba's Presbyterian Church of England, Smithdown Gate, Liverpool, were opened on the 13th inst. They have been built at a cost of 1,685*l.*, of which amount 1,150*l.* has still to be liquidated. The architects were Messrs. Woolfall & Eccles of Castle Street, and they have put up a building that will meet all the requirements of the church for some time to come. It contains in addition to a large hall a guild-room, several vestries, and a small meeting-room.

GENERAL SIR ARCHIBALD HUNTER, commanding the forces in Scotland, opened on Friday last new headquarters and drill halls which have been erected in Main Street, Bridgeton, in connection with the 3rd (Blythswood) Volunteer Battalion Highland Light Infantry. The building, which is of Dumfriesshire red stone, and is in the Late Gothic style of architecture, includes a front building with men's retiring-room, billiard-room, lecture-hall, &c.; a mid-building, 100 feet by 80 feet, to be used as a drill hall, and the old back building, in which provision is made for a Morris tube range.

AT a meeting of the Lancashire and Cheshire Antiquarian Society held in Chetham's Hospital, Mr. R. Falkner gave some particulars of St. Mary's Church, formerly in the Parsonage. He described the tower and the east window, and said the face of the foundation-plate was inscribed—"This spire was built by the voluntary subscriptions of ye inhabitants of Manchester in ye year 1762. The first stone was laid by Edward Byrom, Esq., borough-reave. The Rev. Mr. Downes, rector; I. Lightoler, architect;" whilst the reverse was engraved, "John Jackson, mason." With the approval of the Dean of Manchester and the rector and wardens of St. Ann's, the plate will, it was said, be fixed in the baptistery in the interior of the tower of that church—the ecclesiastical parish of St. Mary's having been united with that of St. Ann's in 1890.

LORD BALFOUR of Burleigh, Secretary for Scotland, visited on Monday the county buildings, Ayr, and had an interview with the parties interested in the buildings in reference to the proposals under consideration for the appropriation of a portion of the buildings for County Council purposes and of a portion for the judicial business of the county. A plan for the alteration of the buildings, prepared by Mr. Allan Stevenson, Ayr, on behalf of the County Council, and an alternative plan prepared

by the Board of Works were before his lordship. There were present Mr. R. A. Oswald of Auchencruive, convener of the county; Mr. Marcus Bain, vice-convenor; Mr. W. H. Dunlop of Doonside, convener of the Council's law committee; Sir William Arrol of Seafeld, M.P. for South Ayrshire; Sheriff-Substitute Shairp, Ayr; Mr. John Lockhart, solicitor, Ayr, as representing the Ayr Faculty of Solicitors; Mr. Andrew Crawford, Sheriff-Clerk-Depute, Ayr; and Mr. James E. Shaw, county clerk. There is a difference between the parties as to the accommodation to be allotted in the buildings to county and judicial business respectively. Lord Balfour did not express any opinion, and in view of questions raised as to the legal position parties were requested to submit written statements.

### UNDERGROUND BAKEHOUSES.

MANY of the bakers of Liverpool are at present in a state of consternation. Under a clause of the Factory and Workshop Act, which came into operation last January, no bakehouse which is more than 3 feet below the surface of the footway of the adjoining street or ground can continue after January 1, 1904, to be used for the purposes of a bakehouse, unless it shall be certified by the health committee to be suitable for such purposes. In the last report of the medical officer of health for Liverpool (Dr. E. W. Hope) it was shown that on December 31, 1900, there were 1,040 bakehouses on the register which is now kept by the Health Department of Liverpool.

In a note on the provision of the new clause of the Act which Dr. Hope has addressed to the health committee, it is stated that a very large proportion of the bakehouses in the city will be affected by the Act, "practically the whole of those in the older parts of the city, and probably upwards of 25 per cent of those in the suburbs." Many of these bakehouses, it is further said in the note, "are in an insanitary condition, and should be closed altogether. A considerable number, however, perhaps admit of such structural alterations as would enable the required certificate to be given." Dr. Hope's note was accompanied by a list of "suggested requirements for underground bakehouses," the first of the suggestions being "the

bakehouse to be in every part thereof at least 8 feet 6 inches high, measured from the floor to the ceiling, and to have at least 3 feet of its height above the surface of the adjoining street, or of the ground adjoining or nearest to the bakehouse, unless provided with a suitable area or areas into which a window or windows of such underground bakehouses open."

As many of the bakehouses are wholly below the level of streets, it is impossible, says the *Courier*, for them to be brought strictly into accord with the requirements of the Act and of the medical officer's suggestion as given. Copies of Dr. Hope's note to the health committee, with his own suggestions, were forwarded to officials of the Liverpool Flour and Bread Trade Association a few days ago, that an opinion might be expressed upon them. The matter has been considered at two meetings of the committee of the Association, and at a meeting of bakers at the south end of the city, and it has been decided that a deputation representing the trade shall wait upon Dr. Hope and lay before him the views of the trade upon his own suggestions. If a strict adherence to his suggestion be insisted on, the position of many bakers will be extremely embarrassing. In very few cases is there space available to construct new bakehouses on the ground level, and it is not at present seen how bakers will overcome the difficulty of finding fresh bakehouses.

On the bakers' part it is contended that many of the underground bakehouses are as sanitary and well kept as bakehouses on the ground level; that they are more comfortable than ground-floor bakehouses as being "cool in summer and warm in winter," and that in other respects they are more convenient for working than ground-floor bakehouses. It is also contended that, in view of the facts of the bakehouses forming an old existing institution, and of there being no room in the vicinity of most existing bakehouses to build bakehouses on the ground level, every consideration should be shown to bakers by the authorities. It is pointed out that when, some years ago, many of the shippens in connection with dairies in Liverpool were condemned, the late Councillor John Houlding made an inspection of many of them, and suggested that ventilation and improvements should be tried instead of their being summarily closed. This course was adopted, and most of the shippens which had been scheduled as condemned were allowed to remain. Bakers contend that the same policy of ventilation and improvement should be adopted in reference to their bakehouses. At present, however, a state of general unrest and apprehension prevails

Excelsior and Rawdon Potteries,

among the many bakers of Liverpool who have underground bakehouses, and the coming interview of the deputation from the local trade association with the medical officer is being awaited with much concern.

### THE AUCTIONEERS' INSTITUTE.

THE second meeting of the session was held on Wednesday evening, when Mr. D. Michael Faraday read a paper upon the rating of machinery, the president, Mr. John Hepper, in the chair. The subject is engaging the attention of surveyors to a great degree, since a Bill is now before Parliament on the question of exemption of machinery from taxation. The matter is surrounded by such complexity of views that it was thought a discussion upon the question of "How machinery is to be taken into consideration if it enhances the value of hereditaments in which it is *in situ*," might solve many knotty points. The assessment authorities urge that this can only be ascertained by finding the actual value of the machinery. The speaker thought that half the difficulty herein would be overcome if the valuer remembered that the whole of the assessment law is based on a hypothetical assumption. What would a tenant give as rent for a hereditament for the purpose for which it is now used? Reference was made to the judgment delivered in the Tyne boiler case by Lord Esher, who laid down the following rule:—"I believe the rule really to be that things which are on the premises to be rated and which are there for the purpose of making and which make the premises fit as premises for the particular purpose for which they are used, are to be taken into account in ascertaining the rateable value of such premises, that when things are brought into this category they would pass by a demise of the premises as such as between landlord and tenant." The company were asked to decide:—"Is the machinery which one finds on any particular hereditament intended to remain permanently there, and is it for the purpose of making the premises fit as premises for the particular purpose for which they are used?" The speaker argued that all machinery in any factory makes that factory what it is, and therefore the only conclusion that one can come to is that all machinery must be taken into consideration where such machinery is

found in use in a factory, and it has to be treated for rating purposes as passing by a demise from the landlord to the tenant. He illustrated how impossible it would be to say how much buildings were enhanced by the presence of machinery if a valuation of the machinery were not made.

Mr. Marshall, K.C., Mr. Herbert Fuller, Mr. James Boyton and others contributed to the discussion.

A cordial vote of thanks was passed to Mr. Faraday for his paper, as well as to Mr. Hepper for presiding.

### NEW STREET STATION, BIRMINGHAM.

IF there is anything more than another which impresses the visitor immediately on his arrival at New Street railway station, says the *Birmingham Daily Post*, it is the colossal and imposing character of the building itself. He cannot fail to be struck, too, by the many arrangements necessary for the proper management of the station—arrangements which work like clockwork, notwithstanding the bustle and animation usually seen there. His attention will be arrested also by the uniform cleanliness of New Street, having regard, of course, to the enormous amount of traffic which is constantly taking place within its walls. Each day the passengers there number well over 50,000, while thrice that number pass over the handsome bridge which cuts through the station, for it has become one of the most populous highways of the city. Yet how many of these have any idea of the vast amount of work that is necessary to keep the huge station in anything like a clean and respectable condition. Quite a series of staffs of men are constantly engaged, in one capacity or other, solely in this work of cleaning and renovating. The necessity of it will be readily understood when one makes even a superficial estimate of the dimensions of the structure and important operations within. Few persons, indeed, even of those who belong to Birmingham, have any true idea of the magnitude of the station. Its area alone is something like 14 acres, and its platforms, if they could be placed in a line, would stretch well-nigh to Moseley. It is calculated that on an average a train either arrives or departs every two minutes. In other words, 700 trains are received into the station in the ordinary working day, and it is computed on the lowest possible basis that their living freights in one year would total the enormous figure of 15½ millions. It

should be clearly pointed out, however, that these figures only represent a normal condition of things, and that on Bank holidays and other special occasions the amount of traffic is very materially increased. Indeed, there are days when the trains running in and out of the station will number quite four figures.

Time was when New Street railway station occupied the unique distinction of possessing the largest iron and glass one-span roof in the world. It has always been an object of admiration, and although it has during comparatively recent years been surpassed in point of size by the span at St. Pancras, it will ever remain a worthy example of what may be accomplished in the way of roof building. This span, which covers what is known as the old portion of the station, Nos. 1, 2 and 3 platforms, in the entire use of the North-Western Company, has a width of 212 feet, and the highest point from the permanent way is 83 feet. It stretches the entire distance of the station, 360 yards or thereabouts, from north to south, with the exception of course of the lower or Paxton roof at the north end, which continues to the end of the platform to a point near Navigation Street. The span of St. Pancras station, it may be mentioned, is 31 feet wider than that of New Street, and the roof of Lime Street, Liverpool, is also broader, being something near 410 feet, but this is, however, achieved in a couple of spans. The Birmingham roof is supported by a couple of spans. It has been stated that the covered space at Liverpool Street, London, forms the largest enclosed railway station in England, but the roof is not, however, in one span. The Birmingham roof is supported by thirty-six massive iron principals, with innumerable tie bars, which cross and recross in bewildering fashion. The principals on the Stephenson Street side of the station are supported on brick pillars, which form part of the wall of the station buildings and the Queen's Hotel. On the south street side the roof is supported by cast-iron collars, and on the top of these the principals rest on an arrangement of rollers to allow for contraction and expansion due to variations of temperature.

The cleanliness of the roof is, of course, a most important matter. Upon it the light and brightness of the station largely depend, and this brings one to the subject of the work of cleaning and renovation. In this task a gang of workmen are always engaged, for it is of far greater magnitude than would at first sight appear. There are altogether thirty-five bays in the roof, each of which has a width of twenty-four feet, and, assuming that painting was continually carried on by a staff,

say, of twenty men, it would occupy about eight months to accomplish the work, or, roughly speaking, a week for every bay. Having regard to the volumes of smoke constantly emitted from the engines, one would naturally imagine that the glass would be considerably darkened inside. But, as a matter of fact, the result is just the opposite. The sooty deposit accumulating on the outside is very considerable, and it is a common sight to see a strong contingent of men, with ladders, busily working with hard, broomlike brushes. It is quite out of the question to attempt to remove this deposit with water, but by the use of a special chemical preparation the work is easily accomplished, and the huge glass panes are restored to something like their pristine brightness and purity. The cleaning of the inside of the glass is, comparatively speaking, a trifling matter.

For interior renovation, however, the most careful arrangements have to be made for the safety of passengers and workmen, and experts only are employed in the construction of the scaffolding. A platform necessary to do the work required on a single bay will demand, for instance, the use of over 14 tons of scaffolding, and then below this are hung, as an additional precaution, twenty-six huge sheets of black sailcloth canvas. These protection sheets not only serve to the workmen the same function as the netting which is placed beneath the flying trapeze of the circus, but they prevent any tools which may fall from the scaffolding dropping on the platform or permanent way. Altogether there are eight acres of roof, and of this over six are of glass. The "extension roof," or, to make it better understood, that part which covers the Midland platform, is in six spans, the two largest of which have a width of 68 feet, and it is carried by no fewer than 269 wrought-iron principals and girders.

But this roofwork, vast as it undoubtedly is, forms but a part of the duties which receive the cognisance of the painter and renovator. Buildings there are by the score to be maintained—offices, waiting and refreshment rooms and workshops, as well as some eleven bridges, four at the north end, which carry Navigation and Hill Streets, and seven at the south or Worcester Street side. As all these bridges are of iron, it is scarcely necessary to point out the important part which paint must play if the structures are to be kept in good order and free from corrosion. The painting area is nearly three times the acreage of the station. It extends over something like 38½ acres, and to get access to this work 25 tons of scaffolding are always kept at the station. By competent authorities it is

calculated that if a gang of twenty men started work at the commencement of one year, and worked continuously, it would take them three years to cover the whole surface, and then the area which first received attention would again require treatment. In fact, to give New Street station anything like a respectable appearance the application is necessary of no fewer than 122,000 lbs. of paint, or, to put it in a more simple way, sufficient paint would be needed to fill a small swimming bath. The huge army of station porters are responsible for the cleanliness of the foot-bridge and platforms, and in the early hours, when this work is usually done, they may be seen working with a rest with sweeping brushes of abnormal size. But, with all this co-operation, it is obviously a task of some duration to properly clean a mile and a half of platforms, for such is the distance if their length is totalled up. There is yet another staff of cleaners, but their work is wholly concentrated on the carriage department. By the travelling public, however, their services are perhaps more appreciated than those employed in the capacities already mentioned, for their work comes directly under notice. Yet each, of course, discharges a most necessary work, which, on sanitary grounds alone, is viewed with the utmost satisfaction not only by the travelling public, but by the citizens generally.

### INSTITUTION OF ELECTRICAL ENGINEERS.

THE opening meeting of the new session of this Institution was held on the 13th inst. in the rooms of the Institution of Civil Engineers, Great George Street, Westminster, when there was a full attendance of members. In the absence of the president, Mr. J. Swinburne, owing to illness, the chair was taken by Mr. Gavey, engineer to the Post Office, who mentioned that after considerable deliberation the Council had determined to postpone the reading of the President's inaugural address until such a time as Mr. Swinburne might be able to attend. Formal business was then transacted, and it was announced that Professor Ayrton had, from ill-health and pressure of other business, resigned the honorary treasurership of the Institution, and that Mr. Robert Hammond had consented to fill his place. The Chairman said that the Council had had under consideration the continuance of the useful and pleasant visits of the members of the Institution to foreign countries, and had arranged the preliminaries for a visit to Italy in the spring of next year. He also mentioned that the Institution had received

a cordial invitation from the American Institute of Electrical Engineers to visit the United States and hold a joint meeting there or in Canada. The communication suggested that such a meeting might be arranged for Montreal next year, or at some spot in the eastern part of the United States in 1904, to include a subsequent visit to the St. Louis Exhibition, where an electrical congress would be held. The Council had considered this invitation, and had decided that as they could not arrange a meeting for next year, owing to the projected visit to Italy, they would accept the invitation for 1904, suggesting at the same time that the joint meeting might be held in Canada, when they would hope to receive the co-operation of the McGill University. The Council had also been in correspondence with the Home Office with regard to the Factory Act, and it had been assured that full opportunity would be afforded for the discussion of the new regulations before they were adopted. The Council had publicly expressed the hope that the Secretary of State might see his way to do what he could for the profession in regard to the employment of young persons in electricity works. The President of the Institute had been elected *ex officio* to serve on the committee appointed by the Home Office to inquire into questions relating to the use of electricity in mines. A suggestion for the levelling-up of the subscriptions to the ordinary maximum would shortly be laid before the members. Before the proceedings closed the chairman presented the premiums awarded for papers read and published during the session of 1901-2.

### BARNSELY MEMORIAL CHURCH.

ON Friday last the Bishop of Wakefield (Dr. Eden) consecrated the church of St. Edward the Confessor, which has been erected at Kingstone Place, Barnsley, by Mr. E. G. Lancaster, of Keresforth Hall, in memory of his father, the late Mr. Edward Lancaster. Mr. Lancaster has also built a vicarage and endowed the living.

The church forms a prominent landmark in the highest portion of the town. It is built in quiet Early English style. The nave is 70 feet long and the total breadth 46 feet, and the chancel is 40 feet long by 20 feet wide. Granite columns separate the aisles from the nave. The floor is in mosaic, the seating of pitch pine, and the choir seats, capable of accommodating thirty-five choristers, of oak. The total accommodation

is for 400 worshippers. The pulpit is a fine structure of beautifully veined polished alabaster. The upper part is octagonal in shape, each face having tracery panels with carved emblems of the four Evangelists. It is supported on serpentine marble columns with carved capitals, and the steps are of white marble. The font is similar in design and structure, each of the eight faces having moulded panels and richly-carved emblems.

The reredos, which is of an ornate character, is designed in harmony with the church, and is composed of richly variegated polished English alabaster and marbles from Connemara and Castellino used in the sculpturework, enriched by columns of green marble flanking the canopies and backgrounds of gold mosaic. A carved cornice terminates in a pure white marble cross with carved floriated terminations.

At the west end of the church is a screen of pitch pine. The lectern is of brass, representing the eagle with open wings on massive pedestal.

The vicarage, the work of Mr. J. S. Packer, Southport, situated close by, is in keeping with the design of the church. All the elevations are faced with Yorkshire stone, and the roof is covered with green Westmoreland slates and red ridge tiles.

The fabric was erected to designs by Mr. J. S. Packer, Southport, under whose supervision it has been erected.

#### EDINBURGH STUDENTS' ENGINEERING SOCIETY.

PRINCIPAL LAURIE, of the Heriot-Watt College, lectured to the members of the Edinburgh Students' Engineering Society. The meeting, which was held on the 13th inst. in the Heriot-Watt College buildings, was largely attended, and Mr. Horne occupied the chair. Principal Laurie gave an account of his recent visit to the engineering and technical schools of America and Canada. In particular, he described the engineering departments of the Columbia University at New York, the Harvard University at Boston, the Armour Institution at Chicago, the Cornell University and the McGill College in Canada. He noted the extensive scale on which engineering is taught in these institutions, and the thorough and complete character of their equipment. The explanation of the sumptuous character of technical education in the States was to be found in the enormous liberality of America's rich men. The demand for trained and scientific engineers in America was

greater than the supply, and young men, after they had taken their degree, often had the choice of two or three appointments. The course of engineering training extended over four years, during which period practical work in the workshop was taken very seriously. In some of the larger engineering works, when a young engineer was engaged, although he had his degree, he was asked to put in two years in the workshop. While the owners of large works did not accept any but trained and scientific engineers for employment, they also had numerous apprentices, but the latter were only intended to be used as mechanics and foremen. In connection with American engineering schools, the following points, among others, were to be noted:—A high mathematical standard was insisted on at entrance to the university, the authorities did not attach great importance to examinations, and everything was done to encourage students to make original research. Principal Laurie was cordially thanked for his lecture.

#### MINORS AND BUILDING SOCIETIES.

THE appeal of the Nottingham Permanent Benefit Building Society *v.* Mrs. Thurstan has been decided in the House of Lords. The respondent was a member of the Society, and while a minor got advances on land and buildings at West Bridgford. In 1898 the respondent executed a mortgage with the appellants to secure the repayment of 1,200*l.* by monthly instalments of 10*l.* 4*s.* The respondent said that until she was sued for the 500*l.* by her stepmother she was not aware of her disabilities as an infant. After the appellants discovered she was an infant they expended certain moneys in completing the houses without, she said, any request or authority from her. An offer was made by her solicitors to the Building Society to come to a settlement on a fair and reasonable basis, but this was refused. She then raised an action against the appellants asking for a declaration that the mortgage was void, and that she was entitled to have it cancelled. Mr. Justice Joyce dismissed the action. On appeal (the respondent not disputing the claim of the appellants to a lien for so much as was paid by them to the vendors for purchase money and expenses) the Court declared that the mortgage deed was void as against the respondent, and directed the appellants to deliver it up to be cancelled. The respondent had since paid off the amount due to the appellants. The appellants

contended that the Building Societies Act, 1874, had given minors a general power to borrow and to execute securities, and to enter into obligations for the repayment of money borrowed. Mr. Justice Joyce considered that it was unnecessary to decide the point that an infant could enter into a mortgage to a building society and be bound by the provisions of the mortgage deed, and all the Lords Justices were of opinion that an infant member of a building society could not execute a valid mortgage to secure repayment of advances by the society.

Mr. Hughes, who argued the case for the appellants, contended that upon a true construction of the Building Societies Act and the rules of the appellant society the respondent was competent, notwithstanding infancy, to give a valid mortgage. The respondent could not affirm the purchase and repudiate the advance. They formed one transaction.

At the conclusion of the appellants' argument, and without calling upon counsel for the respondent, the Lord Chancellor moved that the appeal be dismissed with costs. Their lordships concurred and judgment was given accordingly.

### BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual meeting of this Association was held at the Grand Hotel on November 13, under the chairmanship of Mr. Albert S. Smith. The annual report remarked upon the depressed condition of the building trade during the past year, and stated that the new rules as to operatives had been amicably arranged and appeared to be working satisfactorily. On several occasions during the year deputations from the Association had waited on members of the Corporation and obtained modifications and alterations in the Corporation by-laws and the Omnibus Bill, which were considered essential in the interests of the trade. The balance-sheet showed a sum of £1714. 12s. 4d. to the credit of the Association.

In moving the adoption of the report and balance-sheet, the President said it was a matter for regret that the falling-off in trade had continued during the past year, while it was a matter for greater regret that prices ruling to-day were in comparison worse than the state of the trade; it was many years since competition was so keen as it was to-day. Otherwise the report was of a most satisfactory character.

A dinner followed the meeting, and was largely attended.

Mr. A. S. Smith occupied the chair, supported by the Lord Mayor (Councillor Hallowell Rogers) and Alderman Bowen. Others present were Messrs. W. Sapcote, A. Rowse, G. Kenwick, R. Bulley, C. H. Barnsley, Alderman Bigwood, Councillor Whittall (who was in the vice-chair), T. Cooper, J. J. Moffat, J. B. Whitehouse, A. Harrison, J. Patchett, A. E. Tallis and others.

Alderman Bowen submitted in fitting terms the toast, "The City and Trade of Birmingham." There was, he said, promise in the younger ranks of the City Council which held forth hopes that in the not distant future the city would become entitled to its old title, "the best-governed city."

The Lord Mayor, in responding to the toast, stated that it frequently happened that that banquet was the first public function of the new chief magistrate. It was right that he should attend, humorously added his lordship, in order that he might build a good and solid foundation for his year's work. He approved of the objects of such associations as theirs, pointing out that if the workmen went into union it was right that the masters should do the same, so that there might not be advantage on one side or the other. He had no doubt that, as representative bodies, they were better able to discuss and deal with matters than they would be if there were no organisations. Touching on municipal matters, particularly in relation to the building trade, his lordship stated that what had often struck him had been the great difference in the price of tenders on comparatively small undertakings. There was sometimes a difference of thousands of pounds. He supposed it was one of those freaks of nature which could not be accounted for. The builders as a body were kept closely in touch with several of the departments of the Corporation, and it was a matter for congratulation that the relations between the two had always been of a cordial and friendly character. He hoped that those friendly feelings would be maintained. Alluding to the Corporation Bill, which had just received the approval of the ratepayers, he paid a compliment to Councillor Whittall for the valuable help he had given in framing the building clauses. Councillor Hallowell Rogers, having referred to several other matters engaging the attention of the Corporation, then made feeling reference to the deaths of two of her prominent and most useful citizens—Alderman Hart and Mr. Sam. Timmins. Alderman Hart, he said, died in harness, as a Christian citizen should. Mr. Samuel Timmins was one of a small band of earnest workers of which George Dawson, Charles Vince, John Henry Chamberlain and John Thackray Bunce formed a group, and

who endeavoured to raise the social and political life of the city at a time when it was a very low ebb. They laid the foundations on which Mr. Joseph Chamberlain built the new municipal city life of which we were to-day reaping the benefit. Mr. Timmins rendered invaluable work on the free libraries committee. If he had died a quarter of a century ago his death would have been regarded as a great public calamity, for he was then one of Birmingham's most prominent citizens.

The toast "Success to the Birmingham Builders' Association" was proposed by Mr. A. Harrison (president of the Birmingham Architectural Association).

Mr. John J. Moffat gave the toast of "The Architects and Surveyors," and Mr. T. Cooper and Mr. A. Rowse responded.

The toast of the "National Federation of Building Trade Employers" was given by Mr. C. H. Barnsley, and Mr. Sapcote (the president of that body) replied, pointing to the work which it had accomplished.

The concluding toast was that of "The Visitors."

### THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, November 11, Mr. John Clarke Hawkshaw, M.A., president, in the chair, the paper read was "Electric Tramways," by C. Hopkinson, M.Inst.C.E., B. Hopkinson and E. Talbot, M.Inst.C.E.

The authors stated that when, about the year 1897, electric tramways had begun to be constructed in Great Britain on a large scale, there had already been many thousand miles in operation in America, and a vast amount of American experience had been available in connection with this branch of engineering. Consequently British tramways had been constructed largely according to American methods, and showed a good deal of the uniformity characteristic of American practice. The authors' experience had been gained principally in the construction of the tramway systems of Leeds and Newcastle-on-Tyne, and the paper discussed a number of important points in tramway practice, which were illustrated by reference to these two systems of tramways. The paper was divided into four sections, viz:—

1. Generation of power. 2. Transmission of power to the cars. 3. Rolling stock. 4. Earth returns.

The nature of the load on a tramway generating station was discussed, and it was shown from actual records to what extent

increasing the number of cars resulted in making the load more uniform. With seventy cars or more, the load was so nearly constant that the steam consumption per unit was substantially the same as though it were constant and equal to the mean. Hence in a station of this size equalisation of the load by means of a storage battery was of no use as regarded economy, though in a small station it might be of great value. A storage battery equal to replacing one-third of the generating plant for half an hour should, however, be installed in a continuous-current power station for the purpose of replacing a generating unit in case of breakdown, and for running cars at night. The effect of short circuits on the generator was considered; in the worst case there might be a force equal to three or more times the normal force applied at the periphery of the armature for a period of one-tenth of a second, that being the time which a circuit-breaker took to open. This necessitated a very strong connection between armature and flywheel. Another effect of the opening of the circuit-breaker was the sudden diminution of the load on the engine to nothing, which necessitated special arrangements for preventing the engine from running away. This required either very quick governing or a heavy flywheel. Except for short circuits, an ordinary governor and an ordinary flywheel were sufficient. Tachograph records showing the rise of speed on one of the Newcastle engines when the load was thrown off were discussed. The question of over-compounding dynamos was considered, and dynamos wound for constant potential were recommended.

The simplest method of transmitting the power to the cars was to make the trolley-wire into an electrically continuous network, and to feed the current into it at various points. In practice, however, it was found necessary to divide the trolley-line into sections insulated from each other, each section being fed at one point. The points of division in the centre of a city were determined by considerations of safety; in the outer districts questions of economy and the necessity of keeping the variations of line-potential within limits might come in. The principles were illustrated by reference to Newcastle-on-Tyne. There was no objection to the line-potential occasionally dropping 100 volts below normal, and this led to the result that a 2½-minute service of cars could be worked up to a distance of two miles from a feeding-point. The most economical size of cable was next considered; the mean current density should rarely exceed 300 amperes to the square inch. This entailed a mean drop of potential of about 13 volts per mile of feeder, and feeders could

be carried to a distance of 1 mile or  $1\frac{1}{2}$  mile without boosting. The loss in the trolley-wire in supplying ten cars on 1 mile of double track from one end was between 2 per cent. and 4 per cent. of the power given to the cars. The conclusion was that on the outer sections the line might be divided into sections 2 miles long. In many cases excessive traffic on a particular route had to be dealt with on a few days of the year, the traffic being small on other days. This was illustrated by reference to a case in Leeds where fifty cars had to be supplied with current on twenty days in the year at an average distance of  $3\frac{1}{2}$  miles from the generating station. The method by which this was done with continuous current and boosters was discussed, and was compared with and found preferable to three-phase high-tension transmission and conversion. The Leeds tramway system was as extensive a system as could be economically served by a single continuous-current generating station placed in the centre of the system.

The most important requirements in a motor car for use in city tramway systems were that it should be capable of rapid and well-sustained acceleration, and that it should be able to go quickly up hill. These requirements could be fulfilled only by motors capable of travelling on the level of speeds far above what was allowable in practice. Curves were given showing the acceleration of the car from rest with various motors and under various conditions. A mean acceleration of 3 feet per second up to a speed of 10 feet per second could be obtained with motors of a type found to be satisfactory in Leeds and Newcastle. The effect of bad driving on starting was considered.

There was much difference of opinion on the subject of earth returns. In Great Britain the Board of Trade restriction of the rail-drop to 7 volts had made cases of electrolysis by return currents very rare, but it could not yet be said that absolute safety was secured for metallic pipes in the neighbourhood of tramway-tracks. The resistance of the rails and bonds used in tramway practice as determined in experiments by the authors was given. In a new fished and bonded joint a good deal of current went through the fish-plates and sole-plates. The Falk cast-welded joint was described and also the thermit-welded joint. It was unadvisable to use such joints on sharp curves or on crossing a bridge with steep approaches on account of the effect of expansion and contraction. On straight track, however, the lateral support to the rails prevented variations of temperature from doing damage. Experiments were described from which it appeared that from one-sixth to one-fourth of the

current in the rails was diverted into the earth. A service of about ten cars per double mile could be worked over a distance of two miles, the feeding-point being at one end, without the 7-volt limit being exceeded. The system of return feeders in Newcastle and Leeds was described. Where the Board of Trade limit was exceeded, if all the current were taken out of the rails close to the power station, the extension of the return feeder to points about half a mile distant from the power station would produce a very marked reduction in the rail-drop, owing to the fact that the great concentration of current which took place in the centre of the city with converging routes was thereby avoided. This was the system now adopted in Newcastle-on-Tyne, but provision had been made on the switchboard whereby the cars could be divided into two groups, each group being run by its own generator. The first comprised all the cars outside a radius of three miles, and a second all within that radius. In Leeds the greater part of the current would be taken out of the rails close to the power station, but a portion sufficient to bring the drop of potential in the rails within the legal limit would be sucked back through a number of return feeders about one mile long. Exceptional traffics at particular points were dealt with by special boosters and return feeders. The authors' experiments showed that a current of 300 amperes in the rails between two points, two miles apart, implied a potential of about 5 volts between those two points. The potential was proportional to the current within 1 per cent., which showed that the conduction of the leakage current through the earth was metallic in its nature and not electrolytic to any considerable extent. Examination of the current in the rails and of the potential at various points of the tramway system with a constant current of 300 amperes passing had shown that only a very small portion of the current got into the gas-pipes. This result was discussed and was shown to be not surprising. The possibility of electrolysis with such currents as did get into the pipes was considered. Unless there were strata of such small extent and high conductivity compared with the average and so placed as to cause a concentration of the current into the pipe to a density of a thousand times the mean current density or more, no corrosion of the pipe would take place and the 7-volt limit might be exceeded many times without damage to the pipe. On the other hand, if such strata were present, electrolysis (with damage to the pipe) was quite possible, even though the 7-volt limit was not exceeded.

# ARMOURED FIRE DOORS

Telephone,  
No. 143 Westminster.

Telegrams,  
"Sprinkler, London."

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

Can be made to Close Automatically in Case of Fire.

Will NOT Buckle or Twist out of Shape.

## STEAM HEATING INSTALLATIONS, HIGH AND LOW PRESSURE. VACUUM SYSTEM.

Water Softening and Purification.

Feed Water Filters.

GRINNELL AUTOMATIC FIRE EXTINGUISHING INSTALLATIONS.

**MATHER & PLATT, LTD.** (into which is merged DOWSON, TAYLOR & CO.),  
Park Works, Manchester; and 14 Victoria Street, London, S.W.

# The Architect.

## THE WEEK.

THE Glasgow Corporation are evidently in competition with the London County Council as to which body will display the most colossal discrepancies between estimates and outlay, and it is by no means certain that with the metropolitan body will rest the victory. In 1896 borrowing power was obtained to raise 600,000*l.* for carrying out a sewage scheme. The works were estimated to cost 450,000*l.*, and purchase of lands, wayleaves and other expenditure were put down at 150,000*l.* The amount already expended amounts to 526,000*l.* People who believe in northern methods will jump to the conclusion that the works have been completed for that sum, or say 70,000*l.* below the estimate. Unfortunately for the reputation of Glasgow, the works cannot be considered as more than half executed, for a further outlay of no less than 563,000*l.* will be required. It will therefore be necessary to have recourse to borrowing a second sum of 600,000*l.*, and as affairs are conducted it is impossible to say whether that sum will be adequate for the realisation of the scheme. The latest proposal is to borrow a million. Of course various causes are forthcoming to explain the discrepancy. One is that owing to the inordinate claims made by contractors on other works it was necessary, "in preparing the specification for the sewers and works, to insert such precautionary clauses as would prevent this practice being successfully attempted in the large undertaking which the Corporation had in hand, and to devise, in a form more drastic than usual, provisions to insure the best quality of workmanship and materials. These precautions, which were urgently needed, resulted in the preparation of a specification with terms whose rigidity became the subject of complaint on the part of the contractors. The vigilance of supervision necessary to insure the proper execution of the work gave further cause for discontent, although the experience of engineers in Glasgow, Edinburgh, Manchester and elsewhere abundantly proved the necessity of employing every possible means of scrutiny and superintendence." If contractors have to execute works which were not originally specified, it is only equitable that they should be paid for them as extras, or under another name if preferred. The plain meaning of the precautions was that no extras would be recognised, and contractors were not to blame if they endeavoured to secure themselves from losses and over-estimated the probable extras as contingencies.

ALTHOUGH not publicly announced, there is little doubt about the desire of the Local Government Board to have modified by-laws adopted by the Dartford Rural District Council which would allow of the erection of caretakers and labourers' dwellings of an economical class. It is not easy to use compulsory means, but if the Council will seek authority for passing such a cottage as Mr. E. D. TILL has erected, and for which he was fined, a modification of the by-laws will be sanctioned. At present the subject is under consideration. What has to be insured is that in case of fire there will be no structures sufficiently near to become a menace. With agriculture in its present condition it is not to be expected that substantial cottages of a type adapted for towns can be erected in country districts, although the need for shelters is urgent.

ARTISTS as a rule are not like RUBENS in mastership of diplomatic tactics, and it is as well they make no pretensions to that kind of skill. A case has occurred in Glasgow which came very near failure because of disposition to employ language as if it were intended for the concealment of thought. At a late meeting of the Glasgow Corporation report was submitted which recorded that representatives of the Royal Glasgow Institute of the Fine Arts, viz. MESSRS. MICHAEL SIMONS, P. H. DUNN, J. L. MACFARLANE, J. BURNET and JOHN HENDERSON, with Mr. PERCY TATE, the secretary, were heard on the subject of the communication received from the Institute, "expressing their desire to offer to the Corporation practical sympathy in view of their possible action in extending the scope of

their artistic enterprise, when, after a lengthened interchange of views, it was agreed that a small sub-committee of the parks committee and a small sub-committee of the Institute should be appointed to confer and further consider the matter." So mysterious an announcement was too much for Scottish caution, and there was a general inquiry about the meaning of the transaction. All the representatives of the Corporation could offer in explanation was that information on the subject could not be given. One member's solution was that the members of the Institute wished to obtain control of something which they did not possess at present. The Deputy Town Clerk said the members of the deputation could not tell definitely what they wanted. Eventually, it was arranged that the sub-committee, when appointed, will endeavour to ascertain what is sought in so unusual a manner. We suppose the Glasgow Institute of Fine Arts consider there is a probability that the Corporation will expend money on pictures and statues which are not masterpieces, and they wish to act as guardians of the ratepayers. But if that was the intention, why was it not frankly announced?

THE art masters under the Board of Education are in a precarious position, for outside the official limits there is no demand for their services. When they are found remonstrating or unfolding grievances it may be concluded they have reason for their action. The deputation from the Society of Art Masters that waited on Lord LONDONDERRY a few days ago is a sign that the new organisation of the Board of Education is far from being as efficient as the outside world has imagined. The complaints related to the insufficient qualifications of inspectors in art schools, and the absence of art masters and experts from the Advisory Council for Art Purchases. The want of co-ordination of study in elementary schools and institutions giving advanced art instruction was also mentioned. Lord LONDONDERRY could only say that the Board of Education had at its disposal the services of occasional inspectors whose qualifications had been regarded as of the most valuable kind. Their services would be utilised in the future, and steps were being taken to extend the operations of the art inspectors to other schools in addition to schools of art. The importance of co-ordination was admitted, but for the present it was necessarily mainly a matter for local arrangement. His lordship promised that the request for representation on the Teachers' Registration Council and the Council of Advice for Art should be submitted to the consultative committee now considering the regulations governing the matter. Lord LONDONDERRY's reply is more generous than those usually given. The masters have revealed defects which should be remedied. Whether the official spirit will facilitate improvements has yet to be seen.

THE project of another line of railway between London and Bristol revives the battle of the gauges. BRUNEL was nothing if not original, and he could not accept the gauge which had been adopted by the STEPHENSONS, LOCKE and other pioneers. But he always found men to support his most grandiose projects. The broad gauge was very costly, for there had to be more land purchased, the bridges were of larger span, the rails were heavier and the rolling stock more capacious; but, on the other hand, it was more satisfactory to travel on the Great Western than on any of the lines running northwards. One effect was that the Great Western was compelled to be isolated, for there could be no running powers over other lines. It was necessary, therefore, to convert the broad gauge system into correspondence with the narrow gauge. What is now proposed is to seek for powers to construct a line which will serve a similar purpose with the Great-Western Railway. Bristol, Bath and Basingstoke will be points, and running powers will be sought over the South Western through Woking and to the Waterloo terminus. The only novelties will be the new termini in London and Bristol. It is claimed that the proposed line will diminish the distance between London and Bristol, and there will be more direct communication with the South-Western system. If constructed, the proposed line is likely to increase the importance of Bristol.

PAINTERS' ARCHITECTURE: ALBANO.

### MACHINERY AS FIXTURES.

IN the course of the articles relating to the case in which certain tapestries were claimed to be fixtures, although they were not directly attached to walls, we endeavoured to point out the modern tendency of the Courts with regard to fixtures in general. It is not always feasible nor perhaps is it at any time judicious to endeavour to reduce so important a subject to the brevity of a formula, but architects and surveyors cannot be expected to go through a long course of reasoning when they are required to give a decision on a short notice. It is generally sufficient for their purpose to realise the extent to which anything described as a fixture can be considered as attached to the land, which in England appears to be not only the most esteemed class of property, but the very base of the Constitution itself. Electricity is popularly supposed to be an invisible power which, regardless of the injuries it may inflict on the way, is always seeking a refuge in the earth, and fixtures likewise are not to be considered as they appear in the form of wainscoting, conservatories, trees, but as things which as much belong to the earth as does the lightning, which seems to rush from the heavens to it as a home and protection.

By using the ground as a support it is supposed that the law of fixtures gains not only consistency and security, but simplicity also. A house becomes, as it were, a part of the earth, therefore any action which injures walls, roof or foundations, affects the earth, and as such is penal. If tapestries or other decorations are closely united to walls, the removal causes risk; therefore if such things were not intended to remain permanently as part of the building, they should have been set up in such a way as would make their portability (in a legal sense) manifest to all. In other words there should be nothing to suggest direct or indirect legal conductivity between them and the land.

It is comparatively easy to determine what objects correspond with those which were in use when the difference between fixtures and removable possessions was first made the subject of discussion. Doors, windows, outbuildings, massive dressoirs, hearthstones, chimneypieces, &c., have been long in use, and although put in by a tenant, were in old days rarely removed. It is not going too far to assume now they were never intended to be removed. But a great variety of aids and appliances have in course of time become necessary in houses. Some of them are more advantageous when fixed, and on that account a real, or more often a tacit, permission is given by which their removal is allowed, and they become only nominally fixtures. If it were anticipated that objections would be raised it would be possible in the majority of those cases to make arrangements by which even an indirect attachment to the freehold would be avoided. A bookcase or a pier-glass need not be nailed to a wall, and invention could easily devise security for other pieces of furniture or decoration while in position.

There are, however, classes of things employed in buildings, if not always in houses, which were unknown to our ancestors, but which are now indispensable. They may be comprised in one class as means to supplant or supplement human labour, or, in other words, as machines.

Fixity is essential to the majority of them. That quality can sometimes be imparted by the mere weight of material employed in the machine or apparatus. If the machine vibrates a base of cast-iron will sometimes be sufficient to make it steady. But from the time of the introduction of machinery by tenants it was seen that a landlord's interests were not served by the imposition of regulations which would hamper the tenant's trade. Under the name of trade fixtures a great many things were held to be removable which, if the letter of the law were imposed, would have to remain. If we take the list prepared by CHITTY over half a century ago we find among trade fixtures steam and other engines; machinery, "if let into caps or steps of timber;" buildings, if used in connection with an utensil that was removable; cranes, furnaces, pumps, &c. In case removal led to deterioration of the property, it was no doubt optional with the freeholder to adhere to his full rights. As far as can be judged there was, however, a spirit of equity everywhere by which a tenant was not deprived of the assistance which he had set up and which enabled him to live.

In modern days the use of machinery has become more general. It would be no exaggeration to say that in the industrial conflict which England is waging against the greater part of the civilised world, machines are as important as cannon in military struggles. Without the aid of machinery, or with less effective machines than our competitors, it will be impossible to sustain our position as producers. As a consequence, it is now possible to have the temporary use of machines, and the modern "hire and purchase system" has been adopted for them in common with furniture, musical instruments, books, &c. The question arises, How is the law of fixtures affected by arrangements which are intended to increase the productive power of the country? There was no fear of foreign rivals when it was laid down that whatever is attached to the soil directly or indirectly belongs to the soil, and why should a fear arise now, or, if it must exist, why should it not succumb to the ancient privilege by which land is held to be superior to all the products of all the machines which can be collected in any one place? In a few words, that represents the discussion in which the ablest judges and lawyers have been recently engaged. The circumstances are remarkable, and, it may be added, characteristic of Great Britain alone.

A man who held a lease for ninety-nine years of some land at Reading erected a factory on it. He mortgaged the premises with the fixtures. The mortgage was assigned to the defendants, Messrs. WILLIAM ASHBY & SON, LTD. Before the assignment, Messrs. F. W. REYNOLDS & CO., the plaintiffs, let on hire to the lessee woodworking machinery which was to be paid for in instalments, but until all the conditions were fulfilled the machinery was to remain the sole and absolute property of plaintiffs. Everyone knows that machines for planing, moulding, tenoning and such operations are useless if there is the least vibration. Accordingly a bed of concrete was laid down beneath each machine, to which it was bolted. There was nothing extraordinary in the arrangement, for we sup-

pose there is not a woodworking machine in the country which is fixed for work in any other way. Although the effectiveness of the machines was thus insured, the course adopted was sufficient by English law to transform the ownership of the property, to take it from the manufacturer and to vest it in a firm who had not paid for its possession. Such is the power of a few bolts, although they are removable through having a part tapped and nuts screwed on them. The conditions not being complied with, the plaintiffs demanded the return of their property, but the possessor refused. An action was taken, but the case was so simple the judge declined to allow the question of ownership to be left to a jury. The decision in *HOESON v. GORRINGE* was that similar articles were fixtures, and judgment was accordingly entered for the defendants.

The case came a few days ago before the Court of Appeal in the form of an application for a new trial. The Master of the Rolls, Lord Justice ROMER and Lord Justice MATHEW were the judges. Counsel for plaintiffs could not boldly face the facts. He could only argue about the absence of evidence that the machines were part of the freehold, and that the mortgage was entered into prior to their arrival. There was no getting over the circumstance of the beds of concrete, the iron plates with holes and the bolts with nuts. If the machines depended on their own weight English law might concede they were not fixtures, for as Mr. Justice BLACKBURN laid down:—"Perhaps the true rule is that articles not otherwise attached to the land than by their own weight are not to be considered as part of the land, unless the circumstances are such as to show that it was intended all along to continue a chattel, the onus lying on those who contend that it is a chattel." A gas stove, however large, is removable; a gas engine becomes a fixture. It is true Mr. Justice BLACKBURN did not anticipate the hire and purchase system, but if he did his rule would be unaltered. The Master of the Rolls said it was clear law that, as between landlord and tenant or between tenant for life and remainderman, trade or tenants' fixtures, which were attached to the freehold in such a way as to become part of the freehold were included in a mortgage of the land and could not be removed as against the mortgagee. There is consequently an extraordinary risk in disposing of machines without prepayment. A man in difficulties may forget to point out when he is raising money his exact position as respects all the property found on his premises. The apprehension will prevent arrangements for acquiring machines on easy terms, but architects and surveyors who may be engaged in cases connected with machinery will do well to remember that in most cases a machine must henceforth be considered as a fixture.

### THE ENCYCLOPÆDIA BRITANNICA.\*

THE subjects which are treated in the seventh volume of the supplementary series of the "Encyclopædia Britannica" are no less varied and important than those in the preceding volumes. The first article relates to Mosaic, and is from the pen of Sir W. B. RICHMOND, R.A. He begins by remarking that "the art of mosaic has never been deeply implanted in the artistic sensibilities of the North of Europe, nor has it been employed much either in France, or Germany, or England. It ceased to be generally adopted in Italy when fresco, oil and tempera painting came into vogue." Reasons are given for the indifference to mosaic decoration. So long as efforts were restricted to imitations of paintings in oil or fresco there could not be success. According to the writer, "The very first principles which go to make a fine picture are just those which should be avoided in mosaic—elaborate modelling, delicate transitions of light and shade, and picturesque effects of dark and light—materialistic resemblance indeed. The designer for mosaic should ever

bear in mind his material, and in his designs for it he should accentuate those characteristics which belong essentially and specifically to mosaic and to no other technique." Sir W. RICHMOND is opposed to the execution in Italy of mosaics for English buildings. All mosaics should be executed on the wall under the direction of the designer. He maintains that in those by him in St. Paul's the work "was conducted on a right basis, and not on the wrong and futile method previously employed in England." When executed in that way mosaic is likely to be more costly than if produced in a manufactory, and the demand will therefore be restricted.

The article on Mural Decoration, by Mr. WALTER CRANE, also refers to the difficulty of producing mosaic corresponding with the work in Ravenna and Venice. "It is," he says, "perhaps the most difficult method to use with success in a building not originally intended for such decoration, or where carved architectural ornament competes with it, especially where the difficulty exists (which is always present) when it is sought by moderns to decorate a building of another age." As respects fresco, it is remarked that "unless some means can be found of enabling the actual painted wall to resist the natural dampness of the English climate, it does not seem likely that true fresco can ever be really naturalised in Great Britain." Among experiments Mr. CRANE refers to his own work in Redcross Hall, in which ordinary oil-colours with turpentine as a medium were used on fibrous plaster. Recent efforts in tempera painting on the method described by CENNINO CENNINI are commended. Something is said about the varieties of wall-papers. As to stencilling, it is remarked that "house painters and decorators do not use stencils much except for small borderings and corners, where they usually have a mean and cheap effect; but used as a means of covering a wall with a bold field of floral repeating pattern of an abstract kind, they may be quite sufficient and agreeable." The coloured poster is described as the real modern equivalent for mural decoration. While the largeness of the figures and the bold and simple colouring are admired, commercial exigencies are said to have a vulgarising effect on the work, and therefore "a serious school of design cannot be expected to arise out of such conditions."

The article on the allied subject of Ornament, by Mr. L. F. DAY, is rather short. He says the designer should transfigure instead of imitating natural forms. It is pointed out that national characteristics in ornament are becoming rare owing to international traffic. The question of pattern is now important, for it is supposed by amateurs, at least, that a more free arrangement is possible. Mr. DAY holds that the designer's "first business is to build patterns upon lines, if not intrinsically beautiful at least helpful to the scheme of decoration." Professor A. H. CHURCH writes on Pigments, and a surprising amount of chemical knowledge is conveyed in half a dozen columns.

Another subject treated by a master is Portraiture, by Sir GEORGE REID, ex-president of the Royal Scottish Academy. He gives a brief history of the art. Among the artists who are now practising in this country he cites WATTS, ORCHARDSON, SARGENT, OULESS, SHANNON, FILDES and HERKOMER as worthily carrying on the best traditions of the art. A print from Sir G. REID's *Professor Mitchell, D.D.*, is introduced as an illustration.

All lovers of Greek art and literature will find in the paper on Mycenaean Civilisation, by Mr. D. G. HOGARTH, an admirable résumé of the latest conclusions on one of the most important of subjects. When SCHLIEMANN discovered corpses "smothered in jewels" at Mycenæ in 1876 he did not realise the full importance of the site. It has since been ascertained that "Mycenaean civilisation was a phase in the history of all the insular and peninsular territories of the east Mediterranean basin." Traces have been found in a region extending from Malta to Paphos. Not only the isles of Greece but parts of the mainland display evidence of the mysterious influence, but how it arrived at Mycenæ has yet to be determined. Another Greek subject with which Mr. HOGARTH has been associated is Naucratis, from which the British Museum was enriched.

From Mycenæ or Naucratis to a modern city like New York the distance is vast. The architectural transformation of New York through the agency of steel is described,

\* The new volumes of the *Encyclopædia Britannica*, constituting combination with the existing volumes of the ninth edition the tenth edition of that work, and also supplying a new, distinctive and independent library of reference dealing with recent events and developments. The seventh of the new volumes, being volume xxxi, of the complete work. (Published by the *Times*, London.)

but it has to be acknowledged by Mr. ALBERT SHAW that "no great metropolis, however, had done so little as New York to produce those notable effects in architecture that are derived from the symmetrical and balanced placing of buildings of a public character with reference to each other, with suitable approaches and with open spaces about them; and no other great and rich city of any period of the world's history, perhaps, was so lacking in the embellishment of great public fountains, heroic monuments and groups of statuary."

Among the biographies are one of WILLIAM EDEN NESFIELD, by the late J. M. BRYDON, and one of JOHN LOUGHBOROUGH PEARSON, R.A., by Mr. W. D. CARÖE. Of the latter it is said, "Pearson's church plans possess great variety and interest. The management of choir and sanctuary evidences much individuality, and the side chapel is frequently treated so as to give additional scale to the building. In general design he first aimed at form, embracing both proportion and contour; and his work may be recognised by accurate scholarship coupled with harmonious detail. Its keynotes are cautiousness and refinement rather than boldness." NESFIELD served with his uncle, ANTHONY SALVIN, as well as Mr. BURN. In his twenty-fourth year he commenced practice in London. "Three years afterwards began a nominal partnership with NORMAN SHAW, the artistic fruits of which have sometimes been exaggerated; they shared rooms in Argyll Street for some years, but never collaborated in any design." NESFIELD planned Cloverly Hall when he was twenty-nine. There was more of a developed taste in Kimmel Park, and the two are the typical examples of his style. His career was rather short, for he retired from practice some years before his death in 1888.

The references to a few of the articles in the seventh volume are intended to be suggestive of the comprehensiveness of the work. There are many articles which are scientific and practical, such as those on Power Transmission, Photography, Motor Vehicles, the Phonograph, Ore Dressing, Ordnance, &c. Owners or occupiers of houses may derive a lesson from what is said in the article on Negligence, viz.:—"Ordinarily a man is responsible only for his own negligence and for that of his servants and agents acting within the scope of their authority. For the acts or defaults of the servants of an independent contractor he is not liable. But in certain cases a stricter obligation is imposed on him by law. The occupier of premises is under a duty to all persons who go there on business which concerns him to see that the premises are in a reasonably safe condition so far as reasonable care and skill can make them so. Thus he cannot release himself by employing an independent contractor to maintain or repair the premises. The effect of this doctrine is that the occupier may be liable if it can be shown that the independent contractor, or his servant, has been guilty of a want of due care." If in the volume one class of articles seems to engross most attention, it is that comprising such subjects as Pathology, Physiology, &c. A glance at them is enough to suggest how empiric is the ordinary medical practitioner's system of dealing with disease. The prefatory essay treats of "The Influence of Commerce on International Conflict," and is by Mr. FREDERICK GREENWOOD. Fifty years ago it was taken for granted that commerce would overcome war. It is now evident that a new market may become a *casus belli* as easily as an insult to an ambassador. The volumes must have the effect of clearing away many similar illusions, and on that account they are among the most valuable products of the printing press.

**The Land Agents' Committee** of the Surveyors' Institution met on Tuesday, 18th inst., at the offices of the Irish branch, 110 Grafton Street, Dublin, Mr. Alfred H. Wynne, F.S.I., in the chair. The minutes of last meeting having been read and signed, the committee entered upon the consideration of several matters of moment to Irish members of the Institution, which it is intended to bring before the Council in London by deputation. A deputation was also appointed to wait upon the Chief Secretary for Ireland to submit the views of the committee on questions dealing with the forthcoming Land Bill. Amongst other business transacted applications from leading land agents desiring admission by election to the membership in Ireland were dealt with, after which the committee adjourned.

### MORRIS'S RED HOUSE.

"THE Red House," Bexley Heath, which in a few days is to come under the auctioneer's hammer, was described by Dante Gabriel Rossetti as "more a poem than a house." And indeed (writes a *Daily News* representative) it was the cradle of so much that is noble and true in our life of the beginning of the twentieth century that when I bent my steps towards William Morris's old home it was with the feelings with which one enters on the reading of a stately and beautiful romance.

Think of the houses turned out forty years ago, to the order of prosperous aldermen and successful contractors, those "sensible houses, with no nonsense about them," brick boxes with lids of slate; or perhaps affecting to be "artistic" and "genteel," with utterly incongruous stucco ornament. Think, too, of the houses of more pretensions, ugly and slavish copies of the classical buildings of old Greece, or a mean and meaningless muddle of the Gothic, the whole spirit of which had died out amid the hurry and clamour of our factories and market-places.

The spirit that treated use and beauty as things apart, and saw not the usefulness of beauty, that believed the multiplication of machines a greater thing than the enriching of life, seems to us to-day stupid, but at the beginning of Queen Victoria's reign it had well-nigh engulfed the nation.

However, in the world of ideas the note of revolt had already been sounded, and in the romantic pages of Scott and the wonderful visions of Keats and Shelley men's souls had sought relief from the dreary commonplace of a life founded too exclusively on the maxims of Mr. Wordly Wiseman. It was just when the new influence was beginning to spread to the world of art that William Morris and the brilliant circle of which he formed part were in the flush of their youth and the heyday of life's summer. Morris had published in 1858 "The Defence of Guinevere and Other Poems," which, although cast into the shade by the more musical and brilliant work of Tennyson, struck a higher and more splendid note of passion, which marked the young writer as one of the finest spirits of the time. Ford Madox Brown, Swinburne and Burne-Jones were among his intimate friends, and so was Dante Gabriel Rossetti, under whose imperious influence he had abandoned architecture as a profession and taken to painting, in which he never became more than an imitator of his friend.

Morris, too, had just met at Oxford the beautiful Jane Burden, whom he married, and whom Rossetti never tired of painting. It was then that he began to discover his wonderful power in decorative art, and with the aid and stimulus of his circle of choice spirits to wage war on the universal ugliness of the life around them. Not only houses, but furniture and every object of common use had descended under the pressure of the utilitarian spirit to a hideous depth of plainness, and it was theirs to charm back the Spirit of Beauty into our daily life.

And first and above all it was necessary for Morris to have as his workplace, the background of his inner life, a home which should in some sense realise the new spirit. What could be a prettier notion than that this background should be provided in the house to be erected for himself and his newly-wedded bride? All the friends joined with enthusiasm in the idea, they would enshrine Morris and the work of which he was to be the active head in a scene which should be—to steal the title of his later famous poem—an "earthly paradise."

Thus it was that the Red House came to be built. Amid the flowery-lanes of Kent, on the very ground the "Canterbury pilgrims" of old Chaucer had trod, and where John Ball had stirred up the carles and yeomen of the south, a beautiful orchard was bought, and the building of "the house beautiful" began.

The architect was Philip Webb, another of the brilliant group, in whose hands the house became not a mere survival of dead Gothic forms, but an application of its spirit to the needs and circumstances of the time. It was the first example of the revived use of red brick for domestic architecture, and thus became readily known throughout the district as "The Red House." It was the mother of thousands of such houses which now grace our English landscapes from sea to sea, and Mr. Norman Shaw owed much of the inspiration of his fine work in our London streets to this original.

And what a happy time was spent in the early years of Morris's wedded life, when in their charming home they kept open house to a circle of bright spirits, all of whom combined to make each detail of furniture and decoration perfect. Every article, every utensil, had to be designed and manufactured on purpose for the house, to escape the debasing influence of universal machine production—and the making of the home was thus a constant experiment and lesson, which aided the business of artistic manufacture.

It was a royal time. Here the "idle singer of an empty day" took his fill of beauty, tended his grounds in his blue shirt, till, with their wattled rose-trellis, bowling-green shaded by apple trees, quaint beds, green alleys and trim hedges, they

became the very type of a restful old English garden. And month by month the young friends foregathered here and perfected each detail of beauty, till Rossetti himself declared that it had become "more a poem than a house."

Sadly enough, after five years in this house, where his two daughters were born, Morris had to leave, in order to keep a firmer hand on the growing business which he afterwards made such a triumphant success.

It was growing dusk as I approached this sacred spot, the very birthplace of beauty in these realms. With its steep-pitched roofs of dark red tiles, its low, overhanging eaves, low, wide porches and clinging ivy, the house seemed to embody the very spirit of repose. Through the massive oak door I stepped into the entrance hall, and there and in other rooms noticed the red-brick fireplaces with a slight start. The spaces of plain red brickwork seemed for a moment as though one was mistaken, and had accidentally stepped outside, until one realised how much finer and more natural were these fireplaces, with their plain brass and iron and entire absence of added ornament, than the pictorial tiles and cast-iron leaves and flowers with which the builder even to-day insists on decorating our domestic hearth. This throughout was the spirit of the house; grace and strength of form, but an utter absence of trivial decoration. Not that applied ornament was missing; the drawing-room walls contain scenes from Chaucer done in distemper by Burne-Jones, and the armoire in the hall a painting dealing with a subject from the "Niebelungenlied," by Morris himself, showing curiously his efforts at copying the style of Rossetti. Mrs. Morris, too, whose face we all know so well from a score of pictures, stencilled with her own hands the decorations of some of the walls and ceilings, and Morris's own work is to be seen in the stained glass of the windows. The house, with its well sheltered by a conical candle-extinguisher of red tiles, gives an impression of harmony and grace and restfulness such as no combination of architectural "features" could have produced. The beauty is the building's own, not a meaningless line is in it.

#### BERKS ARCHÆOLOGICAL SOCIETY.

THE first meeting of the winter session of the Berks Archæological Society was held at the Abbey Gate, when an interesting lecture was given by Mr. O. A. Shrubsole on "An Ancient British Barrow containing Cinerary Urns at Sunningdale." The Rev. Alan Cheadle presided.

Mr. O. A. Shrubsole, according to the *Reading Mercury*, said the subject of graves and dead men's bones was not an attractive one, but it was a subject which, if pursued reverently and scientifically, was capable of yielding very fruitful results. Remarkable discoveries had been made quite recently in Egypt in this direction. The cinerary urns—specimens of which were recently found at Sunningdale—showed what a lot of trouble the people took with regard to the burying of their dead. They saw at once there was a great deal of civilisation behind it. With regard to the particular urns before them, the body of a person had been cremated, the ashes collected and placed in an urn, which was deposited in a convenient place. Then, too, they found a number of ideas connected with this practice. At a very early period, before that represented by those urns, the bodies of persons were placed in a chamber in a large mound, the chambers representing houses. Here they had a situation pregnant with ideas—that the dead person would appreciate the comforts of a house. There was an instance in this county where a deposit of charcoal was found, it evidently being thought that the dead person would be able to warm himself. It was frequently found that the earlier ancient Britons buried their dead without cremation. They used to lay the corpse in a reclining or sitting position in a huge mound of earth, and put vessels of food and drink near. All investigation pointed to the fact that as far back as they could go in the Neolithic ages social distinctions existed. This was evident from the fact that some of the burials were on a larger and more costly scale than others. The mounds and urns in one case would be large, and in another small. The urns found at Sunningdale were of great variety, and the mounds in which they were found differed in size. They belonged to the Bronze period. These urns were found upside down, and he had no doubt that in certain cases the people thought it undesirable that the spirit of a dead person should escape, and so inverted the urns to prevent this. There were other tumuli in the immediate neighbourhood of Sunningdale which had not been examined, and he would like all landowners, and those who had influence with landowners, to know the great desirability there was to have these "barrows" examined. But for the intelligent care of Mr. W. G. Craig (of the firm of J. D. Craig & Son, contractors, Camberley) they could have known nothing whatever about these tumuli. They saw how difficult it was to strike out anything new in this

world; at the present moment there was an agitation for the substitution of cremation for inhumation. London had just started a crematory, and he (Mr. Shrubsole) wished it every success. No doubt the ancient Britons were much more practical in sanitary science than we were at the present day.

On the proposition of the Rev. P. H. Ditchfield a hearty vote of thanks was accorded to Mr. Shrubsole for his instructive lecture.

Mr. J. D. Craig spoke of the finding of the urns, numbering altogether about twenty-three. The proprietors of the land, however, were hurrying them in getting the ground turfed over, and they did not have quite so many opportunities for research as they wished. These urns remained in a stable for two months, and it was a wonder they had not been unknowingly destroyed.

Mr. Ll. Treacher said there seemed to be two kinds of burial-places. In one case the dead were cremated and their remains placed in urns; in the other, where the bodies were not cremated, the remains were deposited in elongated mounds. He had recently read an article on the subject, and the writer's theory of this was that people in times past who buried their dead in the round "barrows" entertained the doctrine of the immortality of the soul, while those who used the elongated mounds believed in the resurrection of the body. The writer traced the connection between these latter and the graves we now saw in our churchyards.

Mr. Shrubsole pointed out that the idea of the immortality of the soul had been recognised as far back as they could go with regard to man's thought about himself. They never could conceive of themselves or of anything ceasing to be. The theory of their predecessors was that there were two parts in everything—a body and a spirit; the body might end, but the spirit continued. When a person slept, the theory amongst uncultured races was that the spirit for the time left, and returned when the person awoke.

#### VAUXHALL BRIDGE.

AT the meeting of the London Council on Tuesday the bridges committee presented their report with regard to Vauxhall Bridge, recommending—"(a) That the resolution of the Council of February 22, 1898, directing that the new Vauxhall Bridge be a granite bridge backed with concrete be rescinded; (b) that the estimate of 170,000*l.* submitted by the finance committee for the building of the superstructure of the new Vauxhall Bridge be approved, and that an expenditure up to the amount be sanctioned; that the design submitted, showing a steel elliptical arch structure, be adopted, and that the engineer be instructed to prepare the necessary contract, plans and specification."

Lord Monkswell stated that the report of the bridges committee had been before the general purposes committee, who had expressed a desire that further information might be given. He asked that the report might be withdrawn for that purpose.

Mr. Sears declined to take that course.

Lord Monkswell said the reason given by the committee that they could not make the spans of a granite bridge conform with the Act of Parliament was not a sufficient one for asking the Council to reverse its whole policy with regard to the bridge. Parliament might see its way to modify some of the details so as to permit a granite bridge to be erected. It now, however, appeared that that was not the only reason for asking for a reversal of the Council's policy, and he thought they should have the fullest information before the Council before they came to a decision on the present proposals.

Mr. Sears (vice-chairman of the bridges committee) said it was after careful consideration and with some regret that the bridges committee had decided to alter the design. The decision had been arrived at on two grounds. The first was that stated by Lord Monkswell, not so much that the spans of the bridge could not be built in accordance with the Act of Parliament, but that, owing to the increased strength of centering, it would be impossible under the Act to form that centering with the headway throughout the whole width as required by the Act. An even more material reason was that a difficulty had arisen with regard to the foundations already constructed. When the original borings were taken, it was thought by the then engineer that they would have arrived upon the hard blue clay, and would have been able to secure sufficient strength of foundation to carry a heavy granite bridge. But it had been discovered that that was a mistake, and that the clay was of a softer nature than was originally expected. They were not on the blue clay, and when the cofferdams had been constructed it was discovered that the clay was not capable of carrying a heavy weight. It was then too late to make any alteration and to increase the width of the foundations in order to carry a granite bridge. No responsibility for this rested on the present officers, and they

were acting upon the advice given by the present officers. They looked at the matter as practical men. It was no use seeking to go back and regretting what had been done. The opposition to the steel type of bridge came entirely from artists and from those who thought it would not be so artistic as a granite bridge, which they considered would be more harmonious with the surroundings. Even if that was so, it did not follow that a steel bridge was incapable of artistic treatment. The essential point was that, whatever material they used, the design should be suitable for the material. The engineer told him that the plan put up in the hall was only the first sketch. The details of ornamentation and finish were yet to be considered, and the engineer had offered to consult with the architect of the Council with regard to the artistic finish of the bridge. The engineer said he could not take the responsibility of building a granite bridge upon the piers.

Mr. Strauss supported the recommendation, and declared that whatever type of bridge they put up there would always be a certain amount of artistic prejudice against it.

Mr. Ward said they must consider the utilitarian side of the question before the artistic. No one could say that Westminster was an ugly bridge, and the one now proposed was like Westminster in many of its features.

Mr. Beachcroft asked what they had been doing if after five and a half years they found they were mistaken in the composition of the bed of the river. It revealed a state of things which no municipal body should pass over *sub silentio* or without the fullest possible information. He therefore moved that the report be referred back to the committee for further information.

Mr. R. A. Robinson seconded the amendment.

Mr. J. Burns, M.P., declared that outside criticism on this matter was both unfounded and undeserved. He knew that considerable delay had already occurred over the rebuilding of Vauxhall Bridge, but that was partly owing to the requirements of the Thames Conservancy. The bridge was urgently required, and he hoped that there would not be further delay. The Council had listened too much to the voice of so-called culture, and whenever in the past it had departed from its primitive common sense and abandoned its own idea of what was beautiful at the instance of artists, it had always been led into pitfalls.

Mr. Emden supported the recommendation of the committee. He declared that they had before them every information to enable them to come to a conclusion on the subject. If they put up at Vauxhall another such structure as Westminster Bridge they would have nothing to fear from criticism in the future.

Mr. Dickinson asked that the report might be put off for a week or two in order that the public might be convinced that it was impossible to put up a granite bridge at Vauxhall.

After further discussion the amendment was rejected by a large majority.

The recommendations of the committee were then adopted.

The following letter from Professor Beresford Pite has appeared in the *Times*:—The London County Council will shortly have to come to a fresh decision upon the design of this bridge. It is a matter which presents many problems of importance to the public, not only as to its sufficient width and suitable gradient for dignity and use, but as to its construction, whether of stone arches, concrete cantilevers, or steel arches and girders, each of which methods have at one time been considered. There are also artistic problems of an architectural character to which public attention should be directed, as a building of this magnitude forms a sufficient monument of the taste and feeling of the generation which erected it to merit the earnest attention of all who are capable of being influenced by beautiful objects and their characteristics.

In a work of the magnitude and character of this great bridge the grandeur of the simple lines of the constructive arches and piers, and the rising curve of the roadway gradient, have sufficient meaning to give interest to the whole structure. Mere applied ornaments in such a case are needless and wasteful superfluities. They cannot add beauty or meaning, or afford scale or increased dignity to the vast structure to which they would be attached. Monumental statues might be placed upon the piers as affording convenient pedestals adjacent to the roadway, but the bridge as a design would gain nothing from such adornments owing to the great difference of scale involved. It will be a wise economy in the interests of art and of the public purse to reject the cost of any ornamental features on this bridge. The Council have already decided, in deference to the views of the public and of artistic authorities, to erect a granite bridge, though confining this material to its surface, and proposing to construct the bridge of concrete cantilevers upon the design of Sir A. Binnie, its former engineer. The concession of granite instead of iron was a considerable gain in principle, monumental effect, and the possibility of an effective architectural treatment being afforded,

as well as increased permanency and the economy of perpetual repainting.

The gain, however, in principle proved illusory in application, as a granite design was approved by the Council involving the use of an abundance of very bad architectural detail in a most inartistic way with meretricious contrasts in different coloured granites. That the artistic parts of this design fell into incompetent and unknown hands was much to be regretted, as the severe beauty of London Bridge and the simple effectiveness of the newer Putney Bridge would have ever demonstrated. A granite bridge, whether of good or bad architecture, is however now abandoned by the committee in charge, and the Council are to be asked to adopt a steel design by their new engineer. It appears that the committee fear difficulties in the execution of a granite or granite and concrete bridge which another application to Parliament would have to remove. This reason, in view of the large amount of time expended upon preliminaries already, should not be allowed to weigh with so permanent a work, and the powers required ought to be obtained to properly complete the bridge to a good design.

Should, however, the Council decide otherwise, which it is to be hoped they will not do, and Mr. Fitzmaurice's new scheme is to be developed and carried out, attention should at once be called to the artistic character of the new design. Examination of the drawings recently on view at the Council chambers shows that the engineering factors of form and line in construction simply expressed will have a perfectly satisfactory effect, and need only to be externally emphasised by the simplest arrangement of the lines.

It is, however, thought necessary to apply to the engineering design some would-be Gothic architectural forms of great vulgarity and stupid want of meaning, against which all people of intelligence and taste will incessantly protest, if carried out. Let us ask the need to imitate badly in cast-iron, upon an essentially modern steel bridge, the forms of Gothic stone tracery of the Middle Ages, and in a method unworthy of even a churchwarden of the early nineteenth century? The Council could do nothing more certainly to mark ignorance and want of taste in architectural matters than to permit the perpetration of the ornamental parts of this design.

The stonework piers which support the steel arches are also terribly mauled in this same design by the Gothic spirit, and evidence gross ignorance of simple architectural design. On the whole subject it is easy to be angry and yet to feel that wrath may be useless; but an earnest appeal should be made to the London County Council to avoid the pitfalls of would-be artistic design from untrained hands, and to authorise their engineer, for whose skill as a constructor all London will be glad to cherish esteem, to seek competent and responsible architectural advice, so that an engineering success may not become an artistic abomination, a quite needless, though frequent, achievement of the last century, which, we are sanguine enough to hope, may not in the newer age or be any longer considered inevitable.

In conclusion, the better and more monumental granite bridge of good design and permanent construction is what has been promised to London, proposed and authorised by Parliament; and this should certainly be carried out.

## ST. AIDAN'S CHURCH, DRUMCONDRA.

ST. AIDAN'S CHURCH, Drumcondra Road, co. Dublin. It was dedicated on Saturday last. The new church, although it is an unpretentious building externally, is not lacking in points of architectural beauty, and it is admirably adapted to serve its purpose. It consists of a nave measuring internally some 68 feet in length and 24 feet in breadth, with a side aisle 14 feet wide and 60 feet long, separated from the nave by an arcade of five bays. The arches are built in brick, thus affording a pleasing harmony in colour with the cool grey of the walls. The arches are supported on Bath stone piers, alternately octagonal and circular, with moulded capitals and bases. The chancel measures 24 feet by 14, and has a well-proportioned three-light lancet window over the holy table, and a pair of smaller lancet windows in the side wall admit the light of the southern sun. The chancel arch, all of Bath stone, with richly-carved bases or corbels to the responds, is one of the most effective architectural features in the church. The roof of the nave, chancel and north aisle is an open-timbered one, all constructed in pitch pine. The chancel is tiled, as are all the porches, and the rest of the church floor is laid in wood-block flooring, which is warm and silent to the tread. The old organ from the iron church has been erected in a temporary organ chamber in the south wall of the nave adjoining the chancel, and seating accommodation for the choir is provided in close proximity. The architect was Mr. R. Caulfield Orpen, B.A., from whose designs and under whose direction the entire work was carried out.

## PROTECTION OF STEEL FRAMING.

A REPORT has been prepared by Professor Charles L. Norton, Massachusetts Institute of Technology, who is in charge of the laboratory of the Insurance Engineering Experiment Station, Boston, on the corrosion of steel. An abstract of the report is given by the *Engineering Record*. The difficulty of cleaning the steel as done in the experimental work is so costly on the scale of practical building construction as to be prohibitive. It is true that structural steel is cleaned, but the result of the cleaning satisfies only a much less exacting definition of the term, clean, than that used in a laboratory. Protective coatings for steel are legion, and probably some of them would be effective if applied to the steel; but it has been the writer's common observation that the coating was put to a large extent upon rust, scale or foreign substances on the surface of the steel rather than upon the metal. The trouble is further increased by the fact that if the steel should be perfectly cleaned it would not remain cleaned long enough to be coated by the usual commercial processes. Absolutely clean, bright steel will flash rust, when exposed to atmospheric moisture, almost as rapidly as powder will flash fire. It would seem then, that what the practical constructor needs to know is not alone, or so much, what happens to steel when cleaned and coated under laboratory conditions, but rather what befalls the steel as ordinarily manipulated in the operations at mill and shop and in building construction. The latter line of investigation, it is understood, the director of the Insurance Engineering Experiment Station hopes to undertake in the near future, and in this undertaking he invites engineers and architects to co-operate.

The problem of steel framing for a textile factory, bleachery or dyeworks, paper and pulp mill, and the protection of the metal from both heat and moisture, is a very much more difficult one than the construction of a department store or office building. The working of the fibres of cotton and wool requires a constant humidity at a rather high degree, the working of pulp and paper generates great volumes of vapour which must be guarded against.

The constantly increasing use of steel as a structural material in modern buildings has led to many questions as to its permanency. The examination of buildings ten to fifteen years old, when, during alterations, the steel framework has been exposed to view, reveals all stages and conditions of disintegration of the steel. So great has been the corrosion, even in this short time, in some cases, that a note of alarm has been sounded by some engineers most familiar with the subject. The use of steel beams and posts is of so recent date that no very exact deduction can be drawn as to the time required for a very serious or destructive loss of steel through corrosion; but surely, when a steel plate one-half inch in thickness loses more than one-eighth inch in five years, there arises a question as to the ability of the structure to last more than twenty-five years.

Some of the factors in the matter of corrosion of steel we know; others we do not know, and cannot until after a lapse of some years. There can be no question that moisture and carbon dioxide are the active agents in causing much of the rusting of steel. To what extent the two are relatively responsible and in what measure they need renewal, to keep up the process, is uncertain. It has been held that the formation of a coat of rust upon the surface of steel was the beginning of a progressive action whereby the rust or iron oxide acted as a continuous carrier of oxygen to the steel beneath. This process seems to require only moisture and atmospheric air containing carbon dioxide to start it, but as to the depth of penetration of the process, no assignable maximum in any given time is known.

There can of course be no question as to the ease of access to the steel, in many cases, of both moisture and carbon dioxide. When steel is bedded in the wall of the building, as is almost always the case, the changes in temperature from time to time, is well as the more or less constant difference in temperature between the two faces of the wall, tend to cause a condensation of moisture in the wall at different points. Further, the necessary carbon dioxide is most plentiful in the large cities, where the steel frame is most common. When the walls of the building are of brick or stone moisture and carbon dioxide may enter at the joints, and to a greater or less extent through the body of the stone or brick. Few stones are, however, porous to such an extent as to allow an appreciable penetration. Terra-cotta tile is of itself porous, and the existence of air passages tends to increase the condensation of moisture and its absorption by the terra-cotta and possible contact with the steel. Concrete, made of Portland cement with sand and either cinders or stone, would seem to offer more protection to the steel than any of the materials just mentioned; yet we hear of the loss from time to time by corrosion of steel bedded in concrete.

It has been held by several engineers that the mere alkaline nature of Portland cement was a sufficient guarantee of its protecting steel from rusting. There is, of course, good

chemical reasoning for this, the familiar use of strong alkaline solution in boilers to prevent the formation of scale being based upon the same principle. This would seem to settle the matter once and for all, were it not a fact that steel bedded in concrete has corroded very rapidly, while other steel in a different concrete of the same kind of cement stands without change for ten years or more. An examination of several cases where expanded metal had been embedded in concrete showed plainly that wherever the steel was exposed through cracking rusting began, even though the cracks were very fine. It would seem that the alkaline nature of the cement would be sufficient to prevent corrosive action occurring within a few hundredths of an inch on the moist surface of the steel, but such is not always the case. To study the matter systematically, two brands of American Portland cement (Alpha and Lehigh) were selected; two kinds of cinders, one from a sugar refinery, the other from Boston and Albany locomotives; a sharp, clean beach sand; and a hard, clean broken stone, the larger part being fragments of flint and trap rock. Concretes were made up in bricks about 3 by 3 by 8 inches, with the steel specimens near the centre.

The following mixtures were tried at first:—Neat cement; cement, one part, to three of sand; one cement to five broken stone; and one cement to seven cinders. All briquettes were made in duplicate with both cements. There were later made up briquettes of one part cement, two sand and five cinders, and of one cement, two sand and five crushed stone.

It was hoped to vary the density, the porosity and the nature of the contact with the steel, as well as the chemical composition of the concretes. The cements were tested chemically and physically and found good. The cinders, when washed down with a hose stream and dried, tested distinctly alkaline, and analysis revealed very small amounts of sulphur. The stone and sand were thoroughly washed and clean. The ingredients were mixed dry in every case, and when wet thoroughly mixed and tamped until wet on top.

The cleaning of the steel was the most troublesome problem met with. It was necessary to scour the pieces, then pickle in hot dilute sulphuric acid, and finally dip into hot milk of lime. When cold the lime was removed with a wire brush. This left the steel clean and bright, ready to be put into the test bricks. The specimens used were a mild steel rod 6 inches long and  $\frac{1}{4}$  inch in diameter, a piece of soft sheet steel 6 by 1 by  $\frac{1}{32}$  inch, and a strip of expanded metal 6 by 1 inch, all three pieces being put in each brick. Since time would not permit of exposing these specimens to natural conditions, they were enclosed in several large tin boxes, sealed tightly and subjected, one-quarter of them to an atmosphere of steam, air and carbon dioxide, and a second quarter to air and steam, a third to air and carbon dioxide, and a fourth stood upon the table of the room, with no special care as to their temperature or dryness. Of the entire number, about one-half were set in water for one day the rest for seven days, before sealing up.

At the end of three weeks the briquettes were carefully cut open and the steel examined and compared with specimens which had lain unprotected in each of the tin boxes. The neat cement specimen can be dismissed without discussion, for the protection was perfect. The steel was as bright as when put in. The unprotected pieces were found to consist of rather more rust than steel. The steel was wrapped about pieces of uralite, to serve as a means of identifying it by number, the stamped numbers being nearly obliterated by the rust. Of the remaining specimens, hardly one had escaped serious corrosion. The location of the rust spot was invariably coincident with either a void in the concrete or a badly rusted cinder. In the more porous mixtures the steel was spotted with alternate bright and badly rusted areas, each clearly defined. In both the solid and the porous cinder concretes many rust spots were found, except where the concrete had been mixed very wet, in which case the watery cement had coated nearly the whole of the steel like a paint and protected it. Some briquettes made later of finely ground cinders and cement in varying proportions when exposed to moisture and carbonic acid showed how effectually the presence of cement prevented rusting, even in a highly porous mass—one cement to ten of cinder, provided there were no cracks or crevices or distinct voids.

From the examination of these several hundred briquettes there have been drawn several conclusions:—First, neat Portland cement, even in thin layers, is an effective preventive of rusting. Second, concretes to be effective in preventing rust must be dense and without voids or cracks. They should be mixed quite wet where applied to the metal. Third, the corrosion found in cinder concrete is mainly due to the iron oxide, or rust, in the cinders and not to the sulphur. Fourth, cinder concrete, if free from voids and well rammed when wet, is about as effective as stone concrete in protecting steel. Fifth, it is of the utmost importance that the steel be clean when bedded in concrete. Scraping, pickling, a sand blast and lime should be used if necessary to have the metal clean when built into a wall.

## NOTES AND COMMENTS.

THE strange story of the Diamond Necklace is recalled in Paris by the preparations for the demolition of the Imprimerie Nationale. That building was originally the Palais Cardinal, or Hôtel de Strasbourg, which was erected by ARMAND GASTON DE ROHAN, bishop of Strasbourg, when he was raised to the cardinalate. He was the dupe in the necklace affair. His palace became the Government printing office on the Bank of France acquiring the building formerly used for that purpose. At one time there was a large garden near the palace, which until 1808 was open for public use. There are some relics of the eighteenth century which will be removed to various museums. The carved woodwork is of great interest. But the most curious part of the building is the "Cabinet des Singes," which, according to tradition, was the cardinal's bedroom. CHRISTOPHER HUET painted the walls up to the ceiling with numerous figures of monkeys.

THE French ambassadors in Rome have occasionally occupied some of the most famous palaces. All the world knows that buildings of the kind, however grand or historic, are usually let out to a number of tenants, and an ambassador has as much right to hire a floor or a few rooms as any other visitor. Latterly the Rospigliosi Palace was occupied by the French Embassy, but the lease expired at the end of last year. It was not the first time to be so used. MAZARIN purchased the building from the BENTIVOGLIO family in order to convert it into a French palace. It was adorned by GUIDO's *Aurora* among other works. In 1704 it ceased to be French property. The building selected for occupation is the Santa Croce Palace. It was designed by FRANÇOIS PAPARELLI, and from 1769 to 1792 was used as a residence by Cardinal DE BERNIS, who was the representative of the French Court in Rome. In the court are several bas-reliefs. In the rooms are examples of Italian painting. The palace does not stand in one of the fashionable quarters of the city, but the rent charged for the first floor will be 25,000 frs. a year. In addition there will be an outlay on alterations which will be carried out under the direction of M. CHEDANNE. As the term of the tenancy is ten years, there is no likelihood of an immediate change in the relations with the Vatican.

THE invitation of the Liverpool Corporation to architects for designs for workmen's dwellings was responded to by the preparation of forty-five sets of drawings. Mr. THOMAS BLASHILL was appointed assessor. His award is as follows:—First premium of 250*l.*, Mr JAMES DOD, Exchange Buildings, Liverpool; second premium of 150*l.* to Messrs. BROCKLESBY, MARCHMONT & EAST, of Merton, Surrey; third premium of 100*l.* to Mr. A. MITCHELL TORRANCE, of London. The designs by the following architects were highly commended, viz.:—Mr. HUON A. MATEAR, of Liverpool; and Messrs. WORTHINGTON, SYMON & CRAWFORD, of Manchester; Messrs. SPINKS & M'JARROW, of London; and Messrs. GROVER, HALFORD & CUTLER, of London.

THE utmost praise which any member of the London County Council could bestow on the new design for the Vauxhall Bridge was that it resembled Westminster Bridge. That was Mr. EMDEN's opinion. It was forgotten by him that PAGE's structure did not meet with general approval, especially as regards ornamentation, but it was considered to be in keeping with the Gothic Houses of Parliament, and that any other style would not harmonise with the most important of the country's buildings. It cannot be said there is a like need for Gothicising the contemplated Vauxhall Bridge, as there is no building of any importance in that style to be found in the vicinity. Unfortunately, Mediæval ornament is assumed to have been mainly geometrical, and the curved lines to be parts of circles. That mode is consequently in favour

in engineers' offices. As the superintending architect of the London County Council is to be allowed to have a share in the preparation of the working drawings, we may hope that the architectural defects which mar the design recommended will vanish.

THE pamphlet on "Artesian Well Boring"—a class of work which is one of the numerous departments of the business of Messrs. MATHER & PLATT, LTD.—is a practical treatise on the subject. The particulars of over two hundred borings which are supplied indicate the remarkable variations of strata which have to be encountered before water is reached. The success of the system is shown by the numbers of water companies utilising it for supplies. Among them are the Southwark and Vauxhall (1,035 feet), Birmingham, Grimsby, Bootle (1,300 feet), Wirral, Stockport, Canterbury, Caterham, Liverpool, Slough, Wolverhampton (920 feet), Sunderland, Richmond (1,334 feet), East Warwickshire, West Cheshire. In some cases the boring was 26 inches diameter, at Port Sunlight one is 37 inches and at Rickmansworth are two of 40 inches. A boring at Lodz, Poland, is 2,250 feet deep and 33 inches diameter. The strata which had to be pierced consisted of clay, quicksand, chalk, sandstone and marl. As a rule the sandstones have yielded the majority of the supplies. As in the case of waterworks purity has often to be sought, and brewers, distillers, mineral water manufacturers, &c., are indebted to Messrs. MATHER & PLATT. It is stated that they are able to sink a hole 18 inches or more diameter at a fraction of the cost formerly required and in much less time. The supply obtained is cheaper than if derived from other sources, even in the vicinity of towns. Messrs. MATHER & PLATT employ either the round-rope system or the flat-rope system, according to circumstances. They find that the yield is increased by the adoption of air-lift pumping, and the water has the advantage of being aerated and thus becoming more potable, while it is better adapted for some manufacturing purposes. They have also a patent process for softening water in cases where it is very hard, and special filters with capacities ranging from 6,500 to 500,000 gallons per 24 hours. Water cannot be dispensed with either for domestic or manufacturing purposes. Accordingly an increased supply is everywhere recognised as an addition to the public wealth. Messrs. MATHER & PLATT have brought the sinking of wells to a perfection such as the good people of Artois or their predecessors could not have imagined in their dreams.

THE useful handbook on "Alphabets Old and New," by Mr. LEWIS F. DAY, has been followed by another entitled "Lettering in Ornament" (B. T. BATSFORD), which is practically a history and exposition of one class of art. The examples go back to an early period, and we find that letters were appreciated not only for their use as a substitute for sounds, but from the extent to which the forms lent themselves for artistic treatment. So many upright, horizontal, inclined and circular lines were recognised as elements of ornament which, although limited in variety, could cover a space with more or less success. The letters could also be surrounded with ornament and made to form part of a panel. "The Alphabet," by GODFREY SYKES, on page 189, is as fine an example of treatment as can be found. The small volume can be of use to many, and those who may not require to form letters can learn from the examples how art became the auxiliary of literature.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair.

The following were elected as members:—Messrs. L. L. Jeeves, C. D. Power, G. R. Bryce, H. Rigg, B. G. Gwyther, J. Swarbrick, G. A. Soames and A. C. Bosson. Messrs. P. M. Holden and H. W. Roberts were reinstated members.

Mr. C. C. BREWER read a paper entitled

## Sanatoria.

The principle which seems to have actuated your committee in their invitation to me to speak to-night on "Sanatoria for Consumptives," seems to have been this, that if you invite someone who but half knows his subject you are likely to get a livelier discussion than if you put up your expert, and by so doing frighten away other speakers. I am perfectly conscious that there are others here to-night much more competent to speak than I, but I was assured by the Secretary that none were willing to take up the subject, and as it is one on which I am most anxious to obtain information, I consented to act as a bait to these gentlemen, and I can only hope that they will be drawn by my remarks to give to the meeting some of the knowledge they undoubtedly possess.

I feel, too, that I am speaking at a not very opportune moment. I had hoped that before this date something would have been known as to the outcome of the King's Sanatorium Competition. That is to say, something further than the mere awards—that the essays and plans would have been published, and that we should have had a chance of seeing and discussing the plans accompanying the prize essays on the ideal sanatorium, as judged by the leading medical specialists. However, these have not been published, and nothing is as yet publicly known as to the form the building will ultimately take.

Let it be understood that I shall confine myself to sanatoria for the treatment of consumptives by the so-called open-air or "Nordrach" system, of which the two main features are open air and abundant feeding, though Dr. Walker will tell you that it means a great deal more than this. I shall speak first of these sanatoria generally, mentioning some of the most prominent of those already built, both for paying and non-paying patients, and shall then go on, if there is time, to discuss some details of construction and fittings. I shall not tell you anything about sites, aspect, climate. Those are all more medical than architectural points, and I shall leave them to Dr. Walker, who is to speak after me, and who will give you a description of the life of a sanatorium patient and of the essential points of the treatment, and will, from her very great practical experience of the treatment, answer any questions you may put, and give reasons for many of the things that I state as axioms.

Existing sanatoria as to their plans may roughly be divided into two classes:—Firstly, those built on a concentrated plan; and secondly, those on the cottage or block system; that is to say, they vary from the large hotel-like buildings, such as Falkenstein and Hohenhonnef, in Germany, both having five floors, to Nordrach and the American Cottage Sanatoria, with quite small blocks, having two floors at most. In comparing the two systems, it must be remembered that Nordrach, perhaps the most successful of all these sanatoria, is on the cottage plan, and there can be no doubt that, from a purely medical point of view, this plan is best; but the disadvantages in working are many and obvious, both as regards convenience and economy. The medical requirements are extremely simple. Every part of the building must be (i.) Well ventilated. (ii.) Free from dust and easily cleansed. (iii.) Patients' rooms, in addition to abundant fresh air, must have as much sunlight as possible, and must be protected from cold winds. (iv.) The building must be as sound-proof as practicable. The perfect sanatorium, therefore, will be the one that fulfils these requirements, and at the same time is convenient of management and supervision, provides reasonable comfort for patients in all weathers, and has not too much the appearance of a hospital or barrack, but which must not, on the other hand, degenerate into the hotel or hydropathic establishment.

At Nordrach which is rightly called a colony, the various buildings are scattered throughout the village at some considerable distance apart; some of them have been especially built, but others, such as the administration and staff offices and some patients' blocks, are merely old buildings converted, and it is generally admitted that the success of this sanatoria has been due to management, strict régime and the personal magnetism and enthusiasm of Dr. Walther, the founder, rather than to its buildings or site.

Nevertheless, some recent sanatoria in this country have been built closely following the Nordrach plan. One lately built has its dining-room, kitchen and staff offices on one side of a little valley, and the patients' rooms on the other, at least 200 yards away, and with no other means of communication between them than an uncovered and unsheltered path. Considering that in any sanatorium a certain proportion of the patients must be confined to bed, and must at the same time be

provided with substantial and appetising meals, such a plan is surely absurd, and I can see no reason why, because a sanatorium in the Black Forest has succeeded, in spite of such an arrangement, that we should handicap ourselves with it in England, and the cottage system seems unsuitable to our climate, but would rather suggest the large building spread over as much ground as possible, and so arranged that the parts may be easily isolated.

I propose now to show you the plans of some sanatoria built in Germany and elsewhere on the concentrated plan, discussing them as they are upon the screen.

1.—*Falkenstein*.—I have placed this first, as it was one of the earliest, and now is, perhaps, the best-known, German sanatoria, having been much advertised lately through the visit of our King, and it happens to be one which I have myself seen. This building, which was erected in 1876, accommodates 112 paying patients on five floors. There is a basement occupied by very large stores, bath-rooms, and offices, with a verandah in front, and above are three floors of patients' rooms. The lay-out is ingenious, but it is doubtful whether the central recess on the plan is an advantage, for the rooms in the centre are somewhat deprived of sun. The building generally is too much of the hotel type, and the number of sitting-rooms is altogether excessive and harmful, they are difficult to supervise, and are a temptation to patients to spend too much time indoors; it being now generally admitted that patients when indoors should be as much as possible in their own rooms, which can be thoroughly ventilated, and where talking and forbidden amusements are not indulged in. There are also too many mouldings, decorations, curtains, and other dust-traps about the building. The water-closets are not detached from the main building, and the ordinary baths are poor, except for the douche, &c., which are much used, and which are situated in the basement under the staff-rooms, and here the bathing is done under medical supervision, and the taps are placed outside the rooms. The dining-room, the one really important sitting-room in a sanatorium, though a fine room, is not well placed, having only north and east aspect. The patients' rooms are 13 feet to 14 feet high, which is quite unnecessary and even inconvenient, 8 feet 6 inches to 9 feet having been found in practice to be quite an efficient and convenient height. But to take the chief objection to this plan last, the patients' rooms are placed on both sides of corridors, and it has become an axiom that patients' rooms should only be placed on one (and that, of course, the south) side of a corridor; in other words, that your patients' block must only be one room thick. This has been realised in Germany now as well as in England, as you will see in the plans of more recent German buildings which I shall show immediately.

2. *Hohenhonnef*.—This closely resembles the Falkenstein plan, but is, I think, an improvement on it, as it should be, having been built sixteen years later. The wings here are shorter, so that the centre is not so shut off from sun. The dining-room with east and west aspects and the complete blow through is better, and on the upper or patients' floor the central portion is only one room thick, and the water-closets are partially isolated. But we get the same excessive number of sitting-rooms and the same number of storeys. In both these sanatoria, which are for paying patients, there are bedrooms for visitors and friends of patients, and these, together with the number of reception-rooms, lead one to suppose that the life more nearly approaches to that in a large hotel than would be allowed at Nordrach and Falkenstein.

3. *Ruppertsheim*.—This sanatorium for the poorer classes, built about six miles from Falkenstein in 1895, is as regards plan and arrangement to be a great improvement on the former. The building was originally planned to accommodate men in the west and women in the east wing, and was so being used when I visited it; but a new sanatorium for women was then being built close by, and the whole of the old building was to be given up to men. The arc form is distinctly good, although the thickening of the ends seems a mistake, and overshadows the rooms next to them. The room and corridor plan has been adopted, so that by the use of fanlights over doors an excellent blow through may be obtained. A dining-room and a day-room are the only sitting-rooms provided, but there are ample open-air galleries. The basement contains, beside the day-rooms, douche-room, stores, cellars, heating chambers, &c.

On the first and second floors the dining-rooms occupy the centre, one being for men, the other for women, and there are small pantries off them, a certain amount of the light housework being done by patients, both men and women. The bedrooms are arranged for one, three and five beds respectively, but at the time of my visit were being used for larger numbers than these. This dormitory arrangement can only be tolerated on the ground of expense, and possibly in the case of very poor patients who, Dr. Walker tells me, do not always appreciate the luxury of a single room. But anyone who has slept for many nights in the next room even to a coughing consumptive patient will realise how essential separate rooms

are. Here the sanitary arrangements are fairly isolated, and for the most part good, except for the earth closets, which are of a strange and wondrous pattern—that is to say, they are on the soil-pipe plan, this pipe being a 9-inch glazed stoneware one, and as it bends and twists and is jointed to connect to the closet below, the result may be imagined, and I could well believe the doctor when he assured me that they must shortly be abolished and water-closets put in. Two small buildings on the extreme west of the plan are objectionable, being pigstyes, and comfortably placed between the open-air gallery and the scullery. In spite of these objections the buildings are well laid out and built, and as there is no ornament and reasonable precautions are taken to avoid the lodgment of dust, they struck me as in every way better than those at the parent institution, Falkenstein.

4. *Alland*.—This sanatorium, which was opened in 1897, is 30 miles from Vienna, and at present accommodates 118 patients, but the grounds, farm, laundry, lighting, laboratory and other blocks are sufficiently large for a sanatorium for 300, and new patients' blocks will shortly be built to bring the number to this total. This sanatorium is particularly interesting to us in England at this moment, as in present size and completeness it closely approaches the King's scheme. It is intended for patients of the poorer classes, the charges being about 30s. per week for first and 12s. per week for second-class patients. The patients are accommodated in dormitories as at Ruppertshain, but here each dormitory accommodates eight patients, except for six small rooms to accommodate two each. The lay-out of the main patients' block is fairly good as a whole. The sanitary blocks are not, of course, sufficiently isolated for English ideas. But the chief fault lies to my mind in the size of the dormitories, and the fact that each acts as a passage-room for at least one other. As at Ruppertshain, the washing is done in the lavatories and not in the bedrooms, excepting in the case of patients confined in bed, and where dormitories are used, this is the best arrangement, though where separate rooms are provided it is a very vexed question as to whether washing and bathing should be done in the rooms or not. At Nordrach, where great stress is placed upon bathing, each room is provided with a shower-bath, and in other sanatoria a fixed lavatory is placed in each room. The disadvantages in having wash and supply pipes in rooms are obvious. It is better to have all washing and bathing done in separate rooms, allowing washstands and baths, which may be connected only to the first-class of patients and to those too ill to walk to the bath-rooms.

The dining and kitchen block are to the south-east of and rather lower than the patients' block, the ground floor being on a level with the basement of the latter, to which it is connected by a covered way. There are two basements to this block, used for cellars, servants' rooms, offices, &c. This dining-hall is a well placed room, and the cooking arrangements seem excellent. Alland, like the projected King's Sanatorium, has a fine laboratory block with mortuary and dissecting-room, also a scientific library and accommodation for one or two foreign medical men who may wish to visit the place for purposes of study; there is also an electric-light house, laundry and model farm. These are detached from the main building, and as they are similar to those which must be provided for any general hospital, the whole is very well and fully set out in the Alland Sanatorium Association's report, published in Vienna, which contains full plans, diagrams, &c.

5. *Albertsberg*.—I have included this among my slides, for it seemed an interesting plan for an inexpensive poor patients' sanatorium, the cost having been but 125 $\frac{1}{2}$  per bed against 173 $\frac{1}{2}$  per bed at Ruppertshain and 240 $\frac{1}{2}$  at Alland. The dormitories here are for ten beds each, but there are said to be eight single-bedded rooms in the block behind the dining-room. This seems a mistake, for they must, unless the slope in the ground is very great, be somewhat cut off from light and air. Another and very obvious fault is that the open-air galleries are too much sheltered between the blocks; but there seems an idea in the plan, and the use of the dining and sitting-rooms as passages seems an expedient to which no real objection can be taken.

Before leaving these German sanatoria, let me add that they all, except the last, appear too high, having five floors. This, even though the stairs be made easy of go, places too great a strain upon consumptive patients.

Having shown you plans of several German buildings, may I be permitted to show you the plan of a small English sanatorium, namely, that built for the East Anglian Sanatorium Company at Nayland, Suffolk, and of which Dr. Walker is the medical director? This building was originally intended for twenty-eight paying patients, but seven more rooms were fitted up in the roof during construction. Slightly radiating wings were adopted; the angle which these make with the centre has been found to be about right, that is to say, they afford a certain amount of shelter without shutting off the sidelight from the centre. Each wing contains six ordinary patients' bedrooms (10 by 14 by 8 feet 6 inches) on

each floor, and larger bay rooms at each end, those next the open air galleries being given up to staff officers' rooms so that control is always kept over patients in the galleries and also over the corridors. Practically the whole width of the south wall is window from 2 feet 6 inches sill level to the ceilings. A corresponding light is put in right across the north wall of the room above 6 feet high, and again in the corridor opposite, so that a complete blow through can be obtained.

The sanitary blocks are placed centrally behind the patients' blocks, and a nurses' room at each end close to the secondary staircases. The administration block is at right angles to the main block with a passage through to the dining-room which is an almost detached room. The small passage connecting the administration block with the dining-room was originally planned as an open verandah, but after one or two south-westerly gales which had an unfortunate knack of upsetting nurses with trays passing to patients' bedrooms, glass screens had to be fitted, which in really fine and settled weather can be removed. If one short length of corridor open on one side proved itself inconvenient here, it seems to me that a cottage or villa block sanatorium could never be a success in English climate unless the blocks were connected by enclosed passages either above or below ground, or unless each block was provided with kitcheners and full equipment for serving meals, and either of these two expedients would be exceedingly extravagant and there would be no corresponding advantages. Stretching eastwards from the dining-room come the kitchen and offices, with extra larders and stores in a basement under the east end of the block. Here an open corridor is provided, but there is a passage-way through kitchen and pantry, which can be used in windy weather. There is no first-floor over the dining-room and kitchen block. On the first-floor over the administrative block is a pathological room, and sewing and linen-rooms. The front portion of the first-floor is similar to the ground floor. On the top floor on the east side are patients' room, and on the west nurses' and servants' rooms. Owing to the slope of the ground the administrative blocks are midway between the ground and first-floor patients' room, so that patients on either floor have only to go up or down one flight of steps to reach the dining-room.

I have chosen these plans from those available, almost haphazardly. Open air sanatoria are being built all over Europe and North America. They are to be found in Africa, and I learn from the highest authority that Wei-Hai-Wei is considered a suitable position. In Switzerland, of course, are many of the best known ones, though I do not think that these are constructed on the latest and most scientific methods. You will probably have realised how extremely simple the planning of small sanatoria is. Difficulties undoubtedly increase enormously directly the members to be accommodated increase. You are then at once confronted with the question of area covered, and distance from dining-room and kitchen, and the number of floors allowable. As it is exceedingly important that patients should dine in the general dining-room as often as possible, this question of the distance of the patients' rooms from the dining-room is really a vital one. It has sometimes been suggested that the buildings should be built on a great number of floors, and lifts provided. Against this there are two objections—(1) The fear that the lower rooms may ventilate into the upper; (2) the expense of running the lifts, which would have to be very large, as they would be chiefly used in going to and from meals, and therefore by practically the whole of the patients at once.

As to construction, everything that applies to general hospital construction applies here, but an effort should be made not to give the place too much of the hospital air. In this climate verandahs outside the bedrooms are generally considered a mistake. The open-air galleries should be placed either in between the rooms (I have sometimes wondered whether the ideal plan would not be to have one between every alternate room), or at the ends of corridor or quite away from the house. They should not be less than 10 feet deep, and there should be ample space laterally, say 8 feet to each person. When I visited Falkenstein and Ruppertshain the couches in the open-air galleries seemed much too close together.

*Ventilation*.—In some German and some American sanatoria mechanical ventilation is resorted to. But this seems a great mistake—one of the objects of the treatment is the hardening of the patients, and for this there can be nothing better than open windows. Casements opening in have been found the best form of window. Sashes only allow of half the window-space being used for ventilation, and casements opening out are most troublesome and noisy in windy weather. The upper parts of the windows should be hopper hung or on centres, and it is a good plan to have lift butt hinges to the casements so that they may be taken right away in hot weather. Open fireplaces, except for appearance in sitting-rooms, are not advisable on account of the dust, and low pressure steam is generally admitted to be the best form of heating. Hot water would, of course, be preferable, were it

not that in sanatoria the temperature of rooms may fall below freezing, and there is a danger of burst pipes, and as the radiators are chiefly used for a short time while patients are dressing, hot water will not heat them rapidly enough. Besides, with very long, low buildings such as I have been advocating, hot water cannot be efficiently used.

The best position for the radiator in patients' rooms is another point to be settled. I show you three plans of patients' rooms at Falkenstein, at the East Anglian Sanatorium, and at a sanatorium recently designed. The position of the radiator in the last, under the windows, has been severely criticised by doctors as not efficiently heating the room, and the other position is probably the best. The foot of the bed has been suggested, and the place seems an excellent one, were it not for the difficulty of moving the bed. The radiators should be fixed at some little distance from the wall to allow of dusting behind, and should be of such a pattern that a brush can be used between tubes. The doors of patients' rooms and open-air galleries should be made large enough to allow of beds being wheeled in and out with ease.

The flooring of patients' rooms and corridors is a question to which a great deal of attention has been given—smooth, plain linoleum is probably the best for both. Tiles, parquet or mosaic, are excellent, except on account of noise, and this is of the very greatest importance. Sanatoria with long lengths of corridor and a number of rooms having both doors and windows sprung on to them are apt to be so noisy as to have a really bad effect on nervous patients, and everything in the way of rubber door stops, silent window fastenings and noiseless floor coverings must be adopted. Probably the indiarubber flooring now used in banks, &c., would be the best if expense allowed. The floors of the dining-room may very well be of hardwood, and of the open-air galleries unglazed tiles.

Fixed hanging cupboards running up to the ceiling are better than wardrobes, as dust underneath, behind and on the tops of the latter is avoided.

Electric light is, of course, the best form of illuminant, and its advantages are so great that it should be installed almost at any cost. It is necessary to have the fittings arranged so that the lamps shall not swing and be broken by the draughts that blow through the rooms, and, of course, to have the switches in patients' rooms within reach of the bed. It is also well to have at the same point an extra plug, which may be used for keeping plates warm or for a lamp for examining throats. Here also should be fixed the push of the bell to ring in the servants' bedroom.

As to the height of rooms, 8 feet 6 inches or 9 feet at most has been found a good and convenient height. There are many who will criticise this, and it is not in accordance with the custom of continental sanatoria, where rooms vary from 12 feet to 14 feet. The advantages of low rooms are:—(1) The reduction in the height of the building, consequently in the number of stairs; (2) the reduction in the cube, and consequently the cost of the building; (3) the convenience of cleaning, the top corners being easily reached with an ordinary mop; (4) the ease of opening the top lights of windows. With such low rooms the windows must be tight up to the ceiling. After all, if patients are to live in a constant stream of fresh air, it matters not whether that stream is 8 feet 6 inches or 14 feet deep.

Before concluding, may I recapitulate what seem to me the chief points to remember in designing the ideal room of a consumptive patient? The room should face south or south-east, should be ventilated back and front, as should be the corridor behind. The windows should be the full width of the room, and the sill low enough for the patient to see out when lying in bed, and should be carried right up to the ceiling; they should open inwards and to their full extent, as well as being entirely removable. Open fireplaces should be avoided, and the heating provided should be such that the room may be warmed speedily. The doorway should allow the bed to pass. The room should be as close to dining-rooms, bath and water-closet as possible, and separated from them by the least number of steps. The usual hospital precautions against dust should be taken, and the walls and floor should be made as sound-proof as possible. In conclusion, let me recommend to any one wishing to study the subject Dr. F. R. Walter's exhaustive work, "Sanatoria for Consumptives," to which I am indebted for some of the plans shown to-night.

## II.

### Notes on the Construction of a Sanatorium from a Medical Point of View

read by Dr. JANE WALKER:—

In building a sanatorium for the treatment of consumptive patients, we must keep ever before our minds the meaning of the so called "open-air treatment." This term, which has come into very general use, is a convenient one, but is apt to be misleading, for it has led, not only the general public, but even people in authority, to assert that all that is required is open air, and that, if windows are only opened, consumption will diminish, and in time cease to exist.

Now the sanatorium treatment of consumption is a great deal more than this. It is a minute and elaborate system made up of endless details, all of which are important. It is not enough to say, open all windows in all weathers, and all will be well, nor even to add, feed all patients very plentifully. With these two points, essential as they are, must be united careful regulation of exercise and rest and constant medical supervision. No two cases can be treated on exactly the same lines; the sick individual, not the individual sickness, must concern us, in other words the reaction of a patient to his environment is a very important element in the cure of consumption. The moral qualities which most aid consumptives in recovery are, firstly, strength of will; secondly, common sense; thirdly, equability of temperament. Therefore, the essentials in the treatment of consumption are to preserve and strengthen the physique, to enforce prudence and to induce placidity. Hence it follows that a sanatorium which is designed to be an ideal establishment must be arranged (so far as is possible in a mere structure of bricks and mortar) in such a way that not only the physical, but the mental and moral well-being of the patients may be taken into consideration.

In building a sanatorium for a large number of phthisical patients, the points which must be kept specially in mind are that, just as overcrowding and want of sunlight and fresh air are factors in promoting the disease, so abundant space for each patient, and, if it may be so stated, a superabundant supply of fresh air and light are, among the chief means of combating the disease. Abundant sunlight and fresh air are necessary on two grounds: firstly, because they tend directly to kill the organisms of disease; and, secondly, because they increase the patient's power of resistance; whereas, impure air keeps him in a low state of health, and so renders him an easy prey to the inroads of the tubercle bacillus.

There is in some minds a great feeling against treating patients in a sanatorium instead of in their own homes, partly because of the supposed danger of massing a large number of consumptive patients together, and partly because of the fear lest the treatment in a sanatorium should degenerate into a mere routine, by which every patient is treated exactly alike. The first danger is overcome by (in addition to antiseptic precautions) spreading the sanatorium buildings over a large area, in a somewhat isolated spot; and the second by realising that the sanatorium treatment is essentially individualistic. In a sanatorium the treatment of consumption is continuous—it does not consist in prescribing a dose of medicine and then giving no more attention till the following day, but it lies in ceaseless care and attention every minute of the time. For example, the amount of food, the amount of exercise and rest, the time that may be given to employment and recreation, the kind of employment and amusement, and every detail of the daily life is carefully regulated according to the requirements of each individual patient. A good deal of the necessary routine of the open-air treatment is irksome to most patients, and is easier to bear if the sufferer be one of a community all the members of which are undergoing the same strict regimen.

The following conditions are necessary for an establishment for consumptive patients:—The building must be placed on a slope facing south, and at such an elevation above the surrounding country that an air is insured free from the impurities caused by industrial establishments, business or traffic of any kind. The building should be therefore in an isolated district, far from lines of traffic, and should be at a considerable distance from any town or large village. It should be so constructed that patients can be distributed over a considerable space, and that there may be constant and efficient ventilation. The building should be surrounded by woods, meadows and streams, and the farm should be at some distance from the sanatorium.

The sanatorium should be so constructed that the strictest attention can be easily paid to cleanliness; the heating should be by some central system. The greatest restrictions should be placed upon all accessories, such as carpets and curtains, &c., which may harbour dust, and the lighting should be by electricity. But as, in spite of the best ventilation, the air inside a building is never so pure as that without, arrangements must be made to allow of patients spending as much time as possible in the open air, so that the rooms are used practically for sleeping only. In this climate verandahs are a mistake; they keep off sunlight and air. There should be covered shelters either quite away from the house or built as an extension of the corridors.

A very important element in the possibility of constantly living in the open air, and of rational ventilation, is protection from wind. This can best be obtained by placing the building on the slope of a hill at some distance from the top and facing nearly due south. A south wind is rare, and as it nearly always brings rain, it cannot bring dust, and therefore is the least harmful that blows. Another point in the efficient ventilation of the building is the construction and situation of the windows. It is essential that the patients' part of the

building, at any rate, should be only one room thick, the rooms facing south, with a corridor behind, into which open windows facing north. Each patient's room should have practically the whole of the south side window space; the lower part of the window should be of the casement type, as sash windows at the best only allow of half the available space being used as fresh air inlet; the upper part of the windows should be flaps or casements, falling inwards. On the north side of the rooms should be a similar series of upper windows which should be opposite to the windows in the corridor.

In a building such as this, standing in complete isolation, the only source of infection can be from the patients themselves. To eliminate risk from this source as much as possible, all excreta must be rendered harmless, and care must be taken that no infectious disease be able to spread. The means by which this is obtained are by total prohibition of all promiscuous expectation, by providing each patient with a suitable portable spitting flask when he is out of his room and placing a properly fitting cup in each bedroom; by having a disinfecting chamber for furniture, clothes, bedding, &c.; by having walls that can be washed and floors that are impermeable. All these measures should be taken, not only to render the tubercle bacilli harmless, but also to eliminate the various other micro-organisms which endanger health.

Owing to these precautions, the prophylactic treatment of persons of a phthisical tendency, especially children, can go on side by side with that of consumptive patients.

As carefully regulated exercise and rest play important parts in the curative treatment of consumption, it is necessary in an establishment of this kind to have due facilities for carrying out these two factors in the treatment. The great end in view is to strengthen the heart and body muscles, and with this object the building should be surrounded by a sufficient number of paths at varying gradients, some shady, some sunny, and all free from dust. Arrangements should be made for sufficient rest and avoidance of over-exertion by providing a large number of benches and covered seats at intervals along the paths. There should also be a suitable couch in each patient's room, and an ample supply of reclining chairs in all the shelters of a kind which will not be injured if left out in all weathers. The extent and duration of all patients' walks must be fixed daily, and notes taken of patients' pulses, temperatures and conditions as to fatigue, sweating, &c., on their return from exercise. The attention to all these details necessitates constant medical supervision.

The subject of the sanitation of a sanatorium is important. In view of the fact that the Royal Sewage Commission in their interim report practically admit the possibility of bacterial processes producing reasonably good effluents, it would seem that either land treatment, or treatment by one or other of the bacterial processes, might be adopted. The exact method of sewage disposal will depend on the nature of the soil surrounding the sanatorium, and also on the slope of the ground. If the soil be light sandy loam, and the slope and other conditions favourable, land treatment should be preferred. If, on the other hand, the soil be peat or clogging sand, such as Bagshot sand, probably a septic tank, followed by some form of bacterial bed, will be the best method.

Whether land or bacterial process be chosen, a septic tank should be interposed to hold back solid matter, much of which will be liquefied when septic action is started.

In dealing with the land system, some experienced person is needed, who will treat the land carefully, so as not to let it get "sick," and also obtain the best possible results in the way of crops—e.g. cabbages, rye grass or other growths.

If one or other of the forms of bacterial beds is to be used, Dibden's contact bed, Whitaker's continuous process, Duckett's aerobic self-acting continuous filter, or Scott Moncrieff's process may be adopted. It is impossible to say which of these processes is the best, but from the London County Council experiments carried out at Barking and Crossness, it is extremely doubtful if any of them can be relied on to destroy pathogenic germs. In the case of the land effluents the destruction of pathogenic germs could not be relied on, but no doubt mechanical separation of the organisms takes place, and also the process being slow as compared with bacteria beds, pathogenic germs would be more apt to be destroyed.

Considerable difficulty arises if the effluent must go into a watercourse which, in its turn, runs into streams or rivers supplying water which is to be used for drinking purposes. Provided the water is not subsequently to be used for drinking purposes, sterilisation might be disregarded, if the effluent were non-putrescible and incapable of creating any nuisance. Probably the Mersey and Irwell standard will suffice.

But with regard to effluents running into streams used for drinking water, the subject is very complex, and until the Royal Commission on sewage disposal has made some definite pronouncement on the matter, it would be rash to express too definite an opinion. Personally, I should be inclined to say that complete sterilisation, that is, destruction of all spores as well as bacilli themselves, is impracticable, except in a very

large establishment, on account of its extreme costliness. Therefore the point to be aimed at is to consider whether partial sterilisation, to the extent of destroying the tubercle bacillus, is also impracticable. On this point the greatest diversity of opinion exists. Available data do not permit of a definite pronouncement being made. Thermal processes, though on theoretical grounds the best methods, cannot compete in point of cost with chemical methods. The ozone method has been tried, with apparent success, on the Continent, both with water and sewage effluents, but the cost of installation is a serious element. I should feel inclined to advocate the use of chlorine compounds; for example, bleaching powder, or else sodium hypochlorite. These chemicals are cheap; the former can be bought anywhere, and the latter from the United Alkali Company, and they are possessed of conspicuous germicidal properties. But whatever process be adopted, the effluent, to be of any value, must first be brought into a chemically pure condition, such as has been attained by the Mersey and Irwell Board.

To supplement the remarks of Mr. Brewer on the internal arrangements of the sanatorium, I have a few observations on the treatment of the walls. The walls of the bed and sitting-rooms and of the corridors should be painted or colour-washed with some cheap material. It is not advisable to have varnished walls. There is a constant percolation of air through the ceilings and walls of ordinary dwelling-houses sufficient to materially aid in their ventilation. By varnishing walls not only is the air prevented from gaining access to the rooms, but a cool surface is presented upon which in cold weather the warmer air of the rooms condenses and a continual state of moisture of the walls results, which, especially in damp or foggy weather, may be described as sweating. I have found, by personal experience of a varnished bedroom, that all metal things, such as keys, scissors, &c., are continually rusty, and that the room tends to have a damp, musty smell, and that in spite of perpetual open windows. At the Pinewood Sanatorium I was interested to find the other day when I visited it that they have similar difficulties owing to varnished walls. There is constant moisture on the walls, and all their metal things, such as the edges of the temperature chart-holders, get rusty and tarnished, and so much is this the case that they are putting radiators into all the rooms to try and dry them by heat. I doubt myself whether they will not find that the rooms will have to be heated to a high degree, and that constantly, in order to make any appreciable impression whenever the weather is either cold and damp or cold and dry.

The moist condition of the walls is not only unpleasant, but is certainly injurious, as germs tend to breed in moisture, and though varnished walls can be readily washed and cleaned, yet unless they are done most thoroughly every day and every part of the wall is dried, I consider that such accumulations of moisture are a very distinct drawback. It is not so much that the walls are likely to be harbours of the tubercle bacilli, as that anything which forms a nidus for any kind of micro-organism is to be highly deprecated in a building which sets out to be upon correct hygienic principles.

If walls are colour-washed and done again as a routine thing from time to time, and the walls of the bedrooms are done always when a patient leaves the sanatorium, the expense is not great, and the certainty that the walls are clean and aseptic is secured.

The description of the daily *régime* of the sanatorium may not be without interest to many here. Breakfast is at 8 or 8.30 o'clock. Before breakfast the doctor visits each patient, and after hearing how he has slept, and what are the pulse and temperature, maps out the morning in accordance with these conditions. Those patients who are well enough to be out and about take their prescribed amount of exercise some time before 12 o'clock. From 12 to 1 o'clock all patients rest on long chairs, either in their rooms or out of doors. During this hour they are again visited by the doctor, who settles what they may do during the afternoon, and all temperatures are registered at 12 o'clock. At 1 o'clock is dinner, which generally consists of three courses. Each patient is given, and expected to eat, the amount of food provided, for the doctor supervises each helping, and though, in common with many other medical people who have to do with the care of consumptive patients, I do not feed patients so largely as I used to do, yet it is really surprising how cheerfully and willingly patients eat three substantial meals daily when they are out in the open air from morning to night.

After dinner patients again take a regulated amount of exercise, and from six to seven o'clock they rest before supper, which is at seven o'clock, and is on the same lines as dinner, though it is generally a rather lighter meal. During the evening rest hour the patients take their temperatures again, and are again visited by the doctor. Of course, patients who are quite confined to bed, or those who are at all weak, have their meals taken to them, either in their rooms or out in the garden. Those who are quite in bed often require to be fed by a nurse, and therefore in any sanatorium in which any but slight cases

are to be taken, the accommodation provided for nurses must be ample, for in a day such as I have described full of endless small, but important, details, a day so arranged as to guard against the slightest fatigue on the part of the patient, good and efficient nursing is one of the most important points. All patients who are in bed entirely have a visit from the ubiquitous doctor before they settle down for the night. It is of the highest importance to realise the point that in the treatment of consumption the patients must be considered and treated individually. There must be no massing them together, either physically, so far as the building is concerned, or mentally, so far as the doctor is concerned; the ordinary red tape of a hospital routine will not work with consumptive patients. With some the visit of the most harmless and unscintillating old lady will send the temperature up a degree or two; others suffer from boredom, and require, and are the better for, some amusement and the visits of friends occasionally. Four visits a day from one's medical attendant may seem excessive, especially when one is suffering from a complaint which is likely to last for months, if not for years; but it is, in all cases where phthisis is at all active, necessary to watch closely the effect of exercise upon the pulse, temperature and respirations of each patient, and to note at once any signs of fatigue. Probably one of the secrets of the so-called "open-air" system lies not really so much in the open air as in daily, intelligent and tactful management of each individual patient.

Mr. E. T. HALL, in proposing a vote of thanks to the readers of both papers, said the subject was one of great interest, and was engaging the attention of both medical men and architects, especially those architects who practised particularly in hospital work. The King's proposed scheme had given an impetus to the study of the requirements in such work. The great height of German sanatoria was a mistake. It meant much fatigue to patients climbing upstairs, or if lifts were used great cost in the initial outlay. For such buildings two storeys were an admirable arrangement. Adequate centralisation in large blocks was a great difficulty. Verandahs were hard to plan successfully. The better arrangement would be to have the windows carried down to the floor level. If there were many points to admire in the German plans, there were, however, certain things to avoid. The Germans did not seem to adopt the first principles in sanitary administration, a matter that was of the utmost importance. With reference to the size of rooms the speaker agreed with the writers of both papers. High and large rooms were not necessary. A cube of about 1,100 feet was ample in rooms of that type.

Mr. K. D. YOUNG seconded the motion, supported by Drs. Hudson and Wethered, and Mr. Arnold Mitchell.

### THE ARCHITECTURAL MUSEUM AND THE ASSOCIATION.

A SPECIAL general meeting of members of the Architectural Association was held in the rooms of the Royal Institute of British Architects on Monday evening to consider proposals which had been made by the Royal Architectural Museum and Westminster School of Art. Mr. H. T. HARE, president, occupied the chair.

The PRESIDENT, in opening the meeting, said:—The object which calls us together this evening is one of the greatest importance to the well-being of the Architectural Association, and the present meeting promises to be an historical one in its history. It is therefore gratifying to note by the numbers present that the decision to be arrived at will receive the endorsement of a large proportion of our members, and will be no hasty one, but will be considered from all possible points of view. It may perhaps be useful for me to recapitulate the history of the negotiations which have led to the calling of this special general meeting. The need of adequate premises for the work of the Association has been one which has pressed itself upon us for many years, but although it has been felt in the past, I do not think there has been any period in our history at which that necessity has been so urgent as it is at the present moment. Previous to the year 1891 the work of the Association was comparatively limited, and no serious attempt was made at actual architectural education. Two or three rooms were occupied in this building sufficient to accommodate what was then a very small library, and practically no staff except a voluntary one. Our meetings were held in one of the galleries on the ground floor. When the studios and various other classes were established it was necessary to acquire greatly extended accommodation which it was not possible to find here, and the present premises in Great Marlborough Street were taken. These promised to serve our purpose for many years, although lacking the dignity and importance which a Society of this nature should be able to command. The work and scope of the Association, however, increased year by year, and every session more consideration was required in order to arrange for the classes to be carried on smoothly without friction.

Two years ago my immediate predecessor in the chair,

Mr. Seth-Smith, initiated a movement with the object of raising funds for the erection or acquisition of new buildings, and *pari passu* for the establishment of a day school for the training of prospective architects. The former project, though prosecuted with unbounded energy and with a considerable measure of success, appeared to have its realisation largely in the future. The profession of architecture is not in the main a wealthy one, and we cannot look for any very extended support from the general public, who are lacking in interest and appreciation of our art. The funds collected and promised up to the present moment, though amounting to a substantial sum, are still hardly one-quarter of the total which was estimated to be required, and the collection of the remaining three-quarters would probably be a work of some years. The second project, that of the establishment of the day school, has been, however, entirely successful, and is now proceeding in a manner which exceeds the most sanguine hopes with which it was initiated. The numbers attending and the enthusiasm with which the students are prosecuting their studies give every promise for increased success and usefulness in the future. The success of the day school has accentuated the need for more room to an extent which was hardly anticipated, and the want is now so pressing that unless we can secure what we require at once the work must be curtailed and cramped just when circumstances are most favourable for expansion. At this juncture a most fortunate circumstance has occurred, and a proposition has been made to the Association which appears to show the way out of all our difficulties, and this in a manner well within our means. The circular which called this meeting together briefly stated the nature of this proposal, which is that we should take over the buildings now occupied by the Royal Architectural Museum and Westminster School of Art in Tufton Street, Westminster. The majority of us are probably familiar with the building, which has been maintained successfully for a number of years. The premises consist of a large central hall surrounded by galleries containing an immense and unique collection of casts, the value of which it is impossible to estimate, but which probably amounts to many thousands of pounds, together with eight large studios and office accommodation. The Council of the Royal Architectural Museum propose to hand over the whole of these premises to the Association, together with the equipment and collection of casts, without any payment beyond a deficit estimated at about 700*l.*, and on condition that the museum shall be maintained and be accessible to the public, as heretofore. There are one or two minor conditions, but these are not material.

I should, perhaps, explain that the deficit will be mainly attributable to the comparatively sudden closing of the school of art which is carried on in the premises, and which has been a substantial source of revenue. The buildings are held on two leases from the Ecclesiastical Commissioners, one of which expires at Michaelmas 1926 and the other at Christmas 1976, at a total rental of 140*l.* per annum. The rates and taxes amount to about 17*l.* per annum, making a total of 157*l.* per annum. The rental of our present premises in Great Marlborough Street is 380*l.* per annum. Possession of the Royal Architectural Museum can be given to us on March 25 next, and by the terms of our present lease we can vacate the Great Marlborough Street premises on June 24 next by giving notice next Christmas. The proposal and the conditions have been very carefully considered by the committee of the Association in all its bearings, with the result that they are unanimously prepared to accept the gift with gratitude, and the transaction now only requires confirmation by the general body of members. The committee took into consideration the following points:—1. The position of the Royal Architectural Museum and its accessibility. 2. The adequacy of the premises to our requirements. 3. The leases. 4. The alterations required and their expense. 5. The terms of the transfer.

With regard to the first, that of position, we concluded that any disadvantage there might be in position was more than counterbalanced by the fact that the building is universally known throughout the profession, and also one which has an extremely interesting past history. There are also the facts that the museum is in close proximity to the Church House, Westminster Abbey, the Houses of Parliament and other notable buildings, and that the entire district is rapidly improving in all respects. Westminster, too, is fast becoming the home of all kindred societies. As to the second point, that of the adequacy or adaptability to our requirements, there can be no question that there is ample room for all our classes. The only point on which we are in some doubt is as to whether we can arrange to hold our meetings there, or whether it will still be necessary to have them here or elsewhere. We are hopeful, however, that a meeting-room may be arranged on the premises. The Westminster School of Art has for some years been carried on in the studios, so that they are well adapted for the purposes for which we require them. The third point as to the leases, or rather the lease which expires in 1926. This gives about twenty-four years, and we considered that

this period was long enough to warrant us taking the risk of being able to secure a renewal at the end of the term. The fact that the other lease is for a much longer period should prove of some assistance, but in any case it is proposed to approach the Ecclesiastical Commissioners at an early date in order to ascertain what arrangements can be made for extension.

The fourth point is as to the alterations and their probable cost. This question the committee have been unable at present to go into exhaustively, but a sub-committee has been appointed to consider the matter and prepare a report with suggestions. It is evident, however, that the sum which has been collected and promised towards the Premises Fund will not be more than sufficient to carry out all that we shall want. The subscriptions having been given on the assumption that a new building was to be erected, it will be necessary to obtain the sanction of the donors for the fund to be applied to the alterations, but there is no reason to anticipate any difficulty on this score. As to the terms of the transfer, there does not appear to be anything to which exception could be taken on any ground. Beyond the deficit above-mentioned our liabilities are confined to a small compensation to one of the art masters, and the retention of the present curator, whose services will no doubt be of great value to us. The opening of the museum to the public can, it seems to me, only result in benefit to the Association, as it will tend to make it more widely known and appreciated. We undertake no responsibility which the present Council of the museum have not borne since its institution, and the possession of the collection of casts will be of the greatest value in our educational work. In conclusion, I think I have stated the case in its various aspects as fairly as possible, and it seems to me personally, as it has to the committee without exception, that the gift of these premises is the most fortunate circumstance which has occurred to the Association during the course of its long history, and I trust it will prove to be the starting-point for a widely extended sphere of increased usefulness.

I beg now formally to propose that the Architectural Association take over the premises and equipment of the Royal Architectural Museum and Westminster School of Art on March 25, 1903, and accept the conditions named by the Council of the museum, and agreed between the respective solicitors.

The PRESIDENT read several letters from members who, unable to be present, desired to express their confidence in the committee and to support the proposal.

Mr. L. AMBLER formally seconded the President's proposal.

Mr. W. H. SETH-SMITH, who supported the resolution, called attention to the admirable way in which Mr. Maurice B. Adams had brought the negotiations to a successful issue. For thirty years he had held to the Westminster Museum with the faith and enthusiasm of a devotee, and with the prescience of a prophet. He foresaw apparently that the profession would require the collection of casts at some time for the education of young architects, and now that time had arrived. The museum and Westminster School had grouped around them a series of classrooms of the very best type. The main purpose of this building had been to preserve the museum for the architectural profession, and it therefore seemed a legitimate termination for such a school to be taken over by a representative body. Although they might feel that some of the staff of the school could reasonably have hoped to continue their work in spite of the transfer, such an arrangement had been thought impracticable, and the committee had acted as generously as was within their power. Although the future looked full of promise in view of the fact that they were getting these premises as a gift, and that the yearly rental would be lower than that of the premises in Great Marlborough Street, the committee were aware that in the new undertaking the work of the Association could not be properly done at a less expenditure than hitherto.

Mr. MAURICE B. ADAMS said he attended the meeting rather as a listener than as a speaker, but the President had suggested that he should make a few remarks. He said he had never thought that the Association would be able to do in his lifetime what they were proposing to do. He always believed that a change of taste would bring the collection in Tufon Street more into favour and result in the specimens and casts being treasured as examples of English architecture. He did not think there would be a revolution in their work because the Architectural Association had come into possession of the museum. The casts were more like the dry bones of the art, and their value would only be realised when they were brought before students by a capable teacher. No better use, however, could be made of the collection than was proposed. With regard to the transfer of the premises, the speaker said the occasion was a most pleasing one to him. The matter had given general satisfaction, and everybody had co-operated and given aid absolutely for the good of the profession. He did not wish to take the credit of this to himself, for without the assistance of the Council of the museum nothing could have been done.

The other speakers who supported the proposal were

Messrs. F. T. Baggallay, C. F. Hayward, Owen Fleming, E. O. Sachs, T. Blashill, F. N. Reckitt, F. Hooper, H. Satchell, T. H. Watson, Max Clarke, F. Lishman, W. H. White, R. P. Jones, E. Swinfen Harris and Cole A. Adams.

The PRESIDENT said there had been no difference of opinion among the speakers. He quite agreed as to the desirability of retaining the present school of art, but it did not seem possible for the Association to carry out such an undertaking at the present time. The insurance of the lease was under the consideration of the committee. Turning to the financial side, he was quite sure they had no more funds than they would require, and he expressed the hope that all those members who were able to, and who had not subscribed would see their way to do so.

The proposal being put to the meeting was carried unanimously.

The PRESIDENT in conclusion, on behalf of the Association, moved a hearty vote of thanks to the Council of the Architectural Museum for their gift, and particularly to Mr. Adams, for the initiation of the idea. The thanks of the Association were also equally due to Mr. H. Seth-Smith for the part he had taken in the matter and for having started the Premises Fund. It was the subscriptions to this fund which enabled them to take advantage of the generous offer made by the Council of the museum. The total subscriptions towards the new premises scheme amounted to 4,320 $\frac{1}{2}$ l., but they hoped for further additions.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE first of a series of "Craft Evenings," inaugurated by the above Society, was held on the 20th inst., the president (Mr. Butler Wilson) in the chair. Mr. John Wright, of the Royal Painter Etchers' Society, discoursed to the members and their friends on "The Evolution of an Etching." The various processes of etching, aquatint, mezzotint and dry-point were also explained, whilst the making of an etching from its commencement to the completed print was practically demonstrated. Mr. Wright's illustration was followed with great interest, and the attractiveness of his subject was evidenced by the large number of members present.

## ARCHITECT'S FEES.

IN the King's Bench Division of the High Court of Justice on Monday the case of Owen and Another v. Davison, which came before Mr. Justice Ridley and a common jury, was an action by Mr. S. Owen and Mr. George Frederick Ward, architects and surveyors, of 71 Colmore Row, Birmingham, to recover from Mr. Arthur William Davison, a licensed victualler, of the William IV. inn, Camberwell, London, 161 $\frac{1}{2}$ l. commission and expenses for preparing plans for the erection of an hotel at Benfleet, Essex. The plaintiff's case was that instructions were given to Mr. Ward, a member of the plaintiff's firm, by the defendant, in June 1901, when the site of an hotel proposed to be erected at Benfleet was visited. The plaintiffs prepared the plans of an hotel estimated to cost 7,000 $\frac{1}{2}$ l., and charged the defendants 2 per cent. The charge authorised by the Institute of British Architects was 2 $\frac{1}{2}$  per cent., but, as specifications were not prepared, plaintiffs made a reduction of  $\frac{1}{2}$  per cent. The remainder of the sum sought to be recovered was charged for expenses in visiting the site of the proposed hotel and other incidental expenses. The plans were sent to the defendant, who approved of them and returned them with a letter of approval. The defendant's case was that he met a man named Bell who proposed to form a syndicate to erect and finance the hotel, the defendant to procure a license and to undertake the management for one year. Mr. Ward, he said, agreed with the scheme, and defendant understood that the plaintiff firm were to go shares in the profits of the sale of the hotel after it had been fairly set afloat. The defendant never gave any orders on his own account to the plaintiffs. He understood that he was merely a member of a syndicate or partnership who were to share and share alike in the profits of the scheme, to which he was to contribute the site of the hotel and his personal services as manager. The scheme, however, fell through owing to the failure to obtain a license, the local authority requiring an old license to be surrendered in return for the new license. The defendant further stated that he gave up in favour of this scheme a scheme of his own to erect an hotel on the same site, at a cost of 800 $\frac{1}{2}$ l., which was all the outlay he could afford without being financed. The plaintiffs, in reply, denied that Bell was an agent of the firm, or that there was any understanding whatever as to a partnership or syndicate, or that plaintiffs were to finance the scheme. The plaintiffs (Mr. Ward and Mr. Owen) and the defendant gave evidence in support of their different views of the

transaction in dispute, but Bell, the supposed agent, was not called, it appearing that neither side had been able to secure his attendance. The case therefore depended upon the evidence of Mr. Ward and the defendant, which was contradictory, and the jury, it appeared, found it very difficult to decide between them. They commenced the consideration of the case at 1.30 P.M., and after half an hour's deliberation without arriving at a decision were locked up, and did not return into Court till a few minutes to four o'clock, when they gave a verdict for the defendant. In the meantime Mr. Justice Ridley had left the court, and judgment was consequently not entered.

#### MANCHESTER INFIRMARY.

THE first ordinary meeting of the new Board of Management of the Manchester Royal Infirmary was held on Monday in the infirmary board-room. Mr. John Thomson, chairman of the Board, presided.

It was mentioned in the minutes that a bill for £1,898½ presented by Messrs. Simpson & Milner Allen, architects, had been passed, and that the firm had been informed that all questions of fresh plans and building an infirmary on another site would rest with the new Board.

The Chairman said it seemed to him that it would be necessary to ascertain the nature of the offer of an infirmary site in Stanley Grove. He did not propose to interfere with the work of the committee, to which he would refer presently, but he thought it was essential that a letter should be obtained from the Owens College Council making a distinct offer, with any conditions there might be, and enclosing plans of the land which the Council were in a position to offer. The committee which it was proposed to appoint would not be able to make any progress until they had received such a letter.

The Chairman was authorised by the Board to write to the Council of the College on the matter.

The Chairman then proposed that the Board should have a special meeting to appoint one or two committees, as might be thought best, to deal with the acquisition of the new infirmary site and with the sale of the site of the existing infirmary and other important matters, and to have power to engage such legal assistance as might appear desirable.

Mr. Milne expressed the hope that the proceeding with the new infirmary would not be allowed to depend upon the Board's getting rid of the old site.

The Chairman agreed, but said it was necessary to ascertain what restrictions there were, if any, on the old site, so that the Board might know what their asset was.

It was resolved that the Board should meet on Monday next to appoint the committees suggested by the Chairman.

#### TESSERÆ.

##### Moorish Work in Spain.

IN Spain the Arab conquerors first adopted the Roman architecture prevailing in the country, but soon introduced forms familiar to them in the earlier seats of Islam. Thus the great Mosque at Cordoba, built about the end of the eighth century, was at first an eleven-aisled basilica, resembling the Mosque of Al Aksa at Jerusalem, but subsequently lost its original character by additions and modifications in a purer Mohammedan style. Other mosques preserved more closely the form of the Christian basilica, as, for instance, that converted into the church of Sta Maria de Blanca at Toledo. The Moorish architecture of Spain, however, gradually lost the traces of its Romanesque origin. Form was soon sacrificed to decoration, stone and marble gave way to more perishable and less costly materials. The Mussulman taste for ornamentation was displayed in an infinite variety of elaborate and elegant stucco mouldings painted in every colour, in stalactitic ceilings, rare woods and gilded columns. Of the great Palace of Zahra, celebrated in Moorish story, with its 4,300 columns of precious marbles, its painted walls, its roofs of cedar and its gold and azure ceilings, not even a trace now remains. The more humble Alhambra, built of less costly and more perishable materials, with its gardened courts and pleasant fountains, has been more fortunate, and has remained to us as the type of Moorish architecture. It shows the same sensuous enjoyment of life, the same luxurious delight in flowers and running waters that distinguish Mohammedan architecture in all parts of the world. But the Moslems of Spain seem to have almost foreseen the shortness of their tenure and the remorseless persecution which would destroy the very traces of their hated race and creed. They left no such monuments as the mosques of Egypt or the massive edifices of the Pathans of India. It is remarkable, too, that unlike other Mohammedan nations, they raised no time-defying tombs over their illustrious dead. The entire absence of monuments of this nature induces Fergusson to conjecture that there was no mixture of Tartar blood in their

veins. Whether this be so or not, it does seem probable that this absence of sepulchral edifices deprived them of one of the most attractive features of Mohammedan architecture—the dome.

#### John Bacon the Sculptor.

To rebuke the eternal sarcasms about his ignorance of the antique because he had never studied in Rome, Bacon modelled a head of Jupiter Tonans, gave it the exterior aspect of time, and produced it amongst the connoisseurs, who, with one voice, inquired from what temple it had been brought. He often remarked on the affectation of many with respect to the antique, who are without taste for selecting what is really excellent in it. "Call it," said he, "but an antique, and people begin immediately to find some beauty. Look at that figure in the corner of my study, can you see anything in it? Yet many who come here and at first take no notice of it, as soon as they hear it is a cast from the antique, begin to admire. Had I made it a few years ago it would not have produced me a shilling." He found, however, some consolation in contemplating other sources beside the antique for inspiration. "I cannot grasp," he once said, "much less arrange at one time, several ideas. If I have anything distinguishing, it is a knack at expressing an idea single and detached; I stick to my mistress Nature, and she often lends me her hand." "He knew," said one of his sons, "where his forte lay. I have heard him often compare himself to the cat in the fable, that had but one sure trick by which to save herself. He used continually to inculcate the importance of a man's attending to that one point in which he discovered his chief talent to lie, and mentioned himself as an instance of the success attending this principle." When captious remarks concerning the antique assailed him, he consoled himself with the idea that he saw art through nature, and that he approached the dignity of ancient sculpture by the same road which Phidias had walked before him. The boasted antique, he said, was found where he himself was seeking beauty and grace, and that the finest of all those wondrous statues of old was but the result of poetry acting upon the actual form and mind of man. Banks was one of those who taxed Bacon's works with the want of antique feeling; neither in his Mars, his Venus, nor his Narcissus, a soft and graceful figure, would the brother sculptor allow the presence of poetic thought. Flaxman, too, concurred with Banks, and Bacon had little consolation save in his own good opinion of his works, supported by the almost general voice of the country. This indeed was most intelligibly expressed; his studios were filled with commissions, his banker respected him for the weight of his deposits; his name began to be coupled with that of Nollekens among the moneyers on Change, and the India Company seeing his shares in their stock increase, thought that a sculptor who was at once eminent in art and strong in Eastern interest might be employed in recording in marble the actions of their heroes. It was probably his increasing importance which brought on those fits of humility to which Cecil says he was liable. "We are all beggars at the best," said the moralising sculptor, "but we are ready to forget it, and that is one source of our pride. Two beggars stand at a door, the one receives a penny, the other a guinea; it is well if the latter does not begin to imagine reason for the distinction; it is well if he does not swell upon it and turn in contempt upon his fellow. Yet this is but a picture of a man's admiration of his gifts." This suspicious and sordid view of human nature made Bacon, as it well might, fearful of his fortune, and induced him to set a guard upon his feelings and receive with gladness the admonitions of his friends. Whatever might be the moral inferences which he drew from an increase of wealth, it is quite certain that his talent in acquiring it was strengthening, that he had the art of keeping it well together, and surpassed many who thought themselves clever in the way of laying it out to advantage.

#### St. Paul's Cathedral.

Buried amidst a thick-piled city—hampered as its architect had felt himself in planning the western front to suit that narrow aperture called Ludgate Hill—composed as it is of freestone and not of marble, and stained with all the impurities of sea-coal smoke, St. Paul's never fails to fill the mind of the commonest beholder with admiration at its exquisite unity and varied and boundless magnificence. To construct a small work, pleasing at once from its beauty and neatness, is something; but to conceive and unite the many distant and distinct parts of such an immense pile as this into one complete whole, tying them elegantly together with that magic band which is at once their ornament and security, like the sculptured keystone of a triumphal arch, requires a master spirit. There is perhaps no one part of the existing cathedral that equals the celebrated Corinthian portico of Inigo Jones; the merit or Wren lay in observing the proprieties of art—he has few bold masterly hits, few unlooked-for beauties; there is no little space in the pile on which he has, as it were, condensed his strength; his glory lies in the entire structure, in his unrivalled skill

balancing and combining all the members of his edifice into one consistent and harmonious whole. This is to have in architecture a genius of the epic order. "A variety of knowledge," says Walpole, "proclaims the universality, a multiplicity of works the abundance, St. Paul's the greatness, of Sir Christopher's mind. Our noblest temple (St. Paul's), our largest palace (Hampton Court), our most sumptuous hospital (Greenwich), are all works of the same hand." Foreign censure as well as native praise has been exhausted on St. Paul's.

#### Mohammedan Domed Tombs.

The usual process for the erection of these structures is for the king or noble who intends to provide himself a tomb to enclose a garden outside the city walls, generally with high crenellated walls and with one or more splendid gateways, and in the centre of this he erects a square or octagonal building crowned by a dome. This building is generally situated on a lofty square terrace, from which radiate four broad alleys, generally with marble-paved courts ornamented with fountains; the angular spaces are planted with cypresses and other ever-green and fruit trees, making up one of those formal, though beautiful, gardens so characteristic of the East. During the lifetime of the founder the central building is called a Barrah Durrie, or festal hall, and is so used as a place of recreation and feasting by him and his friends. At his death its destination is changed; the founder's remains are interred beneath the central dome. Sometimes his favourite wife lies beside him, but more generally his family and relatives are buried beneath the collateral domes. When once used as a place of burial its vaults never again resound with festive sounds. Perfect silence now takes the place of festivity and mirth. The beauty of the surrounding objects combines with the repose of the place to produce an effect as graceful as it is solemn and appropriate.

#### Pliny on Ancient Art.

The "Natural History" of Pliny is certainly a most interesting, amusing, and in many respects valuable book, but quite as certainly it is one of the most inaccurate that ever was written, abounding in half-knowledge, second-hand information, legendary statements and rubbish of every kind. It is, in a word, the commonplace book of an agreeable, gossiping man, of a wide reading, who took little pains to be accurate, who reported everything he heard with slight examination, who was exceedingly credulous, and who accepted as truth and fact the most ridiculous stories. All is fish that comes to his net. In his chapters relating to artists and art he is singularly devoid of judgment or accurate knowledge; he constantly confuses things together which have no relation to each other, often contradicts himself and becomes at times utterly unintelligible. Yet we are forced to turn to Pliny to give a weight and authority to his words upon art, and to own a deep debt of gratitude to him—not because he is trustworthy, but simply because he alone of all the ancient authors, with the exception of Pausanias, has given us a detailed account of the statues and artists of antiquity. His account of the ancient artists and their works is the fullest we have, and adrift as we often are in a wide sea of conjecture, we are glad to seize upon any straws and fragments "rari nantes in gurgite vasto" of blankness and doubt; seizing here a bit from Pausanias, Herodotus or Lucian, there a waif from Cicero, or a floating fragment from one of the great tragic poets, and glad enough to get upon any such raft as that which Pliny gives us, however leaky and rickety. But seaworthy or trustworthy in emergencies Pliny certainly is not.

#### Nero's "Golden House."

Suetonius gives some curious details of this enormous edifice. In the vestibule stood a colossal statue of Nero 120 feet in height; there were three porticoes, each a mile in length, and supported by three rows of pillars; the garden seems to have resembled a park, and contained an immense piece of water, woods, vineyards and pasture ground, herds, and even wild beasts. On the banks of the lake rose various edifices that resembled towns. In the palace itself the rooms were lined with gold, gems and mother of pearl. The ceilings of the dining-rooms were adorned with ivory panels, so contrived as to scatter flowers and shower perfumes on the guests. The principal banqueting-room revolved upon itself, representing the motions of the heavens; the baths were supplied with salt water from the sea, and mineral water from the Albula, now Solfatara, near Tibur. The buildings of Nero were more destructive, adds Suetonius, to the empire than all his other follies. Cicero had passed a still more severe judgment upon excess. He held no expenses to be really laudable but such as had the public utility in view; as the walls of cities and citadels, arsenals, ports, aqueducts, causeways and others of a like nature. He carried his rigour so far as to condemn theatres, piazzas and even new temples, and supported his opinion by the authority of Demetrius Phalereus, who absolutely condemned the excessive expenses of Pericles in such structures.

Cicero makes different reflections upon the buildings of private persons; for there is certainly a difference to be made in this point, as well as all others, in regard to princes. He is for having persons in the first rank in the state lodged in an honourable manner, and that they should support their dignity by their habitations; but at the same time that their houses should not be their principal merit, and that the master should do honour to the dwelling, and not the dwelling to the master. He recommends to the great men that build, carefully to avoid the excessive expenses incurred by the magnificence of structures, expenses which become of fatal and contagious example to a city; the generality not failing, and making it a merit, to imitate and sometimes even to exceed the great. Palaces thus multiplied are said to do honour to a city. They rather dishonour it, because they corrupt it by rendering luxury and pomp continually necessary, by the costliness of furniture, and the other expensive ornaments required in lofty buildings, which are, besides, often the cause of the ruin of families.

#### GENERAL.

**M. Marcheix** has been appointed a conservator of the Ecole des Beaux-Arts, in succession to the late Eugène Müntz.

The "Cat and Mutton Bridge" over the Regent's Canal is to be reconstructed by the London County Council. The estimated cost of the improvement is 71,800*l*. Bow Bridge is likewise to be reconstructed.

The Bridges Committee, to whom the Oxfordshire County Council delegated powers of settling the design for the Sonning bridges, have decided to carry out the original plans of the architect with lattice girder parapets supported on iron piles, with spans of 50 feet width, and not to incur the additional cost which would have been involved in dispensing with lattice parapets and building brick piers as supports, with less width of span.

**M. Paul Besnard**, the French painter, has received the dignity of a commandership of the order of St. Maurice and St. Lazare, in recognition of his services as president of the exhibition of decorative art in Turin.

The Municipal Council of Paris have arranged to borrow 45,000,000 francs, which will be expended on the improvement of the hospital buildings of the city.

**Mr. Norton P. Otis**, chairman of the Board of Directors of the Otis Elevator Company, has been elected to Congress from the 19th Congressional district, New York.

A Congress of French contractors for buildings and public work has been held this week in Paris.

The Jurors selected by the exhibitors of signboards who will represent artists and manufacturers are MM. Grasset, Jambon, Lalique, Alexandre Charpentier and Frantz Jourdain, architect. The supplementary jurors are MM. Jules Chéret and Binet.

The Rectory House of Pakefield, near Lowestoft, has been rendered uninhabitable by the encroachments of the sea on the Suffolk coast. The lawn, on which the Pakefield "conventions" used to be held, has already been washed away. The Ecclesiastical Commissioners have promised 700*l*. towards a new house if a similar sum is raised by December 1.

**Mr. Batsford** is preparing for publication a folio work on "Old Silver, chiefly English, from the Fifteenth to the Eighteenth Centuries," with notes by Mr. J. S. Gardner, F.S.A. It will contain 120 plates. A part of the payment for each copy will be given in aid of the Children's Hospital.

The Institution of Civil Engineers will hold an ordinary meeting on Tuesday next, December 2, at 8 P.M., when the paper to be submitted for discussion will be on "High-speed Electrical Generating Plant," by Mr. Thomas Herbert Minshall.

The next Ordinary Meeting of the Society of Engineers will be held on Monday next, December 1, at the Royal United Service Institution, Whitehall, when a paper will be read entitled "Depreciation of Plant and Works under Municipal and Company Management," by Mr. Charles H. W. Biggs.

**Mr. Akers Douglas**, Home Secretary and formerly First Commissioner of Works, has been appointed an Ecclesiastical Commissioner.

The Design by Mr. Boscombe John, A.R.A., has been adopted for the memorial of the men of the Liverpool Regiment who fell in South Africa which is to be erected in Liverpool.

**Dr. Goegg**, professor of technology in Geneva, read a paper before the Society of Arts on Wednesday on the Simplon Tunnel.

**Mrs. Baxter**, who was more generally known as "Leader Scott," and was author of several valuable books on Italian art, has died in Florence. She was the daughter of the Rev. William Barnes, the Dorsetshire poet and philologist.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

ASHTON-IN-MAKERFIELD.—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgwater.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

DURBAN (NATAL).—Dec. 18.—Design are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

ECCLES.—Dec. 12.—Plans are invited for the laying-out of an area of land and for erection of dwellings for the working-class on part of such area. Premiums of 50*l.*, 30*l.* and 15*l.* will be awarded in respect of the plans placed first, second and third in order of merit. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

HOLYHEAD.—Dec. 2.—Sketch designs are invited for schools and a teacher's house. The competitor whose designs and terms are approved and accepted by the Board will be appointed the architect. Mr. R. E. Pritchard, clerk, Holyhead.

HULL.—Jan. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

KINGSTON-ON-THAMES.—Jan. 15.—Plans and designs are invited for a central home and cottage homes for children of both sexes in the Kingston Road, in the parish of New Malden. A premium for the first three selected plans of 25*l.*, 15*l.* and 10*l.* respectively is offered. Mr. Jas. Edgell, clerk, Union Offices, Coombe Lane, Kingston-on-Thames.

SURBITON.—Dec. 16.—Designs are invited for erection of a Coronation memorial clock tower near the refuge in the area fronting Surbiton station. Premium 10*l.* 10*s.* Dr. Coleman, chairman, clock committee, District Council Offices, Surbiton.

## CONTRACTS OPEN.

ACCRINGTON.—Dec. 13.—For erection of a parish-room at St. John's Church, Accrington. Mr. Henry Ross, 15 Cannon Street, Accrington.

AMSTERDAM.—Dec. 3.—For supply of—Contract No. 319—Corrugated and flat galvanised iron (soft steel) with appurtenances. Contract No. 70.—Asphalted cast-iron pipes with appurtenances. Contract No. 71.—Corrugated galvanised iron with appurtenances. Contract No. C8.—Galvanised iron (soft steel). Contract No. D8.—Corrugated and flat galvanised iron plating and roofing. Contract No. E8.—Zincd iron wire. Contract No. F8.—Soft steel. Contract No. H8.—Sundry plates, discs, &c. Contract No. 18.—Light rails and chairs with bolts and sleepers. Particulars may be obtained from the firm of Mart. Nyhoff at The Hague.

AUSTRALIA.—Dec. 22.—For erection at Perth, Australia, of a rubbish destructor capable of dealing with forty tons of garbage in eight hours. Mr. W. E. Bold, town clerk, Town Hall, Perth.

BARKISLAND.—Dec. 2.—For erection of a road-roller shed, Barkisland. Mr. R. Clements, surveyor to the Urban District Council.

BARNACK.—Dec. 6.—For erection of walling, wrought-iron fencing and gates, enclosing the new cemetery at Barnack, Northamptonshire. Mr. J. B. Corby, architect, 15 All Saints Place, Stamford.

BEXLEY HEATH.—Dec. 8.—For erection of car-shed buildings. Mr. T. G. Baynes, clerk, Urban District Council, Public Hall, Bexley Heath, Kent.

BRADFORD.—For alterations and additions to Cambridge House, Little Horton Lane, Bradford. Mr. Edgar H. Parkinson, architect, Old Bank Chambers, Bradford.

**WELLINGBOROUGH**.—Dec. 3.—For erection of a wall on the northern side of the Urban District Council's yard in Cannon Street. Mr. J. T. Parker, clerk, U.D.C., 29 Church Street Wellingborough.

THE Skegness Urban District Council have retained Mr. J. R. Elliott, A.M.I.C.E., of Nottingham, to report upon a sewage purification scheme.

MR. R. H. BICKNELL, M.I.C.E., Local Government inspector, has held an inquiry at Lichfield into the application of the City Council for sanction to a loan of 7,000% in connection with the sewerage scheme. The application was the result of a memorial presented to the Local Government Board about a year ago by the Bishop, Dean, residents of the Close and other prominent citizens alleging serious defects in the sewerage system and various other matters. The Corporation thereupon instructed Mr. J. R. Elliott, A.M.I.C.E., of Nottingham, to thoroughly investigate and report generally upon the matter, with the result that the complaints were found to be justifiable, and various works were recommended to put the city into a good sanitary state. The chief works necessary are a new low-level intercepting sewer to effectually drain the low-lying districts, the taking-up and relaying of the sewers that have back falls or insufficient falls, and the provision of manholes, lampshafts and ventilators; in some cases the existing manholes being about a mile apart. The Inspector went thoroughly into the details of the various proposals, and at the conclusion of the inquiry said that he thought the Corporation had met the memorialists very thoroughly, and he wished particularly to compliment Mr. Elliott upon the excellence of his report, and the careful and fearless manner in which he had brought all the matters he considered necessary before the Council. There was no opposition to the application.

**COMPETITION OPEN.**

WORKINGTON.—Jan. 20.—Competitive designs are invited for a public library proposed to be erected in Finkle Street, Workington. A premium of 25*l.* will be awarded to the author of the design placed first in order of merit, and a further sum of 15*l.* will be awarded to the author of the design placed second, and 10*l.* to the architect whose design is placed third. Mr. S. Eaglesfield, borough surveyor, Town Hall, Workington.

**CONTRACT OPEN.**

LEEDS.—Dec. 6.—For street works in Conway View and Conway Mount, in the township of Potternewton; Beechwood Crescent and Welton Road, in the township of Headingley-cum-Burley; Branch Street, Bangor Terrace, Bangor View, Bangor Place, Bangor Grove, Bangor Street, Lytham Grove, Lytham Place and Cow Close Road, in the township of Farnley; also for the macadamising and flagging of St. Michael's Lane, in the township of Headingley-cum-Burley. All particulars may be obtained on application to the City Engineer, Municipal Offices, Leeds.

**NEW CATALOGUE.**

MESSRS. THOS. CRAPPER & CO., of Marlborough Works, Marlborough Road, Chelsea, who hold warrants of appointment from the King and the Prince of Wales, have just issued their new catalogue. It is a handsome and carefully compiled compendium of the high-class sanitary appliances for the manufacture of which the firm has achieved a well-deserved reputation. The book, which consists of upwards of 200 pages, is admirably printed and copiously illustrated, and as the prices of all the goods described are plainly given, it is a book of reference which architects and builders will find of real utility.

**TRADE NOTES.**

ASHURST CHURCH, Steyning, has recently been fitted with the well-known "Small Tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, employing their latest improved economical coil heater.

A LARGE clock, with four dials and striking hours, has just been erected at Sheerness by John Smith & Sons, Midland Clock Works, Derby, to the design of Lord Grimthorpe. The same firm are also making a large clock for the Ripley Co-operative Society's new premises.

MESSRS. W. POTTS & SONS, clock manufacturers, Guildford Street, Leeds, have received instructions to fix a new clock with two external dials at St. Luke's parish church, Harrogate, from the vicar and wardens; a new Cambridge quarter-chime clock for the parish church, Crewkerne, Somerset, and a new clock and bell for the Coronation committee, Haxby, near York.

THE Cranleigh Brick and Terra-cotta Works (E. & A. Miles, Ltd.), of Hazelwood, Cranleigh, Surrey, who supplied about six millions of their facing bricks to the recently completed Christ's Hospital schools at Horsham, have received an order for the red facings and moulded bricks for the Southern Hospital at Carshalton, where upwards of a million will be required, as well as an extensive order for terra-cotta for the same building.

**VARIETIES.**

ALFRED CLUYSENAAR, who was prominent among Belgian painters for his decorative works, died on Sunday last in his sixty-fifth year.

EMILE BRETON, the French landscapist, has died in his seventy-first year. He was the brother of M. Jules Breton, the painter of peasant scenes, who is also a poet.

A NEW factory is being erected in Domingo Street, St. Luke's, E.C. The architect is Mr. R. J. Lovell, of 46 Queen Victoria Street, E.C.

A NEW Liberal Club has been opened in Seymour Road, Higher Crumpsall, by Mr. F. Cawley, M.P., the member for the division. The premises include a large room for public meetings and a billiard-room containing three tables, as well as reading-rooms and card-rooms. It takes the place of a small building which has been in use for seven years.

**BRITISH MANUFACTURE**  
**HIGH-CLASS ENAMELS**  
 For all DECORATIVE WORK.

---

**"O" QUALITY "INDIAN" QUALITY**  
 FOR INSIDE USE. FOR OUTSIDE USE.

---

The attention of ARCHITECTS, BUILDERS, DECORATORS, &c., is directed to the following points in the use of these special Enamels:—

BRILLIANT GLOSS AND HARD SURFACE.  
 EASY FLOW AND MANIPULATION UNDER THE BRUSH.  
 ENORMOUS COVERING PROPERTIES.

USED SATISFACTORILY BY MOST OF THE LEADING DECORATING FIRMS IN THE KINGDOM.

Made in any Tint or Colour required, or may be Tinted with Tube Colour Stainers.

MANUFACTURED BY

**ASPINALL'S ENAMEL, Ltd. New Cross, London, S.E.**

## ILLUSTRATIONS.

LIVERPOOL CATHEDRAL COMPETITION: DESIGN SUBMITTED BY MR. H. A. BRIGGS, F.R.I.B.A.—SOUTH ELEVATION. INTERIOR VIEW LOOKING EAST, SHOWING CENTRAL OCTAGON.

TELEPHONE HOUSE, VICTORIA EMBANKMENT, E.C.

CATHEDRAL SERIES: HEREFORD.—THE NORTH DOOR. A COFFIN LID.

A RUMOUR is afloat to the effect that the site of St. James's Hall and Restaurant, in Piccadilly, is likely to be acquired by an American syndicate for the purpose of erecting in their place an enormous hotel and restaurant, and some colour is lent to the report by the fact that Messrs. Chappell & Co. have secured a lease of Queen's Hall in which to hold their popular concerts.

THE *Pall Mall Magazine* is undoubtedly one of our best illustrated monthly productions. The Christmas number for December is no exception, and is replete with interest from cover to cover. From an architectural point of view, the article with illustrations on seven new cathedrals, viz. Truro, Westminster, Brisbane, Cape Town, New York, Berlin and Liverpool, possibly will be found the most interesting to our readers.

THE altar of the chapel of the Sacred Heart in St. Charles's Church, Upper Ogle Street, London, has now been completed by the erection of the reredos from the designs of Mr. S. J. Nicholl, the architect of the entire work. The reredos forms a screen entirely across the chapel, rising to the springing of the vaulted ceiling, and comprises statues of Our Lord and of four angels bearing the emblems of the Sacred Passion, with tabernaclework and other accessories. The work was executed by Mr. A. B. Wall, of Cheltenham.

THE second meeting of the session of the Chester and North Wales Archaeological Society was held on Tuesday evening last, when Mr. W. Ferguson Irvine (hon. secretary of the Record Society of Lancashire and Cheshire) read a paper entitled "Chester in the Twelfth and Thirteenth Centuries," being notes on a number of recently-discovered documents relating to the city of Chester dealing from the year 1170. The paper was illustrated by excellent lantern slides (made by Mr. Newstead), and by kind permission of the owner of the documents the originals were on view for inspection. Dr. Stolterfoth presided over a small attendance.

M. T. THORNTON, who has for some time filled the post of assistant town clerk for the city of Leeds, was at a meeting recommended to the City Council for appointment to the position of deputy town clerk, which has been vacant since the resignation a little while ago of Mr. C. C. Jolliffe. The salary attached to the office is 450*l.* a year, advancing by yearly increments of 50*l.* to 750*l.* The recommendation was made by the finance committee, over which Ald. Gordon presided. At the same meeting it was decided to increase the salaries of two assistant-solicitors in the town clerk's office from 250*l.* to 300*l.*, and of the third from 200*l.* to 250*l.*
